For Hobbes the definition of the sovereign's authority is effectively the definition of the state. So too for Bodin the concept of absolute and indivisible sovereignty is logically entailed by the very idea of the state, which he defines as the just government, with sovereign power, of several families and their belongings. Bodin claims to have broken new ground by providing a clear analysis of the sovereign authority that must be inherent in any genuine state. He identifies two aspects in particular. First, sovereignty must be perpetual and not the kind of power that is entrusted to someone for a time by people who may take it back again. There cannot be a state where authority is merely delegated to the ruler, and where there is a state it is the fact that lesser magistrates have only delegated authority that distinguishes them most clearly from the sovereign. Second, Bodin goes to greater length in stressing that sovereignty must be absolute and not the kind of power that is hedged in with obligations and conditions. In essence, he concludes, sovereignty is the power to lay down laws that will bind the subjects in a commonwealth but not the sovereign themselves. The sovereign must be able to legislate without their subjects' consent, and cannot be bound by the laws of predecessors, still less by their own laws. It would be logical nonsense to say that a sovereign legislator was bound by the laws of a sovereign.

Bodin declares that law is nothing else than the command of the sovereign in the exercise of sovereign power, a view maintained more recently by analytical jurists in an effort to anatomize law properly so called (see Legal positivism §§1-2). In *The Province of Jurisprudence Determined* (1832) John Austin defines the positive laws of men as the general commands of sovereigns backed up by the threat of sanctions (see Austin, J.). Laws emanate from a sovereign power whenever the majority of the people in a reasonably populous society are in the habit of obeying the legislator, and the legislator in turn is not in the habit of obeying anyone else. Expressed like this the concept of sovereignty has purely analytical significance, and Austin makes no attempt in his legal theory to explain why or when a legislator should be obeyed. He is content to specify that there must be a 'habit' of obedience on the part of the 'bulk' of the people to a superior who is both 'determinate' and 'common' to them all.

Austin also reinforces the point that the legislator must not themselves be in the habit of obeying anyone else. This standard assertion made in one form or another that sovereignty is logically illimitable has attracted widespread criticism. It can seem contradictory for Bodin to write as he does of the sovereign being bound to legislate in accordance with divine and natural laws. If one response is to agree with Austin that this type of requirement imposes moral, not legal, constraints, the same cannot so easily be said with respect to Bodin's claim that the sovereign should also legislate in accordance with the fundamental laws of the state, or to Hobbes' concession that the subject need not obey a sovereign intent on his destruction. It may instead be replied that the legislator is sovereign only so long as they act like a sovereign. But who must decide when they do not, and on what basis? Must it then be said that the state and the law have ceased to exist? To many critics it seems more plausible to recognize that legislators in theory may and in practice often do operate under constitutional constraints which are both fundamental and properly legal.

3 Sovereignty and republicanism

Another standard assertion that has been widely criticized is that sovereignty is logically indivisible. Initially the assertion was made in opposition to the republican ideal of a blend of monarchic, aristocratic and democratic modes of government (see Republicanism). While Bodin and Hobbes do not exclude the possibility of genuinely sovereign rule by popular assemblies, instead merely exhibiting a preference for monarchy, they consider it absurd to talk of a mixed constitution. Restated in the juridical language of sovereignty the republican theory of balanced interests does seem rather less coherent. Yet it is equally apparent that the theory of sovereignty is difficult to apply to the practice of states in which legislative authority is distributed among distinct institutions, particularly where the structure of the state is federal.

The author who did most to reconcile the languages of sovereignty and republicanism was Jean-Jacques Rousseau, writing in the century between Hobbes and Austin. Although Rousseau does not entirely agree with Hobbes' pessimistic account of the nature of human beings, he does accept that discord is an inevitable consequence of the human condition and that the solution lies in the establishment of civil societies. Indeed, for Rousseau, people do not surrender their freedom on entering into civil society but find there the possibility of fulfilment in a life of

virtue and genuine liberty. In his *Du contrat social* (1762) Rousseau makes the famous observation that people are born free but are everywhere in chains, before going on to show how that bondage might be avoided in a properly constituted republic. The crucial requirement is that people must not transfer their sovereignty to the ruler but must retain it for themselves. By adopting the paradoxical position that the people as sovereign legislate for themselves as subjects, Rousseau is able to argue that laws will never be oppressive when enacted by the general will.

In most respects the concept of sovereignty deployed here remains traditional. In particular, sovereign power is still conceived to be absolute. Though Rousseau admits that it must be exercised in keeping with natural law (see Natural law §4) and for the common good, both concessions are consistent with the usual qualifications. In the first case, Rousseau denies that there can be any judge of the conformity of legislation with natural law other than the general will itself. In the second case, he takes the failure to legislate for the common good to show not so much that a sovereign people has exceeded the limits of its authority as that the law is not the enactment of a sovereign people after all. For the general will is not to be equated with the will of the majority, nor even with the will of all. The general will consists in an interpretation of the common good of the society, not in an amalgamation of individual interests.

Sovereignty thus remains unlimited in the usual sense, and Rousseau also understands it to be indivisible. However, now that legislative sovereignty remains with the people the concept no longer excludes the possibility of mixed government. While the people must assent to legislation for the common good, they can be governed by separate agencies which may take any form, though some forms of government will be less likely to engender corruption than others. A good ruler will frame sound laws to introduce for the people’s assent, and by enforcing sound laws will help to shape and preserve a virtuous people capable of exercising the general will. The good ruler will not attempt to encroach on the people’s sovereignty, though Rousseau accepts that in practice this will be likely to happen.

Accordingly, if the problem with Rousseau’s version of sovereignty is that it will seldom exist in reality, it does have the advantage that it could in principle be discovered in any state, including one with a mixed constitution or federal structure. Moreover, the problem can be avoided and the advantage retained if the notion of the general will is abandoned. Austin, for example, is able to identify undivided sovereigns in complex states by focusing on the electors of representative assemblies rather than on the assemblies themselves. Yet the difficulty that still remains is the need to regard the same persons as both rulers and ruled. On this analysis, sovereignty ceases to be an attribute of those who appear to legislate and rule and becomes instead an abstract quality of those who appear to obey and be ruled but who are in fact the ultimate source of authority. As such, the concept of sovereignty must compete with other attempts to explain what it is that gives unity and integrity to states or legal systems.

4 Sovereignty and independence

On the sovereignty model the unity and integrity of states or legal systems is taken to depend not only on the absence of an internal or domestic rival to the unity and superiority of the sovereign, but also on the absence of an external or foreign rival. Where external independence is regarded as a further facet of the internal superiority of the sovereign, the constraints of international law can no more be considered properly legal than the constraints of natural law, and international institutions can at best be considered to have delegated authority. With corollaries like these, the connection between sovereignty and independence has understandably been questioned, especially in an era like the present in which the legitimacy of state activity is increasingly assessed according to the standards of wider communities. Keeping the two aspects of sovereignty distinct is therefore urged as an essential means of avoiding confusion, yet what can scarcely be denied is that sovereignty has historically been associated with the idea of the independent state.

Historians have found the earliest expression of the concept in the observations of the Roman jurist Ulpian, that the *imperium* of the Roman people was transferred to the emperor, that the emperor was not bound by the laws, and that what pleased the emperor had the force of law. But although these statements were not unknown in medieval Europe, it was not until the sixteenth century that the theory of sovereignty was fully developed. Consequently it may be said that the notion of absolute, perpetual and indivisible sovereignty made its first appearance under a monolithic empire and reappeared only with the emergence of the modern nation state. If this is correct, it may well transpire that the concept has had its day. If the idea of the nation state continues to decline as a focus for legal and political identity, the concept of sovereignty seems likely to decline with it.

Space

In some of its uses, the word 'space' designates an empty or potentially empty expanse among things, for example, when a driver finds a space in a crowded parking lot, or when a typesetter increases the space between words on a page. In other uses, 'space' is meant to stand for a boundless extension which supposedly contains everything, or every thing of a certain sort. The former sense is well-grounded in ordinary experience and can be traced back to the etymology of the word (from the Latin word spatium, *meaning 'race-track', or generally 'distance', 'interval', 'terrain'). The latter sense originated in scholarly circles - possibly as late as the fourteenth century - by a bold extrapolation of the former; it does not refer to anything that can be exhibited in sense-perception; and yet, through the influence of Newtonian science on Euro-American common sense, it has become so entrenched in ordinary usage that it is normally viewed as the primary meaning of 'space', from which all others are derived.*

According to Cornford, the 'invention of space' as a boundless, all-encompassing container happened in the fifth century BC*. However, it is more likely to have occurred in the late Middle Ages. At any rate, the idea was rampant in Cambridge in the 1660s, when Newton made it a fundamental ingredient in his framework for the description of the phenomena of motion. In a posthumous paper, Newton stressed that space evades the traditional classification of entities into substances and attributes, and has 'its own manner of existence'. Until the publication of this paper in 1962, philosophers took Newtonian space for a substance, and most of them thought this to be utterly absurd. In view of the role of all-encompassing space in Newtonian physics, Kant opted for regarding it as a precondition of human knowledge, contributed once and for all by the human mind. Newton had written that the points of space owe their individual identity to the relational system in which they are set. Nineteenth-century mathematicians vastly extended this concept of space by conceiving many such relational systems. They thus made it possible for relativity theory to substitute four-dimensional spacetime for Newtonian space and time, and for current string theory to countenance a ten-dimensional physical space. These developments confirm the productivity, but not the fixity, of the knowing mind.*

1 The emergence of space

The invention of space as a boundless, all-encompassing expanse was traced back by Cornford (1936) to the fifth century BC. He argued that Greek geometry, which developed at that time, presupposed such an expanse, and that this was identical with the void postulated by the atomist philosophers. However, the atomists' void, though boundless, is not an expanse that *contains* everything, but rather the nothingness *outside* all things. The relation between space in this sense and Greek geometry is less straightforward. The Greeks conceived of geometry as a study of figures, their properties and relations, not as the science of space. Greek geometrical discourse involved the tacit assumption - eventually expressed in Euclid's postulate - that any two coplanar straight lines meet at a point unless they are both perpendicular to a third straight line. Obviously, if two coplanar straights are almost perpendicular to a third one, their intersection can be enormously far away, and an infinite expanse is needed to make room for all such intersections. However, Aristotle did not see this requirement as a constraint on physical reality; he argued that such an infinite expanse is inconceivable and shrewdly remarked that any construction involved in the solution of a geometrical problem can be made to fit - by rescaling - within the finite expanse beneath the firmament (inasmuch as 'any magnitude whatsoever can be divided in the same ratio as the greatest magnitude' (*Physica* 207b31-2)).

In the late Middle Ages, the idea of space springs up in several writers in connection with God's omnipotence. Catholic authorities condemned the proposition that 'God cannot move the firmament in a straight line'. Yet most theologians were loath to admit the existence of a void beyond the firmament. Thomas Bradwardine came up with the idea of an 'infinite imaginary vacuum' which God can make real (in part), should he decide to move the world. Nicole Oresme also speaks of an 'imaginary infinite and motionless space outside the world' (*c*.1375: 368), but he asserts its actual existence: 'Outside the firmament there is a bodyless empty space in a manner that differs from that of any full and corporeal space' (*c*.1375: 176). According to Oresme, the speed of moving bodies 'is measured in regard to' the said 'motionless imaginary space' (*c*.1375: 372).

By 1600, space had become a familiar ingredient of natural philosophy. In Bruno's words:

> Space is a continuous three-dimensional natural quantity, in which the magnitude of bodies is contained, which

is prior by nature to all bodies and subsists without them but indifferently receives them all and is free from the conditions of action and passion, unmixable, impenetrable, unshapeable, non-locatable, outside all bodies yet encompassing and incomprehensibly containing them all.

(1591: 1.8)

2 Newtonian space

Newton's idea of space stems from this tradition, but it also benefited from the conversion of geometry into a science of space by Descartes. Geometrical figures were henceforth conceived as sets of spatial points meeting specific conditions, each point being identified by its coordinates, that is, its (oriented) distances from three pairwise intersecting infinite planes. By bestowing on the class of oriented lengths on a straight line the structure of an algebraic field (actually indistinguishable from our real number field $\mathfrak{R}$), Descartes managed to express geometrical properties and relations by systems of algebraic equations. He maintained that bodies are really nothing but their extension, because their geometrical properties and relations are the only ones that we can grasp clearly and distinctly (see Descartes, R. §5). But geometry was still too weak to meet the demands of a total geometrization of physics, and Newton began his career as a physicist by 'doing away' with Descartes' 'fictions' (1962: 92). He neatly distinguished bodies from the infinite space in which God created them, which is a repository of points that satisfy the theorems of Euclidean (that is, Cartesian) geometry.

Newton sought to ascertain the forces of nature by studying the motions of bodies in space. The motion of a body can be accurately described by means of the varying coordinates of some suitably chosen points in it. The set of three planes from which such coordinates are measured defines a reference frame. Newton was aware that any usable reference frame must be anchored to a rigid body. But a description of motions referred to such a frame cannot exhibit real forces unless that body rests in space or is known to move in it in a definite way. Newton acknowledges two sorts of force: the force of inertia inherent in each body causes it to move in space with constant velocity in a straight line; and the impressed forces acting on a body cause a change - an acceleration - in its state of motion. An inertial frame is a reference frame anchored to a body free from impressed forces. Newton assumes that every impressed force issues from a body and that if a body *A* acts upon a body *B* with a force f, *A* is simultaneously acted upon by a force issuing from *B*, opposite to f but equally strong. In principle, this assumption should enable one to pick out the inertial frames. The very geometry of space makes it impossible to identify an inertial frame as being at rest, but this has no effect on the study of impressed forces, for the acceleration they cause on a given body displays the same magnitude and direction in every inertial frame, regardless of its state of motion (see Mechanics, classical §2; Newton, I. §3).

3 Philosophies of space

What *is* space? The successes of Newtonian physics forced philosophers to face this question, although it proved impossible to bring space under one of the traditional metaphysical categories. Much needless discussion might have been forestalled had Newton's manuscript 'De gravitatione et aequipondio fluidorum' (On the Gravity and Equilibrium of Liquids) not remained unpublished until 1962. In it he boldly asserts that space is neither a substance nor an attribute of a substance, but has 'its own manner of existence' (1962: 99, 132). There follows a characterization which is reminiscent of Bruno, but which includes an unprecedented feature: according to Newton, each point of space is the particular point it is by virtue of the relations it has to the other points, and the only source of its individuality (*individuationis principium*) is the post it holds in the system of such relations. Thus, Newton's concept of space provides the prototype for what is now known as a (categoric) mathematical structure, which can be roughly described as a collection of objects fully specified by a list of mutual relations.

A conception of space as a purely relational system or mathematical structure was also put forward by Leibniz in his polemic against the view of space as a substance, which he imputes to Newton. Leibniz characterizes space as the abstract order of coexisting things. If we forget the peculiarities of each thing and retain only its '*situation* or distance' to the other things we obtain the notion of the thing's place, which may be taken by anything. 'And that which comprehends all those places, is called *Space*' (Leibniz 1716: §47). But Leibniz abides by the traditional view (rooted in the medieval notion that God must be capable of annihilating any particular creature without essentially affecting the others) according to which everything that exists is either a substance or an attribute of a substance. Since space is neither, he maintains that it is no more than a well-grounded phenomenon, lacking

genuine reality (see Leibniz, G.W. §11). From then on, the debate raged between Leibnizian relationalists and 'Newtonian' substantialists, the former insisting that space must be based on and can only be known through the relations among bodies, the latter pointing out that the one scientifically effective description of bodies and their motions - namely, Newton's - required a logically and ontologically independent space. In particular, Berkeley maintained that space without bodies, 'infinite, immoveable, indivisible, insensible, without relation and without distinction', was 'mere nothing' (Berkeley 1721: §53). On the other hand, Euler (1748), though opposed to Newtonian action-at-a-distance, argued for absolute space as a condition of scientific dynamics.

The tension between relationalism and substantialism is clearly visible in Kant's philosophical development. In his first book he ventured a Leibnizian view based on Newtonian physics: space has three dimensions because bodies attract each other with a force proportional to the inverse square of their distances; if matter had different dynamical properties, space would sport 'other properties and dimensions'; the 'highest geometry' would deal with 'all these possible kinds of space' (Kant 1746: §10). But in 1768 Kant alighted on an idea which, he thought, implied the ontological priority of space over bodies. Take two bodies which are exact mirror images of each other (say, a right and a left shoe, or two molecules of, respectively, laevorotary and dextrorotary glucose). An exhaustive description of the mutual distances between all the component parts of one such body would be identical to a similar description of the other. Therefore, the intrinsic difference between them must depend on the relation of each to space. Thus, space is involved in the constitution of each body. Yet space does not meet the traditional requirements of thinghood: its actual existence would require the 'complete synthesis' of infinitely many parts - an impossible task. Moreover, each part of space is infinitely divisible into further parts, so when all relational bonds are removed no substantive foundation remains on which they might rest. Kant solved this philosophical difficulty - and many others - by conceiving space as a 'form of sensibility': 'not something objective and real, not a substance, nor an attribute, nor a relation, but a subjective and ideal sort of scheme for mutually coordinating all external sensations in every way, which issues from the nature of the mind according to a stable law' (Kant 1770: §15D). Since bodies depend on space for their very being, they do not exist in and of themselves, apart from the mind, which is the source of spatial order; they are mere appearances of an underlying reality, which eludes our senses. In the *Critik der reinen Vernunft (Critique of Pure Reason)* (1781, 1787), Kant acknowledges that such underlying reality, though undeniable, is also inaccessible to our intellect, which can only be guaranteed to work within the bounds of sense experience. Space is now described with greater precision as a 'form of appearance', a condition imposed by the mind on sense impressions which *allows* them to be ordered in certain relations by the understanding and thereby to be grasped as presentations of objects. This provides a welcome explanation of the purported fact - which Kant took for granted - that all bodies comply with the truths of geometry and that these truths can be known a priori, ahead of experience. For, as Kant saw, geometric theorems do not simply flow from definitions and the truths of logic (they are 'synthetic', not 'analytic', statements) (see Kant, I. §§4-5).

Although Kant was the most influential philosopher of modern times, his doctrine of space was not adopted by any major thinker except Schopenhauer. Thanks to Kant's critique, the rigid substance- attribute ontology carried no weight in the nineteenth century. Therefore, the primacy of space over bodies no longer appeared to threaten reason and even morality, as it had in the eyes of Leibniz, Berkeley and Kant. But the formulation of new geometries that contradicted the Euclidean canon (see §4 below) undermined Kant's view of geometry as a non-empirical science providing the descriptive framework required for empirical research. Kant's view is not endangered by the existence of consistent axiomatic theories about points, lines and planes containing the negation of some of Euclid's theorems. Indeed, Kant's claim that geometric theorems are synthetic a priori statements entails that there must be such theories. But after several alternative geometries became known, most researchers felt it was only fair that experience should be called upon to decide between them.

In his youth, Russell (1897) proposed a curious compromise on this issue. He retained the classical affine structure of space - supporting the notion of 'constant direction', and hence of straight line - as an apanage of reason, while leaving to experience the choice between three distinct metric structures - supporting alternative concepts of distance and size - which Klein had proved to be compatible with the said affine structure, namely, the Euclidean, in which the three internal angles of a plane triangle are always equal to two right angles or 180°, and two non-Euclidean ones, in which the said three angles always add up to, respectively, less than or more than 180°. Later Russell called this arrangement 'somewhat foolish' because it excludes the Riemannian geometries of

variable curvature employed in Einstein's gravitational theory (see Relativity theory, philosophical significance of §4; Spacetime §3).

In an unpublished fragment written in about 1893, C.S. Peirce emphasized the utter unlikelihood that, among the infinitely many values in any neighbourhood of $180°$, the sum of the three internal angles of a triangle should always settle exactly at $180°$ (Peirce 1931-58: §1.130). Similar reflections may have inspired, in part, Poincaré's innovative thesis on the conventionality of geometry. For him, any consistent geometry can be used in physics, provided it is comfortable. Euclidean geometry meets this requirement because the motions of ordinary solids agree fairly well with the translations and rotations of rigid figures in Euclidean three-dimensional space. Thus, Euclidean geometry, in which all triangles have internal angles adding up to precisely $180°$, constitutes a useful idealization of experience, but it would be ridiculous to claim truth for it (see Poincaré, H.J. §3).

In Newtonian physics, the geometry of space plays a dynamical role through the law of inertia: a force-free particle moves along a straight line, traversing equal distances in equal times. Thus, we may say that space fixes the norm of default dynamical behaviour. Why does matter comply with it? The very idea that uniform, inert space can thus be 'read' at each point by bodies as an infinitely rich but perfectly definite network of routes seems, at first blush, nonsensical. Mach (1883) proposed that inertial behaviour was caused by the presence of very distant masses. From this standpoint he criticized the water-bucket experiment devised by Newton to show the difference between relative motion and 'true' motion in absolute space. In this experiment, a bucket filled with water is made to rotate. Initially the rotation of the bucket is not communicated to the water; the latter therefore rotates relative to its container; its surface remains flat. But as soon as the water acquires the bucket's rotation, that is, as soon as it is again at rest relative to its container and moves with it in space, the surface takes a concave shape. Mach notes that 'moving in space' is here just Newton's idiom for 'moving relatively to the bulk of matter'. He wrily comments that the outcome of the experiment might be quite different if the bucket had lead walls that were one mile thick. Mach did not provide a viable alternative to Newtonian dynamics, but his view of inertia deeply influenced Einstein's quest for a relativistic theory of gravitation (see Relativity theory, philosophical significance of §6; Einstein, A. §3). Einstein, indeed, worked with two ideas that Mach never dreamed of using: he substituted spacetime for space-plus-time as the arena of nature, and Riemannian for Euclidean geometry. This was made possible by the mathematical developments sketched below.

4 General spaces

Bourbaki defined the mathematical concept of 'structure' for the sake of ordering and classifying the rich and intricate concept jungle generated by mathematicians since 1800 (Bourbaki 1970). As noted above, space - as understood by Newton in the wake of Descartes (and Euclid) - furnished a prototype for that concept. However, not every structure is called a 'space' by mathematicians. They reserve the word for structures which somehow resemble Newtonian space because they involve a notion of distance ('metric' spaces), of straightness ('affine' and 'projective' spaces), or of neighbourhood and continuity ('topological' spaces). The conception of such general spaces owes much to Grassmann's *Die lineale Ausdehnungslehre (The Theory of Linear Extension)* (1844), Riemann's lecture 'Über die Hypothesen, welche der Geometrie zugrunde liegen' (On the Hypotheses which lie at the Foundations of Geometry) (1854) and Klein's so-called Erlangen Programme (1872). We shall briefly comment on the latter two (for applications, see Spacetime).

New geometries flourished in the nineteenth century. Most famous outside mathematics is Lobachevskii's non-Euclidean geometry, which took over all the explicit and tacit assumptions of Euclidean geometry except Euclid's postulate, which was replaced by its denial. Much more influential, however, was the projective geometry of Poncelet (1822), which added a 'point at infinity' to each Euclidean straight. This point is the intersection of a family of parallels and can be reached by travelling along any of them in either direction. Because of this last feature, the neighbourhood systems - the topology - of projective and Euclidean space are drastically different. The power and elegance of projective geometry led nineteenth-century geometers to view ordinary geometry as the theory of a truncated projective space. Klein proposed to bring all past and future geometries under a single unifying standpoint. This was supplied by the notion of a transformation group acting on a space. Let S be the set of all points in Euclidean space. A transformation of S is a bijection of S onto itself, that is, a mapping f which assigns to every $p \in S$ an exclusive 'value' $f(p) \in S$ so that every $q \in S$ is thus assigned to some $p \in S$. It is clear that (1) the identity mapping i that assigns each point $p \in S$ to itself is a transformation of S; (2) if f and g

are transformations, the composite mapping *gf* which assigns to each $p \in S$ the value assigned by *g* to *f*(*p*) is also a transformation; (3) for every transformation *f* there is an inverse transformation *f′* such that $f'f = ff' = i$. Conditions (1)-(3) entail that the set of all transformations of *S* constitutes a group in the standard algebraic sense. Call it T_S. Let $f \in T_S$ and let *R* be an *n*-ary relation on *S*. We say that *f* preserves *R* and that *R* is invariant under *f* if whenever *R* holds between $p_1, \ldots, p_n \in S$ it also holds between $f(p_1), \ldots, f(p_n)$. If every transformation of a group *G* preserves *R* we say that *R* is an invariant of *G*. Though no significant geometrical relation is an invariant of T_S, distinct sets of geometrical relations turn out to be the invariants of different subgroups of T_S (a subgroup is a subset of a group which is a group in its own right). Thus, a short reflection will show that all transformations which map continuous paths onto continuous paths form a group; that collinearity of points and the mutual intersection between straights are invariants of a subgroup of that group; and that congruence of segments and angles are invariants of a subgroup of the latter. The invariants of a group determine a structure which is studied by a geometry. Different groups acting on the same arbitrary set of points will organize them into very different structures. In particular, Klein showed that Euclidean and Lobachevskian geometry study the invariants of different subgroups of the projective group. Poincaré concluded that the choice between them is conventional, for ‘the existence of one group is not incompatible with that of another’ (1887: 90).

While Klein sought to reorganize geometry as a branch of pure mathematics, Riemann’s chief aim was to make it more responsive to the needs of physical research, to replace the Euclidean-Newtonian straitjacket with something much more pliable. Physicists write nature’s laws as differential equations involving time and three spatial coordinates. It may seem that they thereby assume that physical space is homeomorphic (topologically equivalent) to $\Re^3$, the structured set of ordered triples of real numbers. However, the stated assumption is unnecessarily strong. Physicists need only coordinatize a finite region surrounding the objects under study. They must therefore assume that each point of space has a *neighbourhood* homeomorphic to $\Re^3$. But such neighbourhoods may be pieced together in a global structure that is very different from $\Re^3$, just as the patches mapped by cartographers onto the *flat* pages of an atlas jointly form the surface of the earth, which is homeomorphic to a *sphere*. Physical space should therefore be regarded as a threefold instance of what Riemann called ‘*n*-fold extended quantities’. A good explication of this notion is supplied by our current concept of a ‘real *n*-dimensional differentiable manifold’, that is, a topological space *M*, every point of which has a neighbourhood homeomorphic with $\Re^n$ which is mapped bijectively and bicontinuously onto an open region of $\Re^n$, so that (1) every point of *M* lies in the domain of one of these mappings or ‘coordinate systems’, and (2) if two such coordinate systems, *g* and *h*, have overlapping domains, the ‘coordinate transformations’ gh^{-1} and hg^{-1} are differentiable. (Here h^{-1} designates the inverse of *h*, that is, the mapping that assigns to each real number *n*-tuple in the range of *h* the point $p \in M$ such that the said *n*-tuple is *h*(*p*); differentiability is required in order to write laws as differential equations.) A particle’s trajectory in *M* can be described by a mapping *f* of a time interval into *M*. The mapping *f* must be differentiable in the following sense: if its range lies within the domain of a coordinate system *g*, the composite mapping *gf* (which yields the *g*-coordinates of successive positions of the particle) is differentiable. The quantitative description of motion requires that such trajectories have definite lengths. Riemann thought that the length of a real trajectory depends on the interplay of forces acting on and about it. The success of the standard definition of lengths expressed in Pythagoras’ theorem betokens its approximate validity on the human scale. But it could well break down on a larger or smaller scale. Physicists should therefore wield a more flexible definition, enabling them to give - whenever experience makes it advisable - a more accurate description of motions. This is secured by Riemann’s concept of a ‘metric’ on the manifold *M*. Roughly, a metric is a rule for measuring, at each $p \in M$, the velocity of every conceivable trajectory through *p* in such a way that the velocity varies smoothly, if at all, along the trajectory. Along a trajectory of velocity 1, the integral of the velocities measures the length of the trajectory. Since a metric based on Pythagoras’ theorem had until then proved suitable, Riemann thought that for the time being one ought only to allow metrics that agree to first order with the Pythagorean metric on a neighbourhood of each point. Such metrics are called ‘Riemannian’.

Spacetime

Spacetime is the four-dimensional manifold proposed by current physics as the arena for Nature's show. Although Newtonian physics can very well be reformulated in a spacetime setting, the idea of spacetime was not developed until the twentieth century, in connection with Einstein's theories of special and general relativity. Due to the success of special relativity in microphysics and of general relativity in astronomy and cosmology, every advanced physical theory is now a spacetime theory. Spacetime *is undoubtedly an artificial concept, which our hominid ancestors did not possess, but the same is true of Newtonian* space *and* time*.*

1 A world of events

Newtonian physics conceives the course of nature as the motion and change in time of bodies located in space (see Mechanics, classical §1; Space §2). Einstein's special theory of relativity implies that the shape of bodies and the order of succession of their changes varies with - 'is relative to' - the reference frame adopted for describing them (see Relativity theory, philosophical significance of §2). Hermann Minkowski (1909, 1915) showed that a unique - 'absolute' - description of natural phenomena consonant with Einstein's theory can be achieved by analysing them into instantaneous events-at-a-point. Such events typically constitute the history of ordinary lumps of matter but they may also occur - in the guise, say, of oscillations of the electromagnetic field - in a perfect vacuum. *Spacetime* is our name for the four-dimensional continuum of such events (Minkowski called it *the world*). It can be regarded - in infinitely many alternative ways - as compounded of one-dimensional time and three-dimensional space. Indeed, each one of the inertial reference frames privileged by classical physics and special relativity defines a distinct way of splitting spacetime into time and space. No wonder, then, that the spatial groupings ('bodies'), and the time series into which events coalesce relatively to each such reference frame differ, from one frame to another. At first Einstein viewed Minkowski's approach somewhat disparagingly, as a 'formalism' which made calculations easier but contributed no genuine insight. However, Einstein's subsequent development of a theory of gravity ('general relativity') is inconceivable without Minkowski's achievement (see Einstein, A. §3).

2 Minkowski spacetime

Should we decide to regard all natural phenomena as embedded in some sort of continuum, a four-dimensional spacetime is a much more obvious choice than a three-dimensional space lasting through time. Imagine a butterfly flying: one may eventually succeed - after much work - in *analysing* this phenomenon into a succesion of infinitely many instantaneous postures, but it is originally *given* as a single coherent spacetime flow. Nevertheless, Minkowski's conception of spacetime does not stem from this intuitive idea, but rather from reflecting about the numerical representation of phenomena in the new kinematics proposed by Einstein (1905). Let P_1 and P_2 be two points marked on a rigid rod *R* at rest in an inertially moving laboratory *L*. Let E_1 and E_2 be events at P_1 and P_2, respectively. Let *L* be furnished with a time coordinate *t*, defined by Einstein's radar method, and a Cartesian system of space coordinates *x*, *y*, *z*. Let (x_1, y_1, z_1) and (x_2, y_2, z_2) be the coordinates assigned in this system to P_1 and P_2, and let t_1 and t_2 be the times of occurrence of E_1 and E_2. Then, the lapse of time between E_1 and E_2 is given by $\tau = | t_1 - t_2 |$, and the distance λ between P_1 and P_2 is given at all times by the positive square root of $(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2$. Consider now a laboratory L' furnished with a time coordinate t' and a Cartesian system x', y', z', based on the same measurement units as the unprimed coordinates of *L*. For simplicity's sake, we assume that

(i) at some instant, the origin of the primed and the unprimed Cartesian systems coincide;
(ii) at that instant the axes of the unprimed system are aligned with the homonymous axes of the primed system;
(iii) this coincidence occurs at time $t = t' = 0$.

Suppose that *L* moves relatively to L' in the direction of the x'-axis, with constant speed v. Let (x'_1, y'_1, z'_1) and (x'_2, y'_2, z'_2) be the coordinates assigned in the primed Cartesian system to two simultaneous positions of P_1 and P_2 in L'. The distance λ' between these two positions is equal to the positive square root of $(x'_1 - x'_2)^2 + (y'_1 - y'_2)^2 + (z'_1 - z'_2)^2$. However, unless $v = 0$, $\lambda' < \lambda$ ('length contraction'), for $\lambda' = \lambda\sqrt{1-(v/c)^2}$ (where c denotes the constant speed of light *in vacuo*, expressed in the units employed in the definition of our coordinate systems). Relative to L', the time lapse τ' between E_1 and E_2 is equal to

$| t'_1 - t'_2 |$. Unless $v = 0$, $\tau' > \tau$ ('time dilation'), for $\tau' = \tau / \sqrt{(1 - v/c)^2}$. Thus the two fundamental kinematic quantities of length and duration turn out to be relative to the inertial frame of reference chosen. On the other hand, as Minkowski observed, the following equation holds always, even if we lift the simplifying restrictions (i)-(iii) and we allow *L* to move in L' with constant speed in *any* fixed direction:

$$(x_1 - x_2)^2 + (y_1 - y_2)^2 + (z_1 - z_2)^2 - c^2(t_1 - t_2)^2 = (x'_1 - x'_2)^2 + (y'_1 - y'_2)^2 + (z'_1 - z'_2)^2 - c^2(t'_1 - t'_2)^2 = \sigma_{12}$$

The invariant quantity σ_{12} is the *spacetime interval* between events E_1 and E_2. If $\sigma_{12} < 0$, the last term must be larger than the sum of the other three, in which case σ_{12} is *timelike*. Likewise, σ is *spacelike* if $\sigma_{12} > 0$. Finally, σ_{12} is said to be *lightlike* if $\sigma_{12} = 0$, for only in this case can one of the events be the emission and the other the reception of a light signal that travels *in vacuo*. The kinematics of Einstein (1905) can therefore be conceived as the geometry of a four-dimensional continuum, a locus of events - Minkowski's 'world' or spacetime - characterized by the display equation. Since the change of the primed into the unprimed coordinates can be effected by any transformation of the Poincaré-Lorentz group (see Relativity theory, philosophical significance of §1), the said geometry can be characterized, from Klein's standpoint, (see Space §4), by the action of the Poincaré-Lorentz group on a manifold homeomorphic to $\mathbb{R}^4$. It can also be characterized, from Riemann's standpoint (see Space §4), by conferring on such a manifold a Riemannian metric η that can be - inelegantly but accurately - described as follows:

(a) if E_1 and E_2 are simultaneous in a given inertial lab *L*, then σ_{12} is the squared length assigned by the metric η to a straight line joining the locations of E_1 and E_2 in the relative space of *L*;
(b) if E_1 and E_2 are events in the history of an inertial particle *p*, then σ_{12} is the squared length assigned by the metric η to the spacetime trajectory - the 'world-line' - of *p* between E_1 and E_2.

Because spacetime intervals can be negative or zero, the said metric η is not a standard Riemannian metric and is sometimes described as *semi*-Riemannian. In a manifold endowed with a Riemannian metric, one can discriminate between curves with or without a steady direction. The former are called *geodesics*. Thus, on a plane the geodesics are straight lines, on a sphere they are great circles. In Minkowski spacetime, the world-lines of inertial particles and light-signals *in vacuo* are geodesics. At each point of the manifold the metric determines a quantity called the *curvature scalar*, which is constant $= 0$ on a plane, $= 1/r$ on a sphere of radius *r*. In Minkowski spacetime the curvature scalar is 0 everywhere, so we say that it is *flat*. (It is perhaps worth noting that the flatness or deviation from flatness of a Riemannian manifold $\mathcal{M}$ is measured by the so-called *curvature tensor*, whose value at each point *p* of $\mathcal{M}$ is expressed - relative to a coordinate system defined on a neighbourhood of *p* - by an *array* of real numbers. The curvature scalar generally conveys less information than the curvature tensor, on which it depends. However, if every term of the array equals 0 everywhere, the curvature scalar is also constant and equal to 0; and if $\mathcal{M}$ is two-dimensional the said array has only one term, equal to the curvature scalar.)

3 Curved relativistic spacetimes

Prompted by the radical incompatibility between special relativity and Newtonian gravity, Einstein worked from 1907 on a theory of gravitation. He was guided by the assumption - known as the *equivalence principle* - that an observer in a closed laboratory has no way of telling whether the lab moves inertially, or falls freely in a uniform gravitational field. If the world were filled by a uniform gravitational field it could therefore be regarded as a Minkowski spacetime in which freely falling particles are constrained by gravitational forces to stick to geodesics. But real gravitational fields are not uniform, and the equivalence of free fall and inertial motion holds only approximately. This suggested to Einstein the following bold analogy: just as the Riemannian metric of a sphere is approximated on a small neighbourhood of each point by the Pythagorean metric of the Euclidian plane (see Space §4), so the (semi-)Riemannian metric of real spacetime is approximated on a small neighbourhood of each event by the flat Minkowski metric η. But the actual metric is not flat: it deviates more or less from flatness according to the presence or absence of matter. Freely falling particles follow geodesic world-lines as determined by this metric. Thus, gravitational phenomena depend, *through the geometry*, on the distribution of matter. The theory finally attained by Einstein (1915, 1916), known as 'general relativity', roughly fits this scheme (although its equations admit solutions in which the density of matter is equal to 0 everywhere and the law of geodesic free fall generally holds only for uncharged spinless particles). Celebrated until *c.*1950 chiefly for its beauty, it has since then enjoyed a spectacular run of experimental successes which place it far ahead of other available theories of

gravity (on the other hand, it is incompatible with the currently accepted quantum theories of non-gravitational forces). The theory turns on a system of differential equations, the *Einstein field equations* (EFE), in which the spacetime metric is the unknown and a particular distribution of matter is assumed. Under different assumptions, the equations yield diverse solutions, which is why one usually speaks, in the plural, of relativistic spacetimes.

4 A wealth of worlds

Philosophers have been greatly exercised by the many surprising alternative ways of conceiving the overall structure of spacetime offered by general relativity. Assuming that the density of matter ρ is always and everywhere roughly the same, Einstein (1917) obtained the first cosmological solution of the EFE: a spacetime that can be decomposed into a succession of geometrically identical slices of simultaneous events, homeomorphic to the three-dimensional sphere $\mathbf{S}^3$. This was hailed as a solution of Kant's antinomy concerning the world's size, for Einstein's spherical space is finite and yet, being boundless, it poses no questions about what lies beyond it. But Einstein's world clashes with the redshift noticeable in radiation from extragalactic sources, which would indicate that ρ is decreasing. It is, moreover, an unstable limiting case of a family of solutions found by Friedmann (1922, 1924), under the less stringent assumption that ρ is spatially uniform but may vary with time. A generic Friedmann world will either

(i) contract indefinitely,
(ii) expand indefinitely,
(iii) expand for a finite time and then contract.

Cases (ii) and (iii) could agree, to a first approximation, with the world as we see it. They share this feature: ρ increases beyond all bounds within a finite time as we go back into the past along any world-line of matter. Since the metric is undefined unless ρ is finite, spacetime cannot contain a point at which $\rho = \infty$. Hence at present only a finite time *T* has elapsed along each world-line of matter. Friedmann called *T* ' the time since the creation of the world' (1922: 384), and some writers believe that his work lends scientific support to Genesis 1: 1. Be that as it may, one should bear in mind that *every* given moment in a Friedmann world is preceded by *some* time, no matter how short, Thus, his cosmology solves Kant's antinomy concerning the world's duration, for Friedmann time is finite and yet, having no beginning, it raises no questions about what was the case before it.

Less realistic but no less exciting is a family of solutions of the EFE discovered by Gödel (1949a), characterized by the presence of closed (potential) world-lines. If one of these happens to be the world-line of a conscious particle, it will re-experience its past infinitely many times as it lives on into the future (see Time travel). Opinions on this matter are divided between those who believe with Gödel (1949b) that the mere conceivability of such relativistic worlds should affect our understanding of time, and those who think that those features of an abstract mathematical structure which in a realistic model constitute a plausible representation of time may well not have any significant analogy with time in other models (see Time §3).

Earman (1995) surveys the whole range of such relativistic 'monsters'. Particularly interesting for the philosopher are the 'observationally indistinguishable spacetimes' discovered by Glymour (1972, 1977). Let us say, with Malament (1977), that two solutions of the EFE, $\mathcal{W}_1$ and $\mathcal{W}_2$, are *weakly observationally indistinguishable* if for every event x_1 in $\mathcal{W}_1$ there is an event x_2 in $\mathcal{W}_2$ such that the spacetime region $\mathcal{I}^-(x_1) \subset \mathcal{W}_1$ from which slower-than-light signals can reach x_1 is isometric with the region $\mathcal{I}^-(x_2) \subset \mathcal{W}_2$ from which slower-than-light signals can reach x_2. This entails that observers in $\mathcal{W}_1$ cannot learn from experience whether they live in $\mathcal{W}_1$ or in $\mathcal{W}_2$, although it may occur that $\mathcal{W}_1$ and $\mathcal{W}_2$ do not share some very important global properties (for example, the existence of closed world-lines).

Spain, philosophy in

Historians have argued about precisely when to date the commencement of Spanish history proper, rendering dubious any reference to Spain as such in the period prior to the official constitution of nationality. If this is the case, one can not really speak of philosophy in Spain before 1474, although it remains a fact that philosophy had been practised on the Iberian Peninsula from the earliest times. During the period of the Roman Empire, distinguished philosophical figures included Lucius Annqeus Seneca; under Visigothic rule, Saint Isidore of Seville came to the fore; and the Islamic Empire featured some of the most eminent philosophers of the Arabic and Judaic traditions, such as Ibn Hazm, Averroes, Ibn Gabirol, Yehuda Ha-Levi and Maimonides. There is no doubt that the centre of philosophical activity within the peninsula during the Middle Ages was the so-called School of Translators of Toledo, where numerous thinkers from many countries gathered. Together with Spanish scholars such as Domingo Gundisalvo and Juan Hispano, they collaborated in making Greek philosophy available to the countries of Europe; instrumental in this process were Gerard of Cremona, Daniel of Morlay, Alexander Neckham and Michael Scot.

After Spanish nationality was constituted under the Catholic Monarchs (1474-1516) on the basis of a single, unified faith, philosophy was destined to become closely linked with religion. During the sixteenth century, this gave rise to a burgeoning of philosophy of the very highest order, which followed two separate paths: that of the Erasmian-style Renaissance, featuring Luis Vives, which developed in line with the vanguard of the European Renaissance; and that of Spanish Scholasticism, which was fuelled by the thrust of the Counter-Reformation on the one hand, and by the discovery of America on the other. After the reigns of Charles I and Philip II (the chief protagonists in the creation of the empire 'in which the sun never set'), the seventeenth, eighteenth and nineteenth centuries witnessed a relentless decline which, towards the beginning of the twentieth, seemed to come to an end. The Generation of 1898, with its revolutionary secular theories, provided the catalyst for a philosophical recovery whose greatest protagonists were Miguel de Unamuno, José Ortega y Gasset and Xavier Zubir. These thinkers were succeeded by the philosophers who went into exile after the Civil War of 1936-9: José Ferrater Mora, José Gaos, María Zambrano, Joaquín Xirau, and Juan David García Bacca.

1 The Middle Ages

One cannot speak of a strictly Spanish philosophy until after the founding of the Spanish State in 1474. Nevertheless, one cannot dismiss the importance of Hispano-Arabic and Hispano-Judaic philosophy prior to that date, as well as certain figures from within the Christian community who attained great prominence during Medieval times. An outstanding figure of this period was Ramón Llull, Mallorcan by birth, who developed a complicated combinatory logic - called the 'Ars Luliana' - which offered an ingenious foretaste of our current axiomatized logics. He was the author of an immense and highly diverse series of works, which sparked off a long tradition of Lullism that has continued to the present. His thought contains the seeds of the *mathesis universalis*, which served as the basis for European Rationalism as developed later by Descartes and Leibniz. The study of Llull has continued to the present day in the journal *Estudios Lulianos*, and at the Ramundus Llullus Institute in Fribourg-am-Brisgovia. Llull was the first European philosopher to write in a Romance language, since part of his work is in Catalan, although most is in Latin and some even in Arabic (see Llull, R.).

2 The Renaissance

The founding of the Spanish State brought about by the marriage of Ferdinand V of Aragon and Isabel I of Castile - the so-called Catholic Monarchs - took place during a time of crisis for Christianity, the effects of which were felt most acutely in the Catholic countries. In Spain, this was expressed initially in the widespread diffusion of the doctrines of Erasmus of Rotterdam which took on a novel and highly radical form, propounded by men as renowned as Juan and Alfonso de Valdés and Andrés Laguna. From a philosophical point of view, the single most important figure was Luis Vives who lived the greater part of his life in Bruges, although he also spent some time in Oxford after being appointed private tutor to princess Mary Tudor and reader to queen Catherine of Aragon during her marriage to Henry VIII. Vives was one of the most eminent representatives of the Renaissance spirit: his critique of Scholasticism, his rehabilitation of the classics, the attention he devoted to anthropological problems and his practical vision of philosophy were unparalleled. Perhaps his most important book is *De anima et vita (On*

the soul and on life) (1538), a precursor to differential psychology and vocational guidance, since he recognizes the need to observe and distinguish the differences in aptitude and disposition between individuals with a view to choosing their office or profession. Vives also developed an original theory of the passions very much along the modern lines which Descartes was later to pursue. All in all, Vives was a cosmopolitan and universal spirit who showed himself to have advanced beyond European thinking in his *De concordia et discordia in humano genere (On harmony and discord in humankind)* (1529), as well as in his social attitudes regarding aid and protection for the needy classes, as he revealed in *De subventione pauperum (On poor relief)* (1526). Generally speaking, Erasmianism was also a form of Europeanism which endorsed the notion of the Carlist Empire as a ‘universitas christiana’, not an ‘imperium mundi’ as it was conceived of by the pagan emperors. One important representative of this Europeanism was Andrés Laguna, doctor to king Charles V and author of *Discurso de Europa (Discourse on Europe)* (1542), in which he argued for a coalition of the Christian monarchs to form a unified force designed to counter the threat of the Ottoman Empire.

3 The Golden Age

The Spanish Renaissance, which began as a reaction to the crisis faced by European Christianity, gradually changed in character during the seventeenth century when Protestantism consolidated its advance throughout the Germanic and Anglo-Saxon countries, and also as the possibilities opened up by the discovery and colonization of America were exploited. As a result, two key philosophical fronts emerged. The first, whose common denominator was the Roman Catholic Counter-Reformation, was to give rise to the movement known as Spanish scholasticism. The greatest practitioners of this scholasticism were two religious orders, the Dominicans and the Jesuits. The main centre of activity for the Dominicans was the University of Salamanca, aided by their nearby monastery of St. Stephen, and among the main representatives were Melchor Cano, Domingo de Soto and Francisco de Vitoria. Cano’s most important work is *De Locis teologicis (On theological standpoints)* (1563), while Soto’s famous treatise is entitled *De iustitia et de iure (On justice and law)* (1553). Both helped to prepare the ground which formed the bedrock for the Council of Trent (1545-63), where the fundamentals of Catholic doctrine for the next four centuries were formulated.

As for Francisco de Vitoria, he was chiefly occupied with problems stemming from the conquest and colonization of America, concerns which he voiced in his books *De indis prior (The question of the Indies)* (1539), *De iure belli (The law of war)* (1539) and *De potestate civili (On civil power)* (1528). In these works he developed his theory of the ‘just war’, as well as that of Spain’s legal rights to the conquest and colonization of America, implementing a doctrine which would later form the basis of future international law. Here Vitoria introduced the concept of a ‘world community’ to which all people belong as a consequence of their fundamentally social nature which exists above and beyond their division into nation states. This world community was governed by natural law (*ius naturale*) and, in those matters beyond its sphere, by the law of peoples (*ius gentium*) which functioned in accordance with various principles concerning international cohabitation. According to Vitoria:

> There can be no doubt that the whole world, which is, in a certain sense, a republic, has the right to dictate just and profitable laws to all of its members, similar to those laid down in the law of peoples…. From this it follows that whoever breaks the law of peoples, whether in peacetime or in war, is committing a mortal sin, and that in matters of import, such as that concerning the immunity of ambassadors, it is forbidden for any republic to refuse to comply with the law of peoples…. Just as the majority in a republic has the right to appoint a king, so too the majority of Christians, whether or not the minority be in agreement, has the right to name a sovereign leader, who must be obeyed by all.

(Vitoria 1557: Ch. 8)

Even if they only appear in embryonic form, the rubrics of a future ‘society of nations’ are clearly and succinctly mapped out in this passage, providing an ingenious antecedent to what would only be put into practice some four centuries later, as a consequence of which Vitoria might be viewed as the founder of international law.

The impact of the discovery of America on the price of goods, and even on the value of currency, completely disrupted economic relations within the Iberian Peninsula, most severely in the city ports such as Seville. This led some theologians to speculate on the laws of supply and demand, as well as on the nature and conditions regarding the borrowing and lending of money, and eventually led them to state for the first time the ‘theoretical principles

of quantitative analysis' (Vilar 1974; Grice-Hutchison 1952). Martín de Azpilcueta and Tomás de Mercado developed their work along these lines in the sixteenth century; the former wrote the famous *Comentario resolutorio de cambios (A resolutory commentary on exchange)* (1556) while the latter was author of the equally famous *Suma de tratos y contratos (Summa of deals and contracts)* (1569).

Juan de Mairena was an outstanding Jesuit, an advocate of highly advanced social doctrines such as the common ownership of goods, and of theories such as that of regicide which he set out in *De rege et de regis institutione (On the king and his training)* (1599) - this work was banned in France, because it was thought to have played a part in the assassinations of kings Henry III and IV. Worth mentioning within the context of the Jesuits is the polemic known as 'de auxiliis' which took place between Luis de Molina and Domingo Báñez (the latter was a Dominican). This was sparked off by Molina's work *Concordia liberi arbitrii cum gratiae donis, divina praescientia, providentia, praedestinatione (The harmonious concordance of free will with the gifts of grace, divine prescience, providence and predestination)* (1588) in which he posed the question of the difficulty of reconciling divine grace and the provident omniscience of God with human liberty. Molina's doctrine availed itself of the traditional scholastic notion known as 'simultaneous concurrence', but Báñez's counter-argument in his *De vera et legitima concordia liberi arbitrii cum auxiliis gratiae Dei (On the true and legitimate concordance of free will with the aid of God's grace)* (1595) led Molina to formulate the theory of the 'middle science', the theoretical core of which were the so-called 'futuribles' (conditional futures which, despite never having occurred, can be freely determined by man and known as such by God). Báñez restricted himself to re-formulating his own theory of 'physical premonition', incorporating subtle new disquisitions such as those known as the 'science of vision' and the 'science of simple understanding'.

However, from a philosophical point of view, the most important Jesuit philosopher was Francisco Suárez, whose major works include *Disputationes metaphysicae (Debates on metaphysics)* (1597) and *De legibus ac de Deo legislatore (On laws and on God as legislator)* (1612). The first of these (although belonging to Thomist scholasticism, deviated from it significantly to the point of constituting an independent doctrine which became known as *Suarism*), takes original standpoints on issues such as the formal distinction between essence and existence, the uniqueness of the principle of individuation, and the consideration of 'real being' as the starting point for metaphysics. In his work he examined the transcendental properties of being and its grounding principles, which he then applied to the two fundamental classes of being: the infinite or uncreated (God) and the finite or created (humans). In so doing, he abandoned the medieval style of the 'commentary' and adopted instead a form of argument which proceeded according to its own intrinsic necessities, giving his work an unmistakable air of 'modernity'. This is most evident in his construction of a systematic metaphysical corpus which existed independently of Aristotelian-style scholastic commentary. It resulted in the book appearing in a host of editions as soon as it was published, and it even found its way onto the syllabus in numerous Protestant universities throughout Europe. Its influence on modern authors - Descartes, Spinoza, Leibniz, Vico - cannot be disputed.

4 Decline and the seeds of recovery

The pinnacle of Spanish Scholasticism which was reached with Suárez marked the end of a glorious epoch. The next two centuries were centuries of decline; in the seventeenth, eighteenth, and a significant portion of the nineteenth centuries, philosophical Spain lost its nerve, but a faint intellectual flame was kept alight by a few minority groups who thus saved the tradition. In the eighteenth century the *Novatores* (renovators) movement, headed by Andrés Piquer, gradually laid the foundations for a future renaissance which never materialized. A few enlightened thinkers such as B.J. Feijoo, G.M. de Jovellanos and Francisco Cabarrús helped to check the landslide, but the French invasion under Napoleon Bonaparte put an end to everything. The subsequent civil wars - the so-called 'Carlist Wars' - left an intellectual wasteland behind them. It was only in the middle of the nineteenth century that Julián Sanz del Río managed to turn the tide: his trip to Germany in 1843 and his contact with the few remaining disciples of Christian Krause in Heidelberg, allowed him to take back a few seeds of Krausist idealism to his Iberian homestead where they blossomed into a movement of spiritual and cultural renewal. This had its most important centre of diffusion at the famous Institución Libre de Enseñanza (Institute of Free Education), founded in 1876 by Francisco Giner de los Ríos and other Krausist teachers, among whom Nicolás Salmerón and Gumersindo de Azcárate were the most distinguished.

The philosophy of Giner de los Ríos was the result of the fruitful marriage of Krausist idealism and the positivism

which dominated the epoch, a strikingly original movement known in the history of Spanish philosophy as ‘Krauso-positivism’. The tangible gains of this philosophy were most apparent in the sphere of education. From the Institución Libre de Enseñanza, which was dedicated to primary and secondary education, emerged organizations such as the Junta para Ampliación de Estudios e Investigaciones Científicas (Group for the broadening of scientific studies and research) in 1907, of which Santiago Ramón y Cajal, winner of the Nobel Prize for Medicine in 1906, and José Castillejo, an eminent Romanist, were the principals. After its foundation in 1910, the Residencia de Estudiantes was run by Alberto Jiménez Fraud, whose pioneering spirit and aesthetic sensibility made it the cradle of modernism and the avant garde. Among others, Juan Ramón Jiménez, Frederico García Lorca, Rafael Alberti and Luis Buñuel studied there. Following in the wake of this great wave of renewal, mention should also be made of the foundation of the Instituto-Escuela (1918), the Residencia de Señoritas (1915) and the Misiones Pedagógicas (1931), organized and run by Manuel Bartolomé Cossío, the successor to Giner de los Ríos.

5 The Generation of 1898

The stimulus towards recovery provided by Krausism and institutionism eventually came to fruition in a powerful regenerative movement which was to bear its first great literary and philosophical fruits with the so-called Generation of 1898. From a philosophical perspective, the most eminent of this group is Miguel de Unamuno, a precursor of existentialism who made the contradiction between reason and life the crux of a philosophical conception of the world marked by anguish (*Congoja*) in the face of death. This led to his most famous work - *Del sentimiento trágico de la vida (The tragic sense of life and peoples)* (1912) - where he describes the struggle to attain personal immortality in the face of the uncertainties of reason. That struggle takes the form of an agonistic interplay between life and death in its religious version, represented by him in his book *La agon'a del cristianismo (The agony of Christianity)* (1925). As with the French existentialists, this nexus of problems was to be carried over into a literary oeuvre which consisted of a variety of novels, poetry and theatrical works (see Existentialism).

6 The School of Madrid

The secularizing philosophical theories of the Generation of 1898 broke with the philosophical tradition marked by its links with Catholicism, and this opened up the way for an important transformation of the entire discipline. Within this rebuilding process the so-called Generation of 1914 played a role of utmost importance. Most prominent here was José Ortega y Gasset who, after his education at the Neo-Kantian school of Marburg, reacted against its teachings to found a philosophy of his own. This doctrine is to be found in works such as *Meditaciones del Quijote (Meditations on Quixote)* (1914) and *El tema del nuestro tiempo (The modern theme)* (1923), among others. Ortega suggested the following maxim as the key to his philosophy: ‘ I am myself and my circumstances, and if I cannot come to terms with these, then I can never come to terms with myself’ ([1914] 1983 (1): 322).

The framework consisting of the self and its circumstances was specifically *life as radical reality*, by means of which Ortega attempted to overcome every form of rationalism. ‘Reason cannot, and need not aspire to supplant life’, he said in 1914; this approach to the matter was fully developed in *El tema de nuestro tiempo*, in which he proposed that culture be replaced by life, since it was the latter that constituted primary reality. By life Ortega here meant individual human life:

> This radical reality on the basis of the strict observation of which we must ultimately establish and secure all of our knowledge of anything, is our life, human life. Human life as radical reality is only the life of every individual, it is only my own life. For the sake of linguistic convenience I will sometimes call it ‘our life’, but it must always be understood that with this expression I am referring to the life of every individual and not to that of others nor to an assumed plural and collective life. What we call ‘other people’s lives’, the life of our friend, of the one we love, is already an added element which encroaches on the scene which is my life. By calling it ‘radical reality’ I do not mean that it is the only, nor even the highest, most respectable, sublime or supreme reality, but simply that it is the root - hence the term radical - of all of the others, in the sense that the latter, of whatever nature, must, for us to experience them as reality, somehow make themselves present or, at least, announce themselves by causing the boundaries of our own life to tremble. Therefore this radical reality - my life - is so little ego-oriented, so utterly non-solipsistic, that it is, quintessentially, the space or scene which is offered to me and opened up so that any other reality can manifest itself therein. Hence no knowledge of anything is sufficient, that is to say sufficiently profound or radical, if it does not begin by pinpointing the place

> and specifying the way, within the sphere that is our life, wherein and whereby that something appears, shows itself, bursts forth or rises up, in short, exists.
>
> (Ortega [1923] 1983 (7): 99-101)

As one of the finest commentators on Ortega's philosophy has said, what we are witnessing here is a metaphysical revolution characterized by the 'real correlation of self and world, of thought and its object, of love and what is loved: (that is) it is exactly what we call life. Living is feeling things, thinking things; it is the coexistence of self and world. Life is the primary, fundamental fact, absolutely present and evident, upon which all philosophy must base itself. Life, on a deeper and more essential plane, is the 'cogito' of the new philosophy' (García Morente 1987: 67).

This discovery of life as metaphysical reality, demanded a method through which it could be rendered accessible: the method was that of 'vital reason', which was conceived of as the same thing as living since 'reason is only a form and function of life'. What we have here is a new conception of reason that goes beyond the rationalism of 'pure reason', as an expression of modernity. According to this new formulation, reason ' is nothing more than a tiny island floating on the sea of primary vitality; far from supplanting the latter, it must depend on it for support and sustenance, just as each one of the members of the body is given life by the body as a whole' (Ortega [1923] 1983 (3): 177-8).

We are faced with a philosophical programme which implies a reversal of the tenets of traditional Western culture - as opposed to a culture which unhouses life, a culture which gains sustenance from it, injecting it with new values; as opposed to the old irony of Socrates, the irony of Don Juan, who reaffirms spontaneity, sincerity and joyousness. This was the *modern theme* which consisted in ' making reason bow before vitality, placing it within the sphere of the purely biological, subordinating it to spontaneity'; a programme which, in its philosophical essence, might be formulated thus: ' pure reason must abdicate in favour of vital reason' (Ortega [1923] 1983 (3): 178).

The vitalism so described did not imply any form of irrationalism, but constituted a new mode of understanding which Ortega named 'ratio-vitalist', within which there took shape a new theory of knowledge, essential to which was the concept of 'perspective'. Ratio-vitalism was, then, a form of perspectivism.

Ortega's philosophical theories were to attract some important philosophical figures, such as Manuel García Morente, José Gaos María de Maetzu, Xavier Zubiri, María Zambrano, Luis Recasens Siches and Lorenzo Luzuriaga who, in 1933, would give rise to what can be referred to as the School of Madrid, even if the brevity of its existence (a result of the civil war) prevented it from producing what seemed destined to be a wealth of fine philosophy.

Although he belonged in principle to the School of Madrid, Xavier Zubiri was to follow his own highly original philosophy. His starting point was one of his own theories, according to which the human is a 'reality animal' characterized by what Zubiri called 'sentient intelligence' - that is to say, a sensuous intellection and an intellectual sensing - by means of which he is able carry out his most proper function, which consists in the 'actualization of the real in so far as it is real'. This theory, which had already appeared in embryonic form in his first work, *Naturaleza, Historia, Dios (Nature, history, God)* (1944), was to be consistently developed and elaborated in his later works *Sobre la esencia (On essence)* (1962) and, above all, in his trilogy on *Sentient Intelligence* (1980).

7 Philosophy in exile

Despite the fact that the civil war (1936-9) destroyed what ought to have been the natural continuity of the School of Madrid, its members (the majority of whom went into exile) proceeded to produce a magnificent body of philosophical work in the different countries which granted them asylum. Examples include José Gaos, who formulated his own particular theory which he described as 'a philosophy of philosophy', and which has had an obvious impact on the history of Hispanic thinking; María Zambrano, who expounded and developed her method of 'poetic reasoning'; Luis Recasens Siches, who made use of Ortega's vital reason in order to produce a highly individual philosophy of law; Manuel Granell, who carried out similar work in the field of logic; José Ferrater Mora, author of a famous dictionary of philosophy, among other publications; and finally, Eduardo Nicol, an

original and independent thinker who developed a meditation on the nature and future of philosophy.

Probably the most original thinker of all of those exiled from Spain was Juan David García Bacca, author of a multifaceted and highly varied oeuvre which revolved principally around a metaphysical meditation on the artificial world created by man, while within the sphere of Marxist socialism and related fields particularly significant is Fernando de los Ríos who later went on to write more historical studies, although his leanings were always towards social and political philosophy. His *Mi Viaje a la Rusia Soviética (My journey to Soviet Russia)* (1921) was decisive in keeping the Spanish Socialist Party away from the Third International. Within the tradition of more rigorously orthodox Marxist thought, mention should be made of the then young thinker Adolfo Sánchez Vásquez whose philosophical reflections have been directed at its more practical aspects, especially those relating to art and aesthetics, although his most important work continues to be *Filosof'a de la praxis (The philosophy of praxis)* (1967).

8 Independent thinkers

From the end of the nineteenth and during the first half of the twentieth century, a number of independent figures - difficult to categorize in terms of any one school or movement - appeared in Spain. The most striking of these was Jorge Ruiz de Santayana, better known as George Santayana, the name with which he signed his writings, since they all appeared in English in the USA, where he was professor at Harvard. After 1912 he lived in various European countries - England, Spain, Italy - before finally settling down in Rome where he remained until his death in 1952. He was the author of a highly diverse body of work, without doubt the most important of which was *The Realms of Being* (1942). His philosophy is best categorized as a form of sceptical materialism marked by a heightened aesthetic sensibility. Although an atheist, he placed a great deal of importance on religion from a symbolic point of view (in fact he lived and died in a monastery) which has led people to speak of an aesthetic naturalism.

A second independent thinker was the priest Angel Amor Ruibal, author of the dense and colossal work *Los problemas fundamentales de la filosof'a y el dogma (The fundamental problems of philosophy and dogma)* most of which remained unedited during the author’s lifetime, but which has been gradually published since his death in 1930. It has now been shown that these writings contain an original philosophical system which might be termed correlationism or transcendental relativism, since it is not a pure and simple relativism, but rather a universal atomism in which the value of the individual is retained. It sees the universe as being composed of a series of interrelated fundamental systems, in which beings constitute ‘links’ which subordinate one another until they interconnect - like a vertically structured chain running from the lowest being to the highest - in a continuous universal interaction which is monistic in nature, since the parts acquire meaning only through their relation to the whole.

A third thinker of importance is Eugenio d’Ors who, at the start of his career, was noted for his close links with the Catalonian Government and in his later years for those he established with General Franco’s dictatorship, but who led a solitary existence during the greater part of his life. Within his varied output he developed a sort of ‘figurative thinking’ upon which he constructed certain ‘figures of intelligence’, the object of which was to arrive at a ‘harmonious reason’, which he located precisely half way between life and pure reason. This in turn provides the basis for what he called a ‘Keplerian reform of philosophy’, in which the principle of contradiction was replaced by the principle of participation, and that of sufficient reason by that of required function. All of this gave rise to an understanding of the universe as a syntactical structure.

9 From dictatorship to democracy

Franco’s victory in the civil war of 1936-9 determined the subsequent course taken by philosophy in Spain. First, it forced the majority of thinkers and teachers of philosophy into exile; second, it imposed on secondary and university education a sort of ‘official philosophy’, the basis of which was the most antiquated scholasticism. It should be stressed, however, that the later peaceful transition from the dictatorship period to democracy owed much to those philosophers who managed to retain an independent sense of judgment, by adhering to their liberal principles as far as the regime would allow. Among these is José Luis Aranguren who, starting out from a Roman Catholic standpoint, allowed his thinking to open out onto increasingly broad perspectives, incorporating the latest ideas to emerge from existentialism, from Anglo-Saxon thought and from the dialectical strains of Marxism.

Another is Pedro Laín Entralgo, who was deeply involved in work as a historian of medicine, which gradually opened up the way for him to formulate a philosophy of hope and a medical anthropology in which the reality of the ‘other’ is always present. Also of importance is Enrique Tierno Galván, a committed socialist who played an active role in politics - he became Mayor of Madrid - which did not prevent him from producing an important body of philosophical work, to which his book *Razón mecánica y razón dialéctica (Mechanical reason and dialectical reason)* (1969) is testimony.

Among those who kept the sacred torch of Ortega’s philosophy burning in Spain are Paulino Garagorri, an important exegete and compiler of Ortega’s work, and Julián Marías, perhaps the most faithful disciple of the master whose philosophy he has systematized in his magnum opus *Ortega* (1962, 1983). It was this group of thinkers who made it possible for the first sparks of rebellion against Franco’s regime to flare up in 1956.

Species

The diversity of life is not seamless but comes in relatively discrete packages, species. Is that packaging real, or an artefact of our limited temporal perspective on the history of life? If all living forms are descended from one or a few ancestors, there may be no real distinction between living and ancestral forms, or between closely related living animals.

Received wisdom holds that species are the 'units of evolution', for it is they that evolve. They are the upshot *of evolutionary processes, but, if species and not just their component organisms compete with one another, they are also important* agents *in the evolutionary process. If so, species are real units in nature, not arbitrary segmentations of seamless variation.*

The 'species problem' has been approached from two angles. One focus has been on specific taxa of the tree of life. What would settle whether some arbitrarily chosen organism is a member of homo sapiens *or* canis familiaris*? This is sometimes known as the 'species taxon' problem. An alternate way of approaching diversity has been to ask what all species have in common. What do all the populations we think of as species share? This is the 'species category' problem.*

One idea is to group organisms into species by appealing to the overall similarity. This 'phenetic' conception is in retreat. Most contemporary species definitions are relational, the animals that compose pan troglodytes *are a species, not because they are all very similar (they are very like the pygmy chimps as well) but because of their relations amongst themselves and with their ancestors. The most famous relational definition is the 'biological species concept', according to which conspecific organisms are organisms that can interbreed, however different they look.*

Relational species definitions aim to define a category of theoretical and explanatory interest to evolutionary and ecological theory. Given that there are many explanatory interests, one problem in evaluating these accounts is to determine whether they are genuinely rivals.

1 Species as historical entities

There have been three main views of the species category. So-called 'phenetic' species concepts define species membership and difference by appeal to some measure of overall morphological, genetic or behavioural similarity. This view has slid from favour. First, there are many measures of similarity at any one time. These give different results and choice between them is arbitrary. Second, the similarity conception of species entails that the segmentation of the tree of life is arbitrary. As the population gradually changes there are many ways of dividing up the twig, many different similarity groupings, on the tree of life leading to us. The distinction between *homo sapiens* and *homo erectus* emerges as nothing but a curator's convenience. Third, the collections of organisms so recognized would be of no particular evolutionary significance. If species are just collections of similar organisms, measured by one of the many different similarity measures, the species category is not a natural kind.

The alternatives accept some version of the Ghiselin (1974) and Hull (1978) proposal that particular species are defined by their histories. 'Platypus' names a segment of the tree of life. Species come into existence, change, and go extinct. Whereas any appropriately latticed arrangement of carbon atoms is a diamond, a *rattus rattus* lookalike produced through convergent evolution near Alpha Centauri is not a member of the rat species. But to say that species are historical kinds is one thing, to say what historical kinds, another. Why do we regard *canis familiaris* as a single species rather than as a group of sister species? What do we need to find out to determine whether the Neanderthals were a separate species of *homo*, or a mere subspecies of *homo sapiens*?

The biological species concept offers one answer to this question: a species is a population of actually or potentially interbreeding organisms. Coexisting with the biological species concept are a plethora of *phylogenetic species concepts*. These all identify species with segments of lineages of ancestral/descendent populations. Species are segments of a phylogenetic tree. Which segments? Proponents of phylogenetic definitions differ in their proposals for specifying the depth of the lineage in time, and its cross-section at a time.

One of our problems is to determine the extent to which the biological species concept genuinely competes with

the variants of the phylogenetic concept. I, like many, think the phylogenetic and biological species concepts divide the labour between them. Species are chunks of the genealogical nexus between speciation events. The biological species concept gives us an account of speciation events, that is, the process through which a single ancestral species becomes two or more descendent species.

2 The biological species concept

The biological species concept takes the reproductive community to be central to the role of species as evolutionary units. Adaptation and speciation require some isolating mechanism so that an incipient species, a small population in a new selective regime, can preserve in its gene pool the evolutionary innovations that develop within it. An unprotected gene pool will be diluted by migration. The special genetic information will disappear if there is substantial flow between it and the parent population. There can be no special suite of adaptations without some form of isolation; no protection of that suite of adaptations without entrenching that isolation which erects permanent barriers between old and descendant populations. The biological species concept identifies a category of populations - reproductively isolated populations - that can evolve distinctive adaptations.

This proposal faces problems important enough to show that the biological species concept is at best an incomplete account of the nature of species.

First, the notion of a reproductively isolated community is an idealisation, and we can legitimately choose different idealisations. We have to bear in mind two problems. Lineages can be genuinely separate despite some gene flow. There are occasional ‘freak’ crossings. Major Mitchell cockatoos occasionally hybridise with galahs, but these two lineages are distinct. Lineage-crossing is common amongst plants, amongst whom gene flow across species boundaries is common. There are more problematic cases. As a consequence of human modification of river ecologies in New Zealand, black stilts now hybridise with pied stilts sufficiently often to threaten the survival of the black stilt lineage - if it is a lineage. But we are faced not just with freak crossings but pseudo-division. Groups which merely happen to breed only amongst themselves do not constitute a new lineage. Royal families are members of *homo sapiens* however unsullied their blood lines. So the reproductive criterion yields no unique segmentation of organisms into species. The notion of ’potentially interbreeding’ neither is nor can be made fully precise (Kitcher 1989; O’Hara 1993). There is no unique count of protected genetic pools. Gene flow really does come in degrees.

Second, the limitation of gene flow is just one factor that make a lineage ’cohesive’. A buffered gene pool is not all that matters in explaining the distinctness and common fate of a group of populations. Both phylogeny, shared environment, and exposure to a common selective regime must equally be part of the cohesiveness of a species. Ehrlich and Raven (1969) show that in many species gene flow is very limited between local populations (’demes’). So we can have cohesiveness with little flow.

A third problem concerns time. The biological species concept seems to give no good way of segmenting a lineage over time that recognizes that the *Erectus/Sapiens* distinction is a real division in a continuous lineage. It gives no good way of deciding whether organisms living at different times are members of the same species. Perhaps we might suppose that an organism ceases to be conspecific with a member of a later generation if it would not recognize that changed organism as a potential mate. But then, in a gradually evolving lineage the segmentation into species would depend on the choice of baseline. The biological species concept needs supplementation. The interbreeding criterion should not be applied to organisms at different times. If Abe and Adolf are members of different generations they are in the same species, if Adolf has descended from organisms conspecific with Abe by the interbreeding criterion and no speciation event has intervened in the genealogical tree.

Finally, the biological species concept is mute in the face of obligatorily asexual organisms. These are not so rare or unimportant that they can be fudged away as a minor exception.

3 Phylogenetic species concepts

The basic idea of phylogenetic species concepts is to identify a species with a segment of a phylogenetic tree between two speciation events, or between speciation and extinction. Two organisms are members of the same species if they are part of the same lineage, and no speciation event has separated them. On this view, two conspecific organisms could be morphologically very different from one another, so long as the lineage of which

they are part has not split in the course of its evolutionary transformation. Phylogenetic species definitions therefore owe us an account of speciation, extinction, and a method for counting lineages. Granted satisfactory solutions to these problems, phylogenetic accounts have clear attractions. They may apply to both sexual and asexual species. If a suitable way of individuating lineages can be developed, a phylogenetic account might be noncommittal on the causes of ‘cohesion’. There is some advantage to that if in different lineages, gene flow, stabilising selection and phylogenetic inertia have different weights in establishing cohesion. The idea is that the phylogenetic species concept is founded in the objective branching *pattern* of nature rather than in a theory of evolutionary *process*. Humans are not conspecific with protists even though we descend from them because there exist punctuations of the tree in which lineages split into descendent lineages.

But it is not clear that this potential advantage is actual. Consider a minor evolutionary pattern: the fissuring or pseudo-fissuring of the lineage of the Australian brushtail possum into many Australian populations and assorted populations in the New Zealand archipelago. Which of these populations are new species? The phylogenetic species concept - in some incarnations - gives the crazy result that most are. Some proposals for counting lineages rely on the idea of a population having a separate historical fate or entering a new adaptive zone (Van Valen 1976; Wiley 1978). If that were right, the New Zealand possum population would be a separate species, as their adaptive zone and fate is distinct from the Australian population. So would be tiny populations that persisted for a few generations on small islands or isolated fragments of bushland. Phylogenetic identification of independent lineages seem to either count too finely, be excessively vague, or to tacitly depend on the biological species concept, and thus to inherit its problems with asexual species.

So the most obvious way of delimiting chunks of a tree is through appeal to reproductive isolation. Yet this ignores asexual species. Even if asexuality were rare, the problem would be serious. Reproductive isolation is alleged to be constitutive of being a species, not merely a good symptom of it (Kitcher 1989). A heroic solution would be to deny that asexual organisms are in species. This is heroic, for we would then have to explain just why ’pseudo-populations’ of, for example, some whiptail lizards seem to be species. Moreover, and more seriously the distinction between asexuality and sexuality is not sharp. Rather, asexuality is the endpoint of a continuum of degrees of gene flow whose other point is the promiscuity of plant hybridisation (Templeton 1989).

An ideal response would be to find a genuine equivalent in asexual organisms of reproductive isolation amongst sexual ones. We could try to find string to bundle the clones together, and an equivalent of the attainment of isolation to underwrite the segmentation of the bundles into two. Some version of Templeton’s ’cohesion’ species concept may do the job: Templeton argues that in most species ’cohesion’ - the clumping in the space of possible organisms which allows us to recognize species in the first place - is produced by ecology and selection, not just gene flow. Asexual species might be cohesive just in virtue of these other forces, though it remains unclear what the asexual equivalent of speciation would be.

Kitcher (1989) urges on us a more radical moral: multiply species concepts. He thinks it plain that asexual organisms clump into species. The phenetic concept of morphological distinctness is *constitutive* of the species category for asexual organisms. Why then not say that it is constitutive of at least *a species category* for sexual organisms? If Kitcher is right about asexual organisms, the same conclusion is not forced elsewhere. In both sexual and asexual lineages, clumped diversity is a residue of a historical process. But with sexual species that historical process is one in which gene exchange and a protected gene pool played a central role. That process is important enough to mark by regarding sexual organisms as clumped into species in a different sense than are asexual organisms. It is not at all obvious that a group of similar asexual clones form an evolutionary unit; the sexually reproducing population does.

We might have good reasons to consider organisms grouped by their intrinsic similarities of morphology, physiology or behaviour. It is perfectly appropriate to formulate hypotheses about the molecular mechanisms of, say, the retroviruses whether or not they all spring from the same stock, a hypothesis about the mechanism of reverse transcription could still be true and their distinctive adaptation might have a single molecular basis. Not all biology is historical biology. Even so, the validity of physiological groups in functional biology does not show that there is a notion of species defined by appeal to a shared physiology.

What emerges from all this? The most plausible account of species seems to be an evolutionary account: species are lineages between speciation events. The biological species concept re-emerges as an account of the process by

which a lineage divides into two. Lineages split when their components become reproductive isolated, one from another. Lineages converge when two formerly isolated lineages become a reproductive community through, for example, hybridisation. Two central problems remain to be solved. First, the inherent roughness of the notion of reproductive isolation means that the identification of species is in principle, not just in practice less sharp than some have claimed. Second, the status of asexuality remains problematic.

Speech acts

Making a statement may be the paradigmatic use of language, but there are all sorts of other things we can do with words. We can make requests, ask questions, give orders, make promises, give thanks, offer apologies and so on. Moreover, almost any speech act is really the performance of several acts at once, distinguished by different aspects of the speaker's intention; there is the act of saying something, what one does in saying it, such as requesting or promising, and how one is trying to affect one's audience.

The theory of speech acts is partly taxonomic and partly explanatory. It must systematically classify types of speech acts and the ways in which they can succeed or fail. It must reckon with the fact that the relationship between the words being used and the force of their utterance is often oblique. For example, the sentence 'This is a pig sty' might be used nonliterally to state that a certain room is messy, and further to demand indirectly that it be tidied up. Even when this sentence is used literally and directly, say to describe a certain area of a farmyard, the content of its utterance is not fully determined by its linguistic meaning - in particular, the meaning of the word 'this' does not determine which area is being referred to. A major task for the theory of speech acts is to account for how speakers can succeed in what they do despite the various ways in which linguistic meaning underdetermines use.

In general, speech acts are acts of communication. To communicate is to express a certain attitude, and the type of speech act being performed corresponds to the type of attitude being expressed. For example, a statement expresses a belief, a request expresses a desire, and an apology expresses a regret. As an act of communication, a speech act succeeds if the audience identifies, in accordance with the speaker's intention, the attitude being expressed.

Some speech acts, however, are not primarily acts of communication and have the function not of communicating but of affecting institutional states of affairs. They can do so in either of two ways. Some officially judge something to be the case, and others actually make something the case. Those of the first kind include judges' rulings, referees' decisions and assessors' appraisals, and the latter include sentencing, bequeathing and appointing. Acts of both kinds can be performed only in certain ways under certain circumstances by those in certain institutional or social positions.

1 Levels of speech acts

How language represents the world has long been, and still is, a major concern of philosophers of language. Many thinkers, such as Leibniz, Frege, Russell, the early Wittgenstein and Carnap, have thought that understanding the structure of language could illuminate the nature of reality. However noble their concerns, such philosophers have implicitly assumed, as J.L. AUSTIN complains at the beginning of *How to Do Things with Words* (1962), that 'the business of a (sentence) can only be to "describe" some state of affairs, or to "state some fact", which it must do either truly or falsely'. Austin reminds us that we perform all sorts of 'speech acts' besides making statements, and that there are other ways for them to go wrong or be 'infelicitous' besides not being true. The later Wittgenstein also came to think of language not primarily as a system of representation but as a vehicle for all sorts of social activity. 'Don't ask for the meaning', he admonished, 'ask for the use'. But it was Austin who presented the first systematic account of the use of language. And whereas Wittgenstein could be charged with conflating meaning and use, Austin was careful to separate the two. He distinguished the meaning (and reference) of the words used from the speech acts performed by the speaker using them.

Austin's attention was first attracted to what he called 'explicit performative utterances', in which one uses sentences like 'I nominate', 'You're fired', 'The meeting is adjourned' and 'You are hereby sentenced… ' to perform acts of the very sort named by the verb, such as nominating, firing, adjourning, or sentencing (see Performatives). Austin held that performatives are neither true nor false, unlike what he called 'constatives'. However, he came to realize that constatives work just like performatives. Just as a suggestion or an apology can be made by uttering 'I suggest… ' or 'I apologize… ', so an assertion or a prediction can be made by uttering 'I assert… ' or 'I predict… '. Accordingly, the distinction between constative and performative utterances is, in Austin's general theory of speech acts, superseded by that between saying something and what one does in saying it. This broader distinction applies to both statements and other sorts of speech acts, and takes into account the fact

that one does not have to say 'I suggest… ' to make a suggestion, 'I apologize… ' to make an apology, or 'I assert… ' to make an assertion.

The theory of speech acts aims to do justice to the fact that even though words (phrases, sentences) encode information, people do more things with words than convey information, and that when people do convey information, they often convey more than their words encode. Although the focus of speech act theory has been on utterances, especially those made in conversational and other face-to-face situations, the phrase 'speech act' should be taken as a generic term for any sort of language use, oral or otherwise. Speech acts, whatever the medium of their performance, fall under the broad category of intentional action, with which they share certain general features (see Action; INTENTION §5). An especially pertinent feature is that when one acts intentionally, generally one has a set of nested intentions. For instance, having arrived home without one's keys, one might push a button with the intention not just of pushing the button but of ringing a bell, rousing one's spouse and, ultimately, getting into one's house. The single bodily movement involved in pushing the button comprises a multiplicity of actions, each corresponding to a different one of the nested intentions. Similarly, speech acts are not just acts of producing certain sounds.

Austin identifies three distinct levels of action beyond the act of utterance itself. He distinguished the act *of* saying something, what one does *in* saying it, and what one does *by* saying it, and dubs these the 'locutionary', the 'illocutionary' and the 'perlocutionary' act, respectively. Suppose, for example, that a bartender utters the words, 'The bar will be closed in five minutes.' He is thereby performing the locutionary act of saying that the bar (that is, the one he is tending) will be closed in five minutes (from the time of utterance). Notice that what the bartender is saying, the content of his locutionary act, is not fully determined by the words he is using, for they do not specify the bar in question or the time of the utterance. In saying this, the bartender is performing the illocutionary act of informing the patrons of the bar's imminent closing and perhaps also the act of urging them to order a last drink. Whereas the upshot of these illocutionary acts is understanding on the part of the audience, perlocutionary acts are performed with the intention of producing a further effect. The bartender intends to be performing the perlocutionary acts of causing the patrons to believe that the bar is about to close and of getting them to order one last drink. He is performing all these speech acts, at all three levels, just by uttering certain words.

There seems to be a straightforward relationship in this example between the words uttered ('The bar will be closed in five minutes'), what is thereby said, and the act of informing the patrons that the bar will close in five minutes. Less direct is the connection between the utterance and the act of urging the patrons to order one last drink. Clearly there is no linguistic connection here, for the words make no mention of drinks or of ordering. This indirect connection is inferential. The patrons must infer that the bartender intends to be urging them to leave and, indeed, it seems that the reason his utterance counts as an act of that sort is that he is speaking with this intention. There is a similarly indirect connection when an utterance of 'It's getting cold in here' is made not merely as a statement about the temperature but as a request to close the window or as a proposal to go somewhere warmer. Whether it is intended (and is taken) as a request or as a proposal depends on contextual information that the speaker relies on the audience to rely on. This is true even when the connection between word and deed is more direct than in the above example, for the form of the sentence uttered may fail to determine just which sort of illocutionary act is being performed. Consider, by analogy, the fact that in shaking hands we can, depending on the circumstances, do any one of several different things: introduce ourselves, greet each other, seal a deal, or bid farewell. Similarly, a given sentence can be used in a variety of ways, so that, for example, 'I will call a lawyer' could be used as a prediction, a promise, or a warning. How one intends it determines the sort of act it is.

2 Communicative and conventional speech acts

The examples considered thus far suggest that performing a speech act, in particular an illocutionary act, is a matter of having a certain communicative intention in uttering certain words. Such an act succeeds, and the intention with which it is performed is fulfilled, if the audience recognizes that intention. Not by magic, of course - one must choose one's words in such a way that their utterance makes one's intention recognizable under the circumstances. However, as illustrated above, the utterance need not encode one's intention. So, in general, understanding an utterance is not merely a matter of decoding it.

A specifically communicative intention is a reflexive intention, of the sort characterized by H.P. Grice (1989) (see Communication and intention). This is an intention part of whose content is that it be recognized, indeed be

recognized partly on the basis that this is intended. Accordingly, it is an intention whose fulfilment consists in its recognition. This feature distinguishes acts of communication from most sorts of acts, whose success does not depend on anyone's recognizing the intention with which they are performed. One cannot succeed in running a marathon just by virtue of someone's recognizing one's intention to do so, but one can succeed in stating something, requesting something, and so on, by virtue of one's addressee recognizing that one is stating it, requesting it, or whatever. This is success at the illocutionary level. It is a further matter, a condition on the success of the perlocutionary act, whether the addressee believes what one states or does what one requests.

Now Austin did not take into account the central role of speakers' intentions and hearers' inferences. He supposed that the successful performance of an illocutionary act is a matter of convention, not intention. Indeed, he held that the use of a sentence with a certain illocutionary force is conventional in the peculiar sense that this force can be 'made explicit by the performative formula'. P.F. Strawson (1964) argues that in making this claim Austin was overly impressed by the special case of utterances that affect institutional states of affairs, and should have not taken them as a model of illocutionary acts in general. Austin was especially struck by the character of explicit performative utterances, in which one uses a verb that names the very type of act one is performing. For them he developed an account of what it takes for such acts to be performed successfully and felicitously, classifying the various things that can go wrong as 'flaws', 'hitches' and other sorts of 'infelicities'. It is only in certain conventionally designated circumstances and by people in certain positions that certain utterances can have the force they do. For example, only in certain circumstances does a jury foreman's pronouncement of 'Guilty' or 'Not guilty' count as a verdict, a legislator's 'Aye' or 'Nay' as a vote, and a baseball umpire's cry of 'Y'er out' as calling a runner out. In these cases it is only by conforming to a convention that an utterance of a certain form counts as the performance of an act of a certain sort. However, as Strawson argues, most illocutionary acts succeed not by conformity to convention but by recognition of intention. They are not conventional except in the irrelevant sense that the words and sentences being used have their linguistic meanings by virtue of convention (see Language, conventionality of).

Strawson's argument raises a serious problem for theories inspired by Austin's view. Consider, for example, the theory advanced by John Searle (1969), who proposes to explain illocutionary forces by means of 'constitutive rules' (conventions) for using 'force-indicating' devices, such as performative verbs and sentential moods. The problem is that the same sorts of illocutionary acts that can be performed by means of such devices can be performed without them. For example, one does not have to use a performative, as in 'I demand that you be quiet', or the imperative mood, as in 'Be quiet!', to demand that someone be quiet. Clearly a theory that relies on rules for using such devices is not equipped to explain the illocutionary forces of utterances lacking such devices. No such difficulty arises for a theory according to which most illocutionary acts are performed not with an intention to conform to a convention but with a communicative intention.

3 Types of speech acts

Pre-theoretically, we think of an act of communication, linguistic or otherwise, as an act of expressing oneself. This rather vague idea can be made more precise if we get more specific about what is being expressed. Take the case of an apology. If you utter '(I'm) sorry I didn't call back' and intend this as an apology, you are expressing regret for not returning a phone call. An apology just *is* the act of (verbally) expressing regret for, and thereby acknowledging, something one did that might have harmed the hearer. An apology is communicative because it is intended to be taken as expressing a certain attitude, in this case regret. It succeeds as such if it is so taken. In general, an act of communication succeeds if it is taken as intended. That is, it must be understood or, in Austin's words, 'produce uptake'. With an apology, this is a matter of the addressee recognizing the speaker's intention to be expressing regret for some deed or omission. Using a special device such as the performative 'I apologize' may of course facilitate understanding (understanding is correlative with communicating), but in general this is unnecessary. Communicative success is achieved if the speaker chooses their words in such a way that the hearer will, under the circumstances of utterance, recognize their communicative intention. So, for example, if you spill some beer on someone and say 'Oops' in the right way, your utterance will be taken as an apology.

In saying something one generally intends more than just to communicate - getting oneself understood is intended to produce some effect on the listener. However, our speech act vocabulary can obscure this fact. When one apologizes, for example, one may intend not merely to express regret but also to seek forgiveness. Seeking

forgiveness is, strictly speaking, distinct from apologizing, even though one utterance is the performance of an act of both types. As an apology, the utterance succeeds if taken as expressing regret for the deed in question: as an act of seeking forgiveness, it succeeds if forgiveness is thereby obtained. Speech acts, being perlocutionary as well as illocutionary, generally have some ulterior purpose, but they are distinguished primarily by their illocutionary type, such as asserting, requesting, promising and apologizing, which in turn is distinguished by the type of attitude expressed. The perlocutionary act is a matter of trying to get the hearer to form some correlative attitude and in some cases to act in a certain way. For example, a statement expresses a belief and normally has the further purpose of getting the addressee to form the same belief. A request expresses a desire for the addressee to do a certain thing and normally aims for the addressee to intend to and, indeed, actually do that thing. A promise expresses the speaker's firm intention to do something, together with the belief that by their utterance they are obliged to do it, and normally aims further for the addressee to expect, and to feel entitled to expect, them to do it.

Statements, requests, promises and apologies are examples of the four major categories of communicative illocutionary acts: *constatives*, *directives*, *commissives* and *acknowledgements*. This is the nomenclature used by Bach and Harnish (1979) who develop a detailed taxonomy in which each type of illocutionary act is individuated by the type of attitude expressed (in some cases there are constraints on the content as well). There is no generally accepted terminology here, and Bach and Harnish borrow the terms 'constative' and 'commissive' from Austin and 'directive' from Searle. They adopt the term 'acknowledgement', over Austin's 'behabitive' and Searle's 'expressive', for apologies, greetings, congratulations, and so on, which express an attitude regarding the hearer occasioned by some event that is thereby being acknowledged, often in satisfaction of a social expectation. Here are assorted examples of each type:

Constatives. Affirming, alleging, announcing, answering, attributing, claiming, classifying, concurring, confirming, conjecturing, denying, disagreeing, disclosing, disputing, identifying, informing, insisting, predicting, ranking, reporting, stating, stipulating.
Directives. Advising, admonishing, asking, begging, dismissing, excusing, forbidding, instructing, ordering, permitting, requesting, requiring, suggesting, urging, warning.
Commissives. Agreeing, guaranteeing, inviting, offering, promising, swearing, volunteering.
Acknowledgements. Apologizing, condoling, congratulating, greeting, thanking, accepting (acknowledging an acknowledgement).

Bach and Harnish spell out the correlation between type of illocutionary act and type of expressed attitude. In many cases, such as answering, disputing, excusing and agreeing, as well as all types of acknowledgement, the act and the attitude it expresses presuppose a specific conversational or other social circumstance.

For types of acts that are distinguished by the type of attitude expressed, there is no need to invoke the notion of convention to explain how it can succeed. The act can succeed if the hearer recognizes the attitude being expressed, such as a belief in the case of a statement and a desire in the case of a request. Any further effect it has on the hearer, such as being believed or being complied with, or just being taken as sincere, is not essential to its being a statement or a request. Thus an utterance can succeed as an act of communication even if the speaker does not possess the attitude they are expressing: communication is one thing, sincerity another. Communicating is as it were just putting an attitude on the table; sincerity is actually possessing the attitude one is expressing. Correlatively, the hearer can understand the utterance without regarding it as sincere - for example, take it as an apology, as expressing regret for something, without believing that the speaker regrets having done the deed in question. Getting one's audience to believe that one actually possesses the attitude one is expressing is not an illocutionary but a perlocutionary act.

4 Direct, indirect and nonliteral speech acts

As Austin observed, the content of a locutionary act (what is said) is not always determined by what is meant by the sentence being uttered. Ambiguous words or phrases need to be disambiguated (see Ambiguity) and the references of indexical and other context-sensitive expressions need to be fixed in order for what is said to be determined fully (see Demonstratives and Indexicals). Moreover, what is said does not determine the illocutionary act(s) being performed. We can perform a speech act (1) directly or indirectly, by way of performing another

speech act, (2) literally or nonliterally, depending on how we are using our words, and (3) explicitly or inexplicitly, depending on whether we fully spell out what we mean.

These three contrasts are distinct and should not be confused. The first two concern the relation between the utterance and the speech act(s) thereby performed. In indirection a single utterance is the performance of one illocutionary act by way of performing another. For example, we can make a request or give permission by way of making a statement, say by uttering 'I am getting thirsty' or 'It doesn't matter to me', and we can make a statement or give an order by way of asking a question, such as 'Will the sun rise tomorrow?' or 'Can you clean up your room?' When an illocutionary act is performed indirectly, it is performed by way of performing some other one directly. In the case of nonliteral utterances, we do not mean what our words mean but something else instead. With nonliterality the illocutionary act we are performing is not the one that would be predicted just from the meanings of the words being used, as with likely utterances of 'My mind got derailed' or 'You can stick that in your ear'. Occasionally utterances are both nonliteral and indirect. For example, you might utter 'I love the sound of your voice' to tell someone nonliterally (ironically) that you cannot stand the sound of their voice and thereby indirectly to ask them to stop singing.

Nonliterality and indirection are the two main ways in which the semantic content of a sentence can fail to determine the full force and content of the illocutionary act being performed in using the sentence. They rely on the same sorts of processes that Grice discovered in connection with what he called 'conversational implicature' (see Implicature), which, as is clear from Grice's examples, is nothing more than the special case of nonliteral or indirect constatives made with the use of indicative sentences. A few of Grice's examples illustrate nonliterality, such as 'He was a little intoxicated', used to explain why a man smashed some furniture, but most of them are indirect statements, such as 'There is a garage around the corner', used to tell someone where to get petrol, and 'Mr X's command of English is excellent, and his attendance has been regular', giving the high points in a letter of recommendation. These are all examples in which what is meant is not determined by what is said. However, Grice overlooks a different kind of case, marked by contrast (3) listed above.

There are many sentences whose standard uses are not strictly determined by their meanings but are not implicatures or figurative uses either. For example, if one's spouse says 'I will be home later', they are likely to mean that they will be home later that night, not merely some time in the future. In such cases what one means is an *expansion* of what one says, in that adding more words ('tonight', in the example) would have made what was meant fully explicit. In other cases, such as 'Jack is ready' and 'Jill is late', the sentence does not express a complete proposition. There must be something which Jack is being claimed to be ready for and something which Jill is being claimed to be late for. In these cases what one means is a *completion* of what one says. In neither sort of case is a particular word or phrase being used nonliterally and there is no indirection. They both exemplify what may be called 'impliciture', since part of what is meant is communicated not explicitly but implicitly, by way of expansion or completion.

5 Philosophical importance of speech act theory

The theory of speech acts has applications to philosophy in general, but these can only be illustrated here. In ethics, for example, it has been supposed that sentences containing words like 'good' and 'right' are used not to describe but to commend, hence that such sentences are not used to make statements and that questions of value and morals are not matters of fact. This line of argument is fallacious. Sentences used for ethical evaluation, such as 'Loyalty is good' and 'Abortion is wrong', are no different in form from other indicative sentences. Whatever the status of their contents, they are standardly used to make statements. This leaves open the possibility that there is something fundamentally problematic about their contents. Perhaps such statements are factually defective and, despite syntactic appearances, are neither true nor false. However, this is a metaphysical issue about the status of the properties to which ethical predicates purport to refer. It is not the business of the philosophy of language to determine whether or not there are such properties as goodness or rightness and whether or not the goodness of loyalty and the rightness of abortion are matters of fact. The above argument is but one illustration of what Searle calls the 'speech act fallacy'. He also identifies examples of the 'assertion fallacy', whereby conditions of making an assertion are confused with what is asserted. For example, one might fallaciously argue, on the grounds that because one would not assert that one believes something if one was prepared to assert that one knows it, that knowing does not entail believing. Grice identifies the same fallacy in a parallel argument, according to which

seeming to have a certain feature entails not actually having that feature (see Ordinary language philosophy).

For philosophy of language in particular, the theory of speech acts underscores the importance of the distinction between language use and linguistic meaning (see Pragmatics; Semantics). This distinction sharpens the formulation of questions about the nature of linguistic knowledge, by separating questions about capacities exercised in linguistic interaction from those specific to knowledge of language itself. A parallel distinction, between speaker reference and linguistic reference (see Reference), provokes the question of to what extent linguistic expressions refer independently of speakers' use of them to refer. It is common, for example, for philosophers to describe expressions like 'the car', 'Robert Jones' and 'they' as having different references in different contexts, but it is arguable that this is merely a misleading way of saying that speakers use such expressions to refer to different things in different contexts.

Spencer, Herbert (1820-1903)

Herbert Spencer is chiefly remembered for his classical liberalism and his evolutionary theory. His fame was considerable during the mid- to late-nineteenth century, especially in the USA, which he visited in 1882 to be lionized by New York society as the prophetic philosopher of capitalism. In Britain, however, Spencer's reputation suffered two fatal blows towards the end of his life. First, collectivist legislation was introduced to protect citizens from the ravages of the industrial revolution, andSpencer's spirited defence of economic laissez-faire *became discredited. Second, his evolutionary theory, which was based largely on the Lamarckian principle of the inheritance of organic modifications produced by use and disuse, was superseded by Darwin's theory of natural selection. Nearly a century after his death, however, there is renewed interest in his ideas, partly because the world has become more sympathetic to market philosophies, and partly because the application of evolutionary principles to human society has become fashionable once more.*

Spencer was born into a Nonconformist family in Derby, England, and never lost the individualistic temperament conferred by his upbringing. Trained as a civil engineer working for a railway company during the boom years of railway expansion, Spencer's fertile mind soon spread to social and economic issues, and he joined the *Economist* as a sub-editor in 1848. In 1851 the publication of his first book, *Social Statics*, established his reputation as a thinker of extraordinary power and originality. In it he deduced the features of a civilized society from the central principle of justice - the law of equal freedom - that 'every person has freedom to do all that he wills, provided he infringes not the equal freedom of any other man' (1851: 103). This principle of equal freedom, which has been regarded ever since as the cornerstone of classical liberalism, led Spencer to insist on a very narrow role for the state (see Liberalism; State, the §§1-2). The state was at best a necessary evil to prevent one person from violating the rights of another - that is, to defend natural rights. *Social Statics* is the definitive text of the minimal or 'nightwatchman' theory of the state.

Spencer subsequently embarked upon an ambitious task of creating a wholly new understanding of philosophy, at the heart of which was the theory of evolution. In *Social Statics* an idea of the evolutionary progress of humanity had been implicitly assumed but not developed.Spencer explicitly applied evolutionary theory in his essay 'The Development Hypothesis' ([1890] 1852). He rejected the religious notion of 'special creation' - that each of the 10 million species had been individually created by God - arguing instead, like Lamarck, that new species emerged as a result of modifications in existing species, brought about by exposure to new conditions. Spencer elaborated this evolutionary theory in his essay 'Progress: its Law and Cause' ([1890] 1857) where he introduced the word 'evolution'. FollowingVon Baer, Spencer claimed that progress was defined in terms of a change from the homogenous to the heterogeneous. His originality lay in the fact that he saw this 'law' at work across the whole range of natural and human phenomena. The ten volumes ofSpencer's *magnum opus*, the 'Synthetic Philosophy', traced the operation of evolutionary principles successively in psychology, metaphysics, biology, sociology and ethics.

In his *Principles of Psychology* (1855), Spencer put forward a Lamarckian explanation of mental development. For example, intelligence was a faculty developed as a result of cumulative modifications of the mind in successive generations of organisms responding to their environment. In *First Principles* (1862), he addressed the vexed question for his Victorian readership of the relation between science and religion. ForSpencer, science entailed the deduction of general laws, such as the conservation of energy, which were not empirical generalizations, but necessary truths about empirical phenomena. But these truths could never be completely grasped. We could never know, for example, *why* energy was conserved. Such ultimate questions about the nature of reality formed what Spencer called 'the Unknowable'. Religion yielded similarly unanswerable questions about fundamental issues - such as 'does God exist, and if so, how did He come into existence?' These issues were also part of the Unknowable; Spencer was an agnostic, not an atheist - he rejected anti-evolutionary religious doctrines, but God's existence was not incompatible with his theory of evolution.

In his *Principles of Biology* (1864, 1867) Spencer acknowledged the centrality of Darwinian natural selection, but insisted that Lamarckian modifications played their part in the evolution of organisms from simple to complex structures. In *Principles of Sociology* (1876-96) he explained how, as humanity advanced, a process of

differentiation of functions occurred, and society was gradually transformed from the 'militant' type, which was characterized by authoritarianism, uniformity and status, to the 'industrial' type, which was characterized by liberty, diversity and contract. He made use of the organic analogy (likening society to an organism) to sustain his *laissez-faire* theory, by interpreting organisms as made up of individualistic parts. Finally, in *Principles of Ethics* (1879-93) he gave the law of equal freedom an evolutionary dimension by linking it to the principle that each person ought to experience the full consequences of their actions, both good and bad - a principle which entailed that the fittest survived.

Spencer has left two enduring contributions to philosophy. The first is a highly cogent analysis of the philosophical foundations of classical liberalism. *Social Statics* is a masterpiece of argumentation, not far short of the stature of a Hobbesian or Lockeian text. The second is the evolutionary idea: it was Spencer, not Darwin, who was the founder of the philosophy later known as Social Darwinism, and who coined the term 'the survival of the fittest'. Although Spencer failed to answer many questions raised by his theory of evolution, it cannot be denied that his evolutionary vision marks an important stage in our understanding of social development.

TIM S. GRAY

List of works

Spencer, H. (1851) *Social Statics: or the Conditions Essential to Human Happiness and the First of them Developed*, London: Chapman.(Spencer's best work on political philosophy; hard but rewarding.)

Spencer, H. (1855) *Principles of Psychology*, London: Williams & Norgate; 4th edn, 1899. (A comprehensive account of mind, intelligence, the nervous system, feelings, perceptions, memory, reasoning, sympathy and realism; very dense.)

Spencer, H. (1861) *Education, Intellectual, Moral and Physical*, London: Everyman's Library, 1961.(Four very readable, instructive and popular essays extolling the value of natural methods in education.)

Spencer, H. (1862) *First Principles*, London: Williams & Norgate; 6th edn, 1900.(A work in two parts: 'The Unknowable', which shows how all science led ultimately (like all religion) to a belief in an Absolute that transcended human understanding; and 'Laws of the Knowable' - a statement of the fundamental scientific principles governing the world.)

Spencer, H. (1864, 1867) *Principles of Biology*, London: Williams & Norgate, 2 vols; 2nd edn, 1898, 1899.(A comprehensive and highly technical account of morphology, physiology, reproduction, growth, development, heredity, variation and evolution.)

Spencer, H. (1873) *The Study of Sociology*, Ann Arbor, MI: Ann Arbor Paperback, 1961.(A pioneering work of popularization for the discipline of sociology, providing an easy-to-read explanation of the nature and importance of the sociological method; still a standard text.)

Spencer, H. (1876-96) *Principles of Sociology*, London: Williams & Norgate, vol. 1, 1876; 3rd edn, 1885; vol. 2, part 4, 1879; part 5, 1882; vol. 3, part 6, 1885; parts 7 and 8, 1896.(At 2,300 pages, a massive but very readable study of anthropology, social structure, the family and ceremonial, political, religious, professional and industrial institutions.)

Spencer, H. (1879-93) *Principles of Ethics*, London: Williams & Norgate, vol. 1, part 1, 1879; parts 2 and 3, 1892; vol. 2, part 4, 1891; parts 5 and 6, 1893.(An evolutionary approach to moral philosophy, in which justice and beneficence are dissected for their social value; readable but much less impressive than *Social Statics*.)

Spencer, H. (1884) *The Man Versus The State*, repr. with abridged edn of *Social Statics*, London: Williams & Norgate, 1892.(Four highly polemical essays in which Spencer denounces the increasing collectivism of governmental policy in late nineteenth-century Britain; entertaining and thought-provoking.)

Spencer, H. (1890) *Essays: Scientific, Political and Speculative*, London: Williams & Norgate, 3 vols, revised edition.(A collection of highly accessible articles published by Spencer in leading Victorian periodicals, ranging over science, philosophy, aesthetics, ethics, psychology and politics. Contains 'The Development Hypothesis' (1852) and 'Progress: its Law and Cause' (1857) in vol. 1.)

Speusippus (*c*.410-339 BC)

The Greek philosopher Speusippus was the second head of the Platonic Academy. Succeeding his uncle Plato on the latter's death, he developed his thought in interesting directions. He pursued further the tendency in the Academy to mathematicize reality that so annoyed Aristotle, postulating a complicated metaphysics, which started from a 'One' superior to being and all other qualities, and a material principle, 'multiplicity', from the union of which arose, first number, then geometrical entities, and then soul and the material world. In his hands, Plato's doctrines of first principles, of Forms, and of the union of Forms with matter, suffered transformations of which we have only imperfect reports. His later influence was greater on Neo-Pythagoreanism than on 'orthodox' Platonism, until Plotinus.

1 Life and works

Speusippus was the son of Plato's sister. He became the second head of the ACADEMY upon his uncle's death in 347 BC, and continued as head till his own death, when he was himself succeeded by Xenocrates. He may have gained the headship for family reasons, but he was a considerable philosopher in his own right, even if his original contributions have been much obscured by the loss of all his writings, and by the hostile criticisms of Aristotle. Other details of his life are hard to come by, since the surviving biography by Diogenes Laertius is most unreliable. Diogenes gives a list of thirty works by Speusippus. Most important, perhaps, were those *On Pleasure*, *On Philosophy*, *On the Gods*, *On the Soul*, and *On Pythagorean Numbers* and a treatise *On Congeners* (*homoia*) in ten volumes, which seems to have exercised the technique of division (*diaeresis*) on most of the species of the natural world. Speusippus apparently also pioneered the linking of Plato's philosophy with that of Pythagoras, which gave an impetus to the later 'Pythagoreanizing' of Platonism (see Neo-Pythagoreanism; Platonism, Early and Middle §1).

2 Metaphysics

Speusippus' concern was to carry on the work of Plato, but he developed Platonic doctrine in various interesting ways, which, although legitimate, seem to have found no other partisans in official Platonist circles before Plotinus (although certain Neo-Pythagorean speculations may perhaps be traced to his inspiration). Speusippus accepted the doctrine of two opposite principles, but modified it by laying particular emphasis on their status as 'seeds' or 'potencies' of all things. He argued that what is itself the cause of some quality in other things cannot have that quality itself in the same way, so that if the One is the cause of goodness and being for all other things, it cannot itself properly be termed good or even existent (fr. 42). The One is not even properly a creative principle - the Indefinite Dyad, or 'multiplicity', being credited with that role, as being the cause of all differentiation and individuation. The latter in turn should not be taken as 'evil', any more than the One is 'good' (fr. 44). Good and evil only arise at the level of actualized being, and perhaps only at the level of soul.

Aristotle condemns Speusippus for propounding an 'episodic' universe, with different first principles for every level of being (fr. 30). This is a satirical misrepresentation of the complexity of his position, however, which was based on the argument that a simple and unitary first principle working on an absolutely formless substratum could only produce one thing (for example, numbers), and that this could not account for the multifariousness of the actual cosmos. We must therefore postulate a process by which the product of a higher or more basic union becomes, somehow, the first principle of the next level of being, by uniting, once again, with the material principle.

This may all be less than convincing, but it is much less foolish than unquestioning reliance on Aristotle's testimony would make out. It depends, unfortunately, on accepting as evidence a passage from a work of Iamblichus, *Common Mathematical Theory* (ch. 4), which, although probably, is not indisputably Speusippan. Even Aristotle, however, if his evidence is properly understood, testifies to Speusippus' positing a first principle which is 'not yet existent' (fr. 43).

Exactly how Speusippus modified the Platonic theory of Forms is not clear, but Aristotle claims that he abandoned them in favour of numbers or 'mathematicals' (frs 31, 34). He is probably here only developing the tendency of the late Plato to mathematicize the Forms, while tidying up the confusion between the non-addible 'forms' of

numbers, and ’mathematicals’ or numbers in the ususal sense (see Platonism, Early and Middle §3). The Forms proper, as mathematical (or perhaps rather geometrical) entities, are closely allied with the soul, defined as ’the [F]orm of the omnidimensionally extended’ (fr. 54). The soul receives both number and geometrical extension from above, and these, synthesized, become its formal principle, which then combines once again with the material principle to form the physical world.

3 Ethics and logic

In ethics we have various reports of Speusippus’ views. He defined happiness (*eudaimonia*) as ‘the state of perfection in things natural’ (fr. 77), which seems to prefigure the Stoic principle of ‘living in accordance with nature’ (see Stoicism §17). The ideal to be aimed at is ’freedom from disturbance’ (*aochlēsia*) - an anticipation of the Epicurean ideal (see Epicureanism §10). This fits his attested belief that pleasure and pain are alike evils (fr. 80), the ideal being a state median between them.

In the sphere of logic, he was, as noted above, primarily an adherent of Platonic division (*diairesis*), but he developed certain distinctive theories. He held that in order to define anything adequately one must know all the differentiae of that thing in respect of everything with which it is not identical. This would logically involve knowledge of all the relations of the thing in question, however remote, with everything else in the world (fr. 63). This did not lead him to scepticism, however, but rather to a mighty effort to classify, by means of *diairesis*, as much of reality as he could, the results of which are attested in the remains of his *On Congeners*. Apart from this, his distinction between homonyms and synonyms (fr. 68) seems to have provoked Aristotle to his slightly different classification; and in the field of epistemology he seems to anticipate Aristotle in holding that first principles must be apprehended immediately if there is to be any knowledge at all (fr. 73) (see Aristotle §§4, 6).

Finally, mention may be made of Speusippus’ work *On Pythagorean Numbers*, a report of whose contents and a longish extract (on the Decad) are preserved in the pseudo-Iamblichean *Theology of Arithmetic* (fr. 28). In the first half of this work Speusippus, depending heavily on the writings of the Pythagorean Philolaus, discussed the ‘linear, polygonal, plane and solid numbers’, and also the five cosmic figures (of Plato’s *Timaeus*). The second half of the work he devoted entirely to the Decad, declaring it to be the most ’natural’ and perfect of numbers, and a model for the creator god in his creation of the world. Speusippus would seem thus to identify the ‘paradigm’ of the *Timaeus* with the Decad, while the creator or ‘demiurge’ is probably to be identified with the first principle of number. One can see here Speusippus’ ’Pythagoreanism’ coming out very strongly, as well as that mathematicization of reality to which Aristotle so strongly objected.

Spinoza, Benedict de (1632-77)

A Dutch philosopher of Jewish origin, Spinoza was born Baruch de Spinoza in Amsterdam. Initially given a traditional Talmudic education, he was encouraged by some of his teachers to study secular subjects as well, including Latin and modern philosophy. Perhaps as a result of this study, he abandoned Jewish practices and beliefs and, after receiving stern warnings, he was excommunicated from the synagogue in 1656. Alone and without means of support, he Latinized his name and took up the trade of lens grinder with the intention of devoting his life to philosophy. He remained in Amsterdam until 1660, lived for the next decade in nearby villages, and in The Hague from 1670 until his death from consumption in 1677. During these years he worked continuously on his philosophy and discussed it with a small circle of friends and correspondents. His masterpiece, Ethica Ordine Geometrico Demonstrata (Ethics Demonstrated in a Geometrical Manner), was completed in 1675; but because of its radical doctrines, it was only published after his death.

The full scope of Spinoza's Ethics is not indicated by its title. It begins with a highly abstract account of the nature of substance, which is identified with God, and culminates in an analysis of human beings, their nature and place in the universe, and the conditions of their true happiness. Written in a geometrical form modelled after Euclid, each of its five parts contains a set of definitions, axioms and propositions which are followed by their demonstrations and frequently by explanatory scholia.

The defining feature of Spinoza's thought is its uncompromising rationalism. Like other philosophers of the time, Spinoza is a rationalist in at least three distinct senses: metaphysical, epistemological and ethical. That is to say, he maintains that the universe embodies a necessary rational order; that, in principle, this order is knowable by the human mind; and that the true good for human beings consists in the knowledge of this order and a life governed by this knowledge. What is distinctive of Spinoza's brand of rationalism, however, is that it allows no place for an inscrutable creator-God distinct from his creation, who acts according to hidden purposes. Instead, Spinoza boldly identifies God with nature, albeit with nature regarded as this necessary rational order rather than as the sum-total of particular things.

In its identification of God with nature, Spinoza's philosophy is also thoroughly naturalistic and deterministic. Since nature (as infinite and eternal) is all-inclusive and all-powerful, it follows that nothing can be or even be conceived apart from it: this means that everything, including human actions and emotions, must be explicable in terms of nature's universal and necessary laws. Moreover, given this identification, it also follows that knowledge of the order of nature specified through these laws is equivalent to the knowledge of God. Thus, in sharp opposition to the entire Judaeo-Christian tradition, Spinoza claims that the human mind is capable of adequate knowledge of God.

The attainment of such knowledge is, however, dependent on the use of the correct method. In agreement with Descartes and Thomas Hobbes (the two modern philosophers who exerted the greatest influence on his thought) and thoroughly in the spirit of the scientific revolution, Spinoza held that the key to this method lies in mathematics. This conviction is obviously reflected in the geometrical form of the Ethics; but it actually runs much deeper, determining what for Spinoza counts as genuine knowledge as opposed to spurious belief. More precisely, it means that an adequate understanding of anything consists in seeing it as the logical consequence of its cause, just as the properties of a geometrical figure are understood by seeing them as the logical consequence of its definition. This, in turn, leads directly to the complete rejection of final causes, that is, the idea that things in nature (or nature as a whole) serve or have an end, and that understanding them involves understanding their end. Not only did Spinoza reject final causes as unscientific, a view which he shared with most proponents of the new science, he also regarded it as the source of superstition and a major obstacle to the attainment of genuine knowledge.

The same spirit underlies Spinoza's practical philosophy, which is marked by his clinical, dispassionate analysis of human nature and behaviour. In contrast to traditional moralists (both religious and secular), he rejects any appeal to a set of absolute values that are independent of human desire. Since the basic desire of every being is self-preservation, virtue is identified with the capacity to preserve one's being, the good with what is truly useful in this regard and the bad with what is truly harmful. In the case of human beings, however, what is truly useful is knowledge; so virtue consists essentially in knowledge. This is because knowledge is both the major weapon

against the passions (which are the chief sources of human misery) and, in so far as it is directed to God or the necessary order of nature, the source of the highest satisfaction.

Apart from the Ethics, Spinoza is best known for his contributions to the development of an historical approach to the Bible and to liberal political theory. The former is contained in the Tractatus Theologico-politicus (Theological-Political Treatise), which he published anonymously in 1670 as a plea for religious toleration and freedom of thought. The latter is contained both in that work and in the unfinished Tractatus Politicus (Political Treatise) of 1677, in which Spinoza attempts to extend his scientific approach to questions in political philosophy.

1 The geometrical method

Although Spinoza uses the geometrical method in the *Ethica Ordine Geometrico Demonstrata (Ethics Demonstrated in a Geometrical Manner)* (1677a), he does not attempt to justify or even explain it. This has led many readers to view its argument as an intricate and fascinating chain of reasoning from arbitrary premises, which, as such, never touches reality. Nevertheless, Spinoza was very much aware of this problem and dealt with it both in an important early and unfinished work on method, *Tractatus de Intellectus Emendatione (Treatise on the Emendation of the Intellect)* (1677b) and in some of his correspondence.

At the heart of the problem is the nature of the definitions (and to a lesser extent the axioms) on the basis of which Spinoza attempts to demonstrate the propositions of the *Ethics*. In a 1663 letter to a young friend, Simon De Vries, who queried him about this very problem, Spinoza offers his version of the traditional distinction between nominal and real definitions. The former kind stipulates what is meant by a word or thought in a concept. Such a definition can be conceivable or inconceivable, clear or obscure; but, as arbitrarily invented, it cannot, strictly speaking, be either true or false. By contrast, the real definition, which supposedly 'explains a thing as it exists outside of the understanding', defines a thing rather than a term (Leibniz 1966 letter 9: 106-7). Consequently, it can be either true or false.

Since the definitions of the *Ethics* are typically introduced by expressions such as 'by… I mean that', or 'a thing is called', it would seem that they are of the nominal type, which gives rise to the charge of arbitrariness. It is clear from their use, however, that Spinoza regards them as real definitions. Like the definitions of geometrical figures in Euclid, they are intended to express not merely the names used, but the objects named.

The question, then, is how can one know that one has arrived at a true definition. Spinoza's answer reveals the depth of his commitment to the geometrical way of thinking, especially to the method of analytic geometry developed by Descartes. He appeals to the example of the mathematician, who knows that one has a real definition of a figure when one is able to construct it. The definition of a figure is thus a rule for its construction, what is usually called a 'genetic definition'. Spinoza develops this point in *On the Emendation of the Intellect* ([1677b] 1985 vol.1: 39-40) by contrasting the nominal definition of a circle as 'a figure in which the lines drawn from the centre to the circumference are equal' with the genetic definition as 'the figure that is described by any line of which one end is fixed and the other movable'. The point is that the latter definition, but not the former, tells us how such a figure can be constructed and from this rule of construction we can deduce all its essential properties.

Spinoza's claim, then, is that the principles that apply to mathematical objects and perhaps other abstract entities also apply to reality as such. Thus, we have a real definition, an adequate, true or clear and distinct idea of a thing (all of these terms being more or less interchangeable) in so far as we know its 'proximate cause' and can see how its properties necessarily follow from this cause.

But if knowledge of a thing reduces to knowledge of its proximate cause, then either we find ourselves involved in an infinite regress, which would lead to a hopeless scepticism, or the chain of reasoning must be grounded in a single first principle. Furthermore, this first principle must have a unique status: if it is to provide the ultimate ground in terms of which everything else is to be explained, it must somehow be self-grounded or have the reason for its existence in itself. In the scholastic terminology which Spinoza adopts, it must be *causa sui* (self-caused). Thus, Spinoza's rationalist method leads necessarily to the concept of God, which he defines as 'a being absolutely infinite, i.e., a substance consisting of an infinity of attributes, of which each one expresses an eternal and infinite essence' (*Ethics*: I, def. 6).

Given this concept, together with other essential concepts such as substance, attribute and mode (which are treated

in the definitions of part one), the argument of the *Ethics* proceeds in a deductive manner. Its goal is to enable us to understand reality as a whole in light of this concept in just the same way that the mathematician can understand all the essential properties of a geometrical figure in terms of its concept or genetic definition. At least this is the project of part one of the *Ethics* (On God). The remainder of the work is devoted to the demonstration of the most important consequences of this result in so far as they concern the human condition.

2 Substance-monism

The first fourteen propositions of the *Ethics* contain an argument intended to show that ‘Except God, no substance can be or be conceived’ (*Ethics*: I, prop. 14). Since it follows from an analysis of the concept of substance that whatever is not itself substance must be a modification thereof, Spinoza concludes in the next proposition that ‘Whatever is, is in God, and nothing can be or be conceived without God’. Together they express Spinoza’s substance-monism, which can be defined as the complex thesis that there is only one substance in the universe; that this substance is to be identified with God; and that all things, as modes of this one substance are, in some sense ’in God’.

The argument for this thesis is based largely on the analysis of the concept of substance, defined as ‘what is in itself and is conceived through itself, i.e., that whose concept does not require the concept of another thing, from which it must be formed’ (*Ethics*: I, def. 3). This definition is quite close to Descartes who likewise made a capacity for independent existence the criterion of substance; but the two philosophers drew diametrically opposed conclusions from their similar definitions. Although Descartes held that God is substance in a pre-eminent sense, he also maintained that there are two kinds of created substance - thinking things or minds, and extended things, both of which depend for their existence on God but not on each other. For Spinoza, by contrast, there is only the one substance - God - and thought and extension are among its attributes.

Spinoza argues indirectly for his monism by criticizing the two major alternatives that a substance-based metaphysics can provide: that there is a plurality of substances of the same nature or attribute and that there is a plurality of substances with different natures or attributes. Since Descartes is committed to both forms of pluralism, both parts of the argument cut against his views. In considering Spinoza’s position, however, it should be kept in mind that his target is not merely Descartes, but an entire philosophical and theological tradition which conceived of the universe as composed of a number of finite substances created by God (see Medieval philosophy). In spite of his radical critique of scholastic ways of thinking and his appeal to mathematics as the ideal of knowledge, Descartes remained in many ways a part of that tradition.

The argument against the first form of pluralism turns on the claim that ‘In nature there cannot be two or more substances of the same nature or kind’ (*Ethics*: I, prop. 5). This is at once one of the most important and controversial propositions in the *Ethics*. It is important because of its pivotal role in the overall argument for monism, controversial because of the demonstration offered in its support which is based on a consideration of the grounds on which two or more substances might be distinguished. This could be done either on the basis of their attributes, if they are substances of different types (for example, Descartes’ thinking and extended substances), or on the basis of their modifications, if they are distinct substances of the same kind (for example, particular minds or bodies). The claim is that neither procedure can distinguish two or more substances of the same kind; and since these are the only possible ways of distinguishing substances, it follows that such substances could not be distinguished from one another.

The unsuitability of the first alternative seems obvious and would be recognized as such by Descartes. Since a substance-type for Descartes is defined in terms of its attribute, it follows that two or more substances of the same kind could not be distinguished on the basis of their attributes. As obvious as this seems, however, it was criticized by Leibniz on the grounds that two substances might have some attributes in common and others that were distinct. For example, substance *A* might have attributes *x* and *y*, and substance *B* attributes *y* and *z*. Although a Cartesian would reject this analysis on the grounds that a substance cannot have more than one attribute, Spinoza (for whom God is a substance with infinite attributes) could hardly accept this Cartesian principle. Moreover, we shall see that it is essential to the overall argument for monism to eliminate the possibility suggested by Leibniz (see Leibniz, G.W. §§4-7).

Various strategies for dealing with this problem have been suggested in the literature, perhaps the most plausible

of which turns on the principle that if two or more substances were to share a single attribute, they would have to share all, and would, therefore, be numerically identical. Although Spinoza never argues explicitly in this way, it seems a reasonable inference from his conception of attribute as 'what the intellect perceives of a substance as constituting its essence' (*Ethics*: I, def. 4). This entails that attribute *y* of substance *A* is identical to attribute *y* of substance *B* just in case they express the same nature or essence - that is, are descriptions of the same kind of thing. But if they are things of the same kind, then any attribute *A* has will be possessed by *B* as well.

Against the second alternative Spinoza argues that, since by definition substance is prior to its modifications, if we consider substance as it is in itself then we cannot distinguish one substance from another. Although the claim is surely correct, the suggestion that we set the modifications aside seems to beg the question against Descartes. After all, two Cartesian thinking substances share the same nature or attribute and are distinguished precisely by their different modifications (thoughts).

Spinoza's reasoning at this point is unclear, but one could respond that, on the hypothesis under consideration, the substances must be assumed to be indistinguishable prior to the assignment of modifications. Moreover, it follows from this that the assignment of modifications could not serve to distinguish otherwise indistinguishable substances unless it is already assumed that they are numerically distinct. In other words, while we can distinguish two Cartesian substances by means of their modifications, we can only do so by presupposing that the distinct modifications belong to numerically distinct substances. But it is just this assumption to which the Cartesian is not entitled.

3 Substance-monism (cont.)

This, however, is only the first step in the argument for monism. It is also necessary to rule out the possibility of a plurality of substances of different kinds. Essential to this project is the demonstration that substance is infinite not merely 'in its own kind', that is, unlimited by anything of the same kind, but 'absolutely infinite', that is, all-inclusive or possessing all reality, which, for Spinoza, means infinite attributes. For example, Descartes' extended substance is infinite in the first sense because it is not limited or determined by anything outside itself (for example, empty space); but it is not infinite in the second and decisive sense because it does not constitute all reality. Moreover, this is precisely why the first sense of infinity is not sufficient to preclude a plurality of substances.

The basis of the argument for the absolute infinity of substance is the claim that 'The more reality or being each thing has the more attributes belong to it' (*Ethics*: I, prop. 9). This is a direct challenge to the Cartesian conception of substance as defined in terms of a single attribute, resting on the dual assumption that some things can possess more reality than others and that this superior degree of reality is manifested in a greater number of attributes. Unfortunately, in defence of this claim Spinoza merely refers to the definition of attribute as 'what the intellect perceives of a substance as constituting its essence' (*Ethics*: I, def. 4). Nevertheless, it does seem possible to understand Spinoza's point if we interpret attributes as something like distinct descriptions under which substance or reality can be taken. Consider, for example, a simple human action such as raising an arm. Although it may be possible to give a complete neurophysiological account of such an action in terms of impulses sent to the brain, the contraction of muscles and the like, one could still argue that no such account, no matter how detailed, is adequate to understanding it as an action. This requires reference to psychological factors such as the beliefs and intentions of an agent, which in Spinoza's metaphysics belong to the attribute of thought. Thus, we might say both that there is 'more reality' to an action than is given in a purely neurophysiological account and that this 'greater reality' can be understood as the possession of a greater number of attributes.

It follows from this that a being possessing all reality - that is, God, or the *ens realissimum* (most real being) of the tradition - may be described as possessing infinite attributes. It also follows that the Cartesian must either accept the possibility of a substance with infinite attributes or deny the possibility of God. And since the orthodox Cartesian could hardly do the latter, the former must be admitted.

Even granting this, however, at least two problems remain. One is how to understand the infinity of attributes. This might mean either that substance possesses infinitely many attributes, of which the human mind knows only two (thought and extension), or that it possesses all possible attributes, which is compatible with there being only two. Although scholars are divided on the point and there are indications from Spinoza's correspondence that he held

the former view, it is important to realize that the argument for monism requires only the latter. This argument turns on the claim that God is a substance that possesses all the attributes there are and, therefore, that there are none left for any other conceivable substance. Combining this with the proposition that two substances cannot share an attribute, it follows that there can be no substance apart from God.

The second problem is that the argument up to this point is completely hypothetical. It shows that *if* we assume the existence of God, defined as a substance possessing infinite attributes, then it follows that no substance apart from God is possible; but it has not yet established the existence of substance so conceived. Spinoza had, however, laid the foundation for this claim in *Ethics* (I, prop. 7) with the demonstration that existence pertains to the nature of substance; so it remains merely to apply this result to God. This is the task of proposition eleven, which contains Spinoza's arguments for the existence of God. Spinoza offers three separate proofs, the major one being his version of the ontological argument, which was first developed by Anselm and later reformulated by Descartes (see Anselm §4; Descartes, R. §6). Like his predecessors, Spinoza attempts to derive God's existence from the mere concept; but unlike them he makes no reference to God's perfection. Instead he appeals merely to the definition of God as a substance, from which it follows (by proposition seven) that God necessarily exists.

The nerve of the overall argument is, therefore, the proposition that existence pertains to the nature of substance or, equivalently, that its essence necessarily involves existence. Moreover, Spinoza's argument for this claim reveals the extent of his rationalism. From the premise that substance cannot be produced by anything external to itself (since such a cause would have to be another substance of the same nature, which has already been ruled out), he concludes that it must be the cause of itself, which is just to say that existence necessarily follows from its essence. Underlying this reasoning is what, at least since Leibniz, is usually termed the principle of sufficient reason, that is, the principle that everything must have a ground, reason or cause (these terms often being used interchangeably) why it is so and not otherwise. Although followers of Leibniz such as Christian Wolff attempted to demonstrate this principle, Spinoza, like most rationalists before Kant (including Leibniz), seems to have regarded it as self-evident (see Wolff, C. §6).

This characterization of substance as self-caused or self-sufficient being anticipates its identification with God. Quite apart from the question of its validity, however, perhaps the most interesting feature of Spinoza's argument for the necessary existence of his God-substance is that it is at the same time an argument for the non-existence of God the creator. Nevertheless, it should not be inferred from this that the result is purely negative or that Spinoza is concerned to deny the existence of God in every sense. On the contrary, his real concern in the opening propositions of the *Ethics* is to show that necessary existence and, therefore, the property of being a self-contained, self-explicated reality, is to be predicated of the order of nature as a whole rather than of some distinct and inscrutable ground of this order. And this also expresses the deepest meaning of his monism.

4 God and the world

Spinoza's monism does not, however, mean the end of all dualities. In fact, the identification of God with nature leads immediately to the distinction between two aspects of nature, which he terms *natura naturans* (active or generating nature), and *natura naturata* (passive or generated nature). The former refers to God as conceived through himself, that is, substance with infinite attributes, and the latter to the modal system conceived through these attributes (which includes, but is not identical to, the totality of particular things). Consequently, the task is to explain the connection between these two aspects of nature, a task which is the Spinozistic analogue to the traditional problem of explaining the relationship between God and creation.

Like the theologians, whose procedure he adopts even while subverting their claims, Spinoza divides his analysis into two parts: a consideration of the divine causality as it is in itself (or as *natura naturans*) and a consideration of it as expressed in the modal system (or as *natura naturata*). Given what we have already seen, the former holds few surprises. The basic claim is that 'From the necessity of the divine nature there must follow infinitely many things in infinitely many ways, (i.e., everything which can fall under an infinite intellect)' (*Ethics*: I, prop. 16). Spinoza here characterizes both the nature and extent of the divine causality or power. By locating this power in the 'necessity of the divine nature' rather than creative will and by identifying its extent with 'everything which can fall under an infinite intellect', that is, everything conceivable, Spinoza might seem to be denying freedom to God. Certainly he is denying anything like freedom of choice. To object on these grounds, however, is to ignore the conception of freedom which Spinoza does affirm and to appeal to the very anthropomorphic conception of the

deity against which his whole analysis is directed. To be free for Spinoza is not to be undetermined but to be self-determined (*Ethics*: I, def. 7); and God, precisely because he acts from the necessity of his own nature, is completely self-determined and, therefore, completely free.

The question of the relationship between God, so construed, and the ‘infinitely many things’ or modes that supposedly follow from God in ‘infinitely many ways’, which is perhaps the central question in Spinoza’s metaphysics, is greatly complicated by the fact that Spinoza distinguishes between two radically distinct types of modes. As modifications of the one substance, both types are dependent on and in a sense ‘follow from’ God, but they do so in quite different ways.

First, there are those modes that either follow directly from an attribute of substance or follow from one that does directly follow. These are termed respectively ‘immediate’ and ‘mediate eternal and infinite modes’. They are eternal and infinite because they follow (logically) from an attribute of substance, but they are not eternal and infinite in the same manner as substance and its attributes. Although Spinoza tells us very little about these modes in the *Ethics*, we know from his correspondence and the *Short Treatise on God, Man, and his Well-Being* (*c.*1660-5)) which contains the earliest statement of his system, that he regarded ‘motion’ or ‘motion and rest’, and ‘intellect’ or ‘infinite intellect’, as immediate eternal and infinite modes in the attributes of extension and thought respectively. As an example of a mediate eternal and infinite mode, he mentions only the ‘face of the whole universe’ (*facies totius universi*) which pertains to extension.

Given the highly schematic and fragmentary nature of the surviving accounts of these eternal and infinite modes, any interpretation is hazardous. Nevertheless, both their systematic function as mediators between God or substance and the particular things in nature (finite modes), and the names chosen for the modes of extension, suggest that the latter are best construed as the fundamental laws of physics. In fact, Spinoza’s characterization of motion and rest as an eternal and infinite mode may be seen as his attempt to overcome a basic difficulty in Cartesian physics. Having identified matter with extension, Descartes could not account for either motion or the division of matter into distinct bodies without appealing to divine intervention. On Spinoza’s view, however, this is not necessary, since extended substance has its principle within itself. Otherwise expressed, matter is inherently dynamical, a property which cannot be explained in terms of Descartes’ purely geometrical physics.

The ‘face of the whole universe’, which is identified with corporeal nature as a whole, may be understood in a similar fashion. By claiming that this is a mediate eternal and infinite mode of extension following directly from motion and rest, Spinoza is implying that the proportion of motion and rest in corporeal nature as a whole remains constant, even though it may be in continual flux in any given region. Moreover, this is equivalent to affirming the principle of the conservation of motion, which is a basic principle of Cartesian physics.

Viewing Spinoza’s account in the light of seventeenth-century physics also helps to understand his doctrine of finite modes, or the series of particular things, which is usually regarded as one of the more problematic aspects of his metaphysics. The problem is how to conceive the relationship between the series of these modes and God. If one assumes that, like the mediate eternal and infinite modes, they follow mediately from the attributes of God, then they too become eternal and infinite; but this is absurd, since it is of the essence of such modes to be transitory. If, however, one denies that they follow from God at all, then the dependence of all things on God, and with it Spinoza’s monism, is negated. Accordingly, it must be explained how, in spite of their finitude, particular things and occurrences depend on God and participate in the divine necessity.

Spinoza’s solution to this dilemma consists in claiming that the series of finite modes constitutes an infinite causal chain, wherein each finite mode is both cause and effect of others, *ad infinitum*, while the entire series (viewed as a totality) is dependent on the attributes of God and the eternal and infinite modes. Expressed in scientific terms, this means that every occurrence in nature is to be understood in terms of two intersecting lines of explanation. On the one hand, there is a set of general laws which for Spinoza are logically necessary (since they follow from the divine attributes); on the other hand, there must be a set of antecedent conditions. Both are required to explain a given phenomenon, say a clap of thunder. Clearly, no such explanation is possible without appealing to the relevant physical laws; but of themselves these laws are not sufficient to explain anything. It is also necessary to refer to the relevant antecedent conditions: in this case the state of the atmosphere. But, given these laws and the atmospheric state at t_1, it is possible to deduce the occurrence of thunder at t_2. And this means that nature is to be conceived as a thoroughly deterministic system.

Spinoza concludes from this that ‘In nature there is nothing contingent, but all things have been determined from the necessity of the divine nature to exist and to produce an effect in a certain way’ (*Ethics*: I, prop. 29). But because of this denial of contingency, he is sometimes accused of conflating determinism with the stronger thesis (usually termed ‘necessitarianism’) according to which the entire order of nature, that is, the infinite series of finite modes, could not have been different. The point is that determinism entails merely that, given the laws of nature and the set of appropriate antecedent conditions, any particular occurrence is necessary; but this leaves room for contingency, since it leaves open the possibility of a different set of antecedent conditions.

In response, one might distinguish between a consideration of finite modes, or a subset thereof, taken individually and a consideration of the series of such modes as a whole. The former fails to eliminate contingency, since any particular mode or subset of modes, viewed in abstraction from the whole, can easily be thought (or imagined) to be different. But the same cannot be said of the series taken as a whole. Since this series (considered as a totality) depends on God, it could not be different without God being different (which is impossible). The problem here is with the idea that the set of modes as a whole requires an explanation or grounding distinct from that of its constituent elements. Such a move is usually dismissed as a ‘category mistake’ (treating a collection as if it were a higher-order individual). But if it is a mistake, it is one to which Spinoza is prone in virtue of his rationalism; for nothing could be less Spinozistic than the idea that while particular events may be intelligible, the order of nature as a whole is not. And since for Spinoza making something intelligible involves demonstrating its necessity, this commits him to necessitarianism.

5 The human mind

Just as the target of part one of the *Ethics* is the dualism of God and created nature, so that of part two is the dualism of mind and body. Rather than holding with Descartes that the mind and the body are two distinct substances that somehow come together to constitute a human being, Spinoza maintains that they constitute a single individual expressed in the attributes of thought and extension. Since the fundamental modifications of thought are ideas (other modifications, such as desires and volitions, presuppose an idea of their object), while those of extension are bodies, this means that the human mind is an idea of a rather complex sort and that together with its correlate or object in extension (the body), it constitutes a single thing or individual. The great attractiveness of this view, particularly when contrasted with both Descartes’ dualism and Hobbes’ reductive materialism, is that it allows for the conception of persons as unified beings with correlative and irreducible mental and physical aspects (see Hobbes, T.). Unfortunately, this attractiveness is diminished considerably by its inherent obscurity. How can the mind be identified with an idea (even a very complex one)? And how can such an idea constitute a single thing with its object?

The place to begin a consideration of these questions is with Spinoza’s elusive conception of an idea, which he defines as ‘a conception of the mind that the mind forms because it is a thinking being’ (*Ethics*: II, def. 3). As he makes clear in his explication of this definition through the distinction between conception and perception, the emphasis falls on the activity of thought. To say that the mind has the idea of *x* is to say that it is engaged in the activity of conceiving *x*, not merely passively perceiving its mental image. Indeed, in one sense of the term, an idea for Spinoza just is the act of thinking. Moreover, this helps to remove at least some of the mystery in the identification of the mind with an idea. On the Spinozistic view, this means that the mind is identified with its characteristic activity, thinking; that its unity is the unity of this activity.

As acts of thinking, ideas may be identified with beliefs or ‘believings’; but this reflects only one dimension of Spinoza’s conception of an idea. For beliefs have propositional content and this, too, is an essential aspect of every idea. In short, ideas have both psychological and logical (or epistemological) properties. Moreover, although Spinoza is often charged with conflating these, he was well aware of the difference and of the importance of keeping them apart. This is evident from his appeal to the scholastic distinction, also invoked by Descartes, between the ‘formal’ and the ‘objective reality’ of ideas. The former refers to the psychological side of ideas as acts of thinking or mental events, the latter to their logical side or propositional content. Construed in the former way, ideas have causes which, in view of the self-contained nature of each attribute, are always other ideas. Construed in the latter way, they have rational grounds which likewise are always other ideas.

Spinoza differs from Descartes, however, in his understanding of the objective reality of ideas. For Descartes, talk

about the objective reality of an idea as it exists in someone's mind refers to that idea *qua* intentional object to which a 'real' (extra-mental) object may or may not correspond. For Spinoza, by contrast, the idea viewed objectively just is its object (a corresponding mode of extension) as it exists in thought. This is a direct consequence of Spinoza's mind-body monism and we shall see that it has important implications for his epistemology.

6 The human mind (cont.)

Our immediate concern, however, is with the implications of this conception of ideas for Spinoza's account of the mind-body relationship. Unquestionably, the key feature in this account is the principle that 'The order and connection of ideas is the same as the order and connection of things' (*Ethics*: II, prop. 7). Taken by itself, this might be viewed as the assertion of a parallelism or isomorphism between the two orders, thereby leaving open the possibility that the elements contained in these orders might be ontologically distinct, as, for example, in Leibniz's pre-established harmony (see Leibniz, G.W. §§4-7). In the scholium attached to this proposition, however, Spinoza indicates that he takes it to entail something more. Thus, he explains that just as thinking and extended substance are 'one and the same substance, comprehended now under this attribute and now under that. So also a mode of extension and the idea of that mode are one and the same thing, but expressed in two ways' (*Ethics*: II, prop. 7). In other words, rather than there being two series, one of extended things and the other of ideas, there is only a single series of finite modes, which may be regarded from two points of view, or taken under two descriptions. This also defines the sense in which Spinoza affirms an identity between mind and body. In claiming that mind and body constitute the same thing, he is not asserting that ultimately there is only one set of properties (which would make him a reductionist like Hobbes); rather, he is denying that the two sets of properties or, better, the two descriptions, can be assigned to two ontologically distinct things (as they are for Descartes).

Although the proposition makes a completely general claim about the relationship between the attributes of thought and extension, and their respective modifications, it also provides the metaphysical foundation for Spinoza's descent from the attribute of thought to its most interesting finite modification - the human mind. The descent is somewhat circuitous, however, since in subsequent propositions Spinoza stops to dwell on some topics that do not seem directly germane, such as the status of ideas of non-existent things; but the main line of the argument is clear enough. As a finite mode of thought, the essence of the mind must be constituted by an idea. Since the mind itself is something actual (an actual power of thinking), it must be the idea of an actually existing thing. And since this actually existing thing can only be a corresponding modification of extension, that is, a body, Spinoza concludes that 'The object of the idea constituting the human mind is the body, or a certain mode of extension which actually exists, and nothing else' (*Ethics*: II, prop 13).

Even if one accepts Spinoza's premises and the chain of reasoning leading to the conclusion, this 'deduction' of the human mind as the idea of the body raises at least two major questions. One is how to reconcile the identification of the body as the unique object of the mind with the capacity of the mind to know and, therefore, presumably, to have ideas of things quite distinct from the body with which it is identified. This will be discussed in the next section in connection with Spinoza's epistemology. The other question concerns how this enables us to understand what is distinctive about the human mind. As Spinoza himself remarks in the scholium to proposition thirteen, this result is perfectly general, applying no more to human beings than to other individuals. And, by way of accentuating the point, he adds that these other individuals are 'all animate [*animata*], albeit in different degrees'. Now, given the principles of Spinoza's metaphysics, it certainly follows that there must be 'in God' an idea corresponding to every mode of extension in the same way as an idea of a human body corresponds to that body. Thus, the claim that the human mind is the idea of the body may serve to determine its ontological status, but it does not enable us to understand its specific nature and activity. But unless Spinoza's deduction of the mind can accomplish this result, it cannot be judged a success, even on his own terms. Moreover, by suggesting that all individuals in nature are to some extent *animata*, he introduces a fresh element of paradox into his discussion. Indeed, this is particularly so if we take Spinoza to be claiming that something like a soul, or a rudimentary mind, must be attributed to all individuals.

Since the Latin '*animatus*' is cognate with the English 'animate', the sense of paradox can be lessened somewhat if we take the claim to be merely that all individuals are alive. Although this itself might seem bizarre, it becomes more plausible when one considers Spinoza's conception of life which, in the appendix to his early work

Descartes's 'Principles of Philosophy', he defines as 'the force through which things persevere in their being'. Since, as we shall see, Spinoza's conatus doctrine consists in the claim that each thing, in so far as it can, strives to preserve its being, it follows that every thing is in this sense 'alive'. And from this it is perhaps not too large a step to the conclusion that every thing has a 'soul' in the sense of an animating principle. But, of course, it does not follow from this that everything has a mental life that is even remotely analogous to that enjoyed by the human mind.

This makes it incumbent on Spinoza to account for the different degrees of animation and to explain thereby the superiority of the human mind to the 'minds' of other things in the order of nature. And he proceeds to do so by focusing on the nature of body. In essence, Spinoza's view is that 'mindedness' is a function of organic complexity; so the greater the capacity of a body (that is, brain and central nervous system) to interact with its environment, the greater the capacity of the mind to comprehend it. Thus, in a kind of speculative biophysics, Spinoza attempts to demonstrate that the human body is, indeed, a highly complex individual, which stands in a complex and reciprocal relationship with its environment. Although this account is extremely cryptic, it is also highly suggestive and points in the direction of an analysis of the phenomenon of life that goes far beyond the crude mechanism of the Cartesians (for whom the body is merely a machine). Perhaps more to the point, it also provides a theoretical basis for locating conscious awareness and rational insight on a continuum of mental powers, all of which are strictly correlated with physical capacities, rather than viewing them with Descartes as unique properties of a distinct mental substance.

7 Theory of knowledge

Although Spinoza does not assign to epistemological questions the priority given them by Descartes and the British empiricists, he certainly does not neglect them. In fact, his analysis of human knowledge, which follows directly upon his account of the mind, may be viewed as an attempt to show how the human mind, so conceived, is capable of the kind of knowledge presupposed by the geometrical method of the *Ethics*. In Spinoza's own terms, this means that what must be shown is nothing less than that the human mind is capable of adequate knowledge of the eternal and infinite essence of God.

Since adequate knowledge rests on adequate ideas, Spinoza must demonstrate that the human mind possesses such ideas. He defines an adequate idea as one which 'considered in itself, without relation to an object, has all the properties or intrinsic denominations of a true idea' (*Ethics*: II, def. 4). The term 'intrinsic' functions to rule out the extrinsic feature of a true idea: namely, agreement with its object. Thus, Spinoza's view is that truth and adequacy are reciprocal concepts: all adequate ideas are true (agree with their object) and all true ideas are adequate. Moreover, this enables him to dismiss the radical doubt regarding even our most evident conceptions envisaged by Descartes, which is supposedly overcome only by the manifestly circular appeal to God as the guarantor of truth. Since adequacy is an intrinsic feature of all true ideas, it serves as the criterion of truth. Consequently, someone who has a true idea immediately recognizes it as such and there is no longer room for Cartesian doubt. As Spinoza puts it with uncharacteristic elegance: 'As the light makes both itself and the darkness plain, so truth is the standard both of itself and of the false' (*Ethics*: II, prop. 43, scholium).

The intrinsic property through which truth manifests itself is explanatory completeness. An idea of *x* is adequate and, therefore, true just in case it suffices for the determination of all of the essential properties of *x*. For example, the mathematician's idea of a triangle is adequate because all of the mathematically relevant properties of the figure can be deduced from it. Conversely, the conception of a triangle by someone ignorant of mathematics is inadequate because it is incapable of yielding any such consequences.

It does not follow from this, however, that inadequate ideas are simply false. On the contrary, since every idea agrees with its object, every idea must in some sense be true. Specifically, 'All ideas, insofar as they are related to God, are true' (*Ethics*: II, prop. 32). Error or falsity arises because not every idea possessed by the human intellect is related by that intellect to God, that is, viewed as a determinate member of the total system of ideas. In other words, error or falsity is a function of incomplete comprehension, of partial truth being taken as complete. Spinoza illustrates the point by an example also used by Descartes: the imaginative, non-scientific idea of the sun as a disk in the sky located a few hundred feet above the earth. This idea is 'true' in so far as it is taken as an accurate representation of how the sun appears to us under certain conditions; but since it is not understood in this way by someone ignorant of optics and astronomy, such a person's idea is false in the sense of being inadequate or

incomplete. It is not, however, 'materially false' in the Cartesian sense that there is nothing in the realm of extension corresponding to it.

Correlative with the distinction between inadequate and adequate ideas is a contrast between two mutually exclusive ways in which ideas can be connected in the mind: either according to the 'common order of nature' or the 'order of the intellect'. The former refers to the order in which the human mind receives its ideas in sense perception or through imaginative association. Since these correspond exactly to the order in which the body is affected by the objects of these ideas, it reflects the condition of the body in its interaction with its environment rather than the true nature of an independent reality. And from this Spinoza concludes that all such ideas are inadequate. In fact, he argues that, in so far as its ideas reflect this order or, equivalently, are based on sense perception or imagination, the mind is incapable of adequate knowledge of either external objects in nature, its own body or even of itself. Spinoza also contends, however, that adequate knowledge of all three is possible in so far as the mind conceives things according to the order of the intellect, that is, the true order of logical and causal dependence, which, once again, is precisely why the correct method is so essential.

8 Theory of knowledge (cont.)

The central problem of Spinozistic epistemology is thus to explain how conception according to the order of the intellect is possible for the human mind. This is a problem because the possibility of such conception seems to be ruled out by the ontological status of the mind as the idea of the body. For how could a mind, so conceived, have any ideas that do not reflect the condition of its body? The gist of Spinoza's answer is that there are certain ideas that the human mind possesses completely and hence can conceive adequately because, unlike ideas derived from sense perception or imagination, they do not 'involve', or logically depend on, ideas of particular modifications of the body.

Spinoza's doctrine is particularly obscure at this point; but it is perhaps best approached by comparing it to the doctrine of innate ideas, which was appealed to by Descartes and later Leibniz to deal with a similar problem. Like Spinoza, they held that sensory experience cannot account for the possibility of knowledge of necessary and universal truth. Instead, they claimed that the source of such knowledge must lie in the mind and reflect its very structure. This was not understood in a naïve psychological sense, however, as if an infant were born with knowledge of the basic principles of mathematics. Rather, innate ideas were viewed more as dispositions that pertain essentially to the human mind, but of which individuals are not necessarily conscious (see Innate knowledge).

Although Spinoza's account of the mind as the idea of the body precludes the distinction drawn by Descartes between innate and adventitious ideas (that is, those that come from the mind and those that come from sensory experience), it does allow for an analogous distinction, which leads to much the same result. This is the distinction between ideas that are correlated with specific features of particular bodies and those whose correlates are common to all bodies or a large proportion thereof. The latter fall into two classes, corresponding to two levels of generality, which Spinoza terms respectively 'common notions' and 'adequate ideas of the common properties of things'. Their distinctive feature is that they do not arise in connection with an encounter with any particular kind of thing; and this enables Spinoza to claim that the mind possesses them in their totality and comprehends them adequately. Unfortunately, he does not provide examples of either class of these adequate ideas; but it seems reasonable to assume that the common notions include the axioms of geometry and first principles of physics (which are common to all bodies). Correlatively, since the adequate ideas of common properties of things correspond to properties that are common and peculiar to the human body and to other bodies by which it is affected (*Ethics*: II, prop. 39), it is likely that Spinoza was here referring to the basic principles of biology (or perhaps physiology). In any event, the crucial point is that the commonality of these ideas enables the human mind to grasp them completely, which is what is required for adequate knowledge.

The epistemological teaching of the *Ethics* culminates in the distinction between three kinds of knowledge (*Ethics*: II, prop. 40, scholium 2). The first is an experientially determined knowledge, which can be based either on the perception of particular things or on signs, which for Spinoza includes both sensory and memory images. The second is knowledge through reason, which is based on common notions and ideas of the common properties of things. Since the former mode of knowledge involves inadequate ideas and the latter adequate ones, this is just the contrast one would expect. At this point, however, Spinoza unexpectedly introduces a third kind of knowledge,

termed ‘intuitive knowledge’ (*scientia intuitiva*), which supposedly ‘proceeds from an adequate idea of the formal essence of certain attributes of God to the adequate knowledge of the essence of things’. He also attempts to clarify the difference between all three by comparing their respective treatments of the problem of finding a fourth proportional. Someone with the first kind of knowledge proceeds by rule of thumb, multiplying the second by the third and dividing the product by the first, thereby arriving at the correct answer without really understanding the principle at work. Someone with the second kind understands the principle and is, therefore, able to derive the result from the common property of proportionals as established by Euclid. Someone who possesses the third kind of knowledge, however, immediately grasps the result, without applying a rule or relying on a process of ratiocination.

Although both reason and intuition are sources of adequate knowledge, Spinoza recognizes two senses in which intuition is superior. First, whereas the province of reason concerns general truths based on common notions and consequently is abstract and general, that of intuition concerns the individual case and consequently is concrete and particular. This difference is not directly germane to Spinoza’s epistemology, but it plays a significant role in his practical philosophy. Second, and of more immediate relevance, knowledge from general principles alone remains ultimately ungrounded. Accordingly, as in Spinoza’s example, while the conclusion is inferred correctly from the principle, the status of the principle itself remains in question. Within the framework of Spinoza’s metaphysics, this question can be resolved only by grounding the principle in the nature of God, which is supposedly what is accomplished by intuitive knowledge.

But grounding our knowledge of things in the eternal and infinite essence of God obviously presupposes a knowledge of that essence; and even for a rationalist such as Descartes, this far transcends the capacity of the human intellect. This is not the case for Spinoza, however, given his unique conception of God. Since ‘it is of the nature of reason to regard things as necessary, not as contingent’ (*Ethics*: II, prop. 44), and since to conceive things in this way is to conceive them in relation to God, Spinoza in effect concludes that in so far as the mind has an adequate idea of anything at all, it must have an adequate idea of God. Moreover, since it presumably has been established that the human mind knows some things (has some adequate ideas), it follows that the mind has an adequate idea of God. Although initially this seems paradoxical in the extreme, it becomes much less so if one keeps in mind the nature of Spinoza’s God.

9 The emotions

Nowhere is Spinoza’s unique combination of rationalism and naturalism more evident than in his doctrine of the emotions, the topic of the third part of the *Ethics*. Appealing to the conception of the mind as the idea of the body, he defines the emotions or affects (*affectiones*) as ‘affections of the body by which the body’s power of acting is increased or diminished, aided or restrained, and at the same time, the ideas of these affections’ (*Ethics*: III, def. 3). Emotions are, therefore, directly related to the body’s capacity for action or level of vitality and have both a physiological and a psychological side. Moreover, given mind-body identity, these are seen as distinct expressions of the same thing. Thus, a conscious desire for some object and a corresponding bodily appetite are the same state considered under the attributes of thought and extension respectively.

Among other things, Spinoza’s conception of mind precludes the assumption of a distinct power of will through which the mind can exert control over the bodily appetites. Strictly speaking, there is nothing pertaining to the mind but ideas, that is, acts of thinking; but these ideas have a conative or volitional and affective as well as a cognitive dimension. In other words, to have an idea of *x* is to have not only a belief or propositional attitude with respect to *x*, but also some sort of evaluative attitude (pro or con). Moreover, this enables Spinoza to avoid concluding from his denial of will that the mind is powerless, condemned to being the passive observer of the bodily appetites. The mind, for Spinoza, is active in so far as it is the ‘adequate’, that is sufficient, cause of its states; and it is such in so far as it possesses adequate ideas, that is, in so far as its desires and hence its ‘decisions,’ are grounded in rational considerations - for example, when it desires a particular food because of the knowledge (adequate idea) that it is nutritious. Conversely, it is passive when its desires reflect inadequate ideas connected with sense perception and imagination.

But regardless of whether it is active or passive, the mind’s evaluative attitude is always an expression of its conatus, which is identified with the endeavour of each thing to persist in its own being. This endeavour pertains to the nature of every finite mode; but in human beings, who are conscious of this endeavour, it becomes the desire

for self-preservation. Spinoza thus agrees with Hobbes in regarding this desire as the basic motivating force in human behaviour. But rather than inferring this from observation, he deduces it from the ontological status of human beings as finite modes. This allows him to affirm not merely that this desire is, as a matter of fact, basic to human beings, but that it constitutes their very essence. Accordingly, one can no more help striving to preserve one’s being than a stone can help falling when it is dropped.

Perhaps under the influence of Hobbes, Spinoza also identifies this endeavour to preserve one’s being with a striving for greater perfection, understood as an increased power of action. Just as Hobbes insisted that individuals continually desire to increase their power because there can never be any assurance that it is sufficient for self-preservation, so Spinoza maintains that the endeavour of an organism to preserve its existence is identical to its effort to increase its power of acting or level of vitality. This is because anything that lessens an organism’s power, lessens its ability to preserve its being, while anything that increases this power enhances that ability.

The so-called primary emotions (pleasure, pain and desire) are correlated with the transition from one state of perfection or level of vitality to another. Thus, pleasure or joy (*laetitia*) is defined as the emotion whereby the mind passes to a greater state of perfection, and pain or sorrow (*tristitia*) is that by which it passes to a lesser state. Both reflect changes brought about in the organism through interaction with its environment. Although particular desires are directly related to pleasures, desire is none the less a distinct primary emotion because a desire for a particular object viewed as a source of pleasure is distinct from that pleasure.

The great bulk of part three of the *Ethics* is devoted to showing how the other emotions can be derived from the primary ones by means of combination and association with other ideas. Central to this project is the thesis that pleasure, pain and desire relate to present objects, which cause the affections of the body to which these emotions (as ideas) correspond. Accordingly, the derivative emotions are all species or combinations of pleasure, pain or desire, which are directed in various ways either to objects that do not presently affect the body or to those that are not themselves directly the cause of these affections. For example, love and hatred are defined respectively as pleasure and pain accompanied by the idea of an external cause. Similarly, hope and fear are understood as pleasures and pains that arise under conditions of uncertainty, when the image of some past or future thing is connected with an outcome that is in doubt. This analysis is extended with considerable subtlety, showing, among other things, how ambivalence is possible; and how, through various forms of association, the mind can come to feel love, hatred, hope or fear towards things with regard to which it has no direct desire or aversion. The key point, however, is that, like everything else in nature, these emotions do not arise capriciously, but in accordance with universal and necessary laws.

But these laws concern the mind only in so far as it is passive, that is, in so far as its ideas are inadequate and it is, therefore, only the partial or inadequate cause of its affections. Accordingly, at the end of his lengthy account of the passive emotions or passions, Spinoza turns briefly to the active emotions, which are connected with adequate ideas. Of the three primary emotions, only desire and pleasure have active forms, because only they can be grounded in adequate ideas. Active desire has already been described; it is simply rational desire. Active pleasure is a concomitant of all adequate cognition; for when the mind cognizes anything adequately it is necessarily aware of this and, therefore, of its own power or activity. And it is the awareness of its activity, not the nature of the object known, that is the source of pleasure. Finally, since pain or sorrow reflects a diminution of the mind’s power of activity (adequate ideas), Spinoza concludes that it can never be the result of this activity, but must always result from the mind’s inadequate knowledge and determination by external forces.

10 Moral theory

Spinoza’s moral theory is based on his analysis of the emotions and is formulated with the same clinical detachment as the remainder of the *Ethics*. In sharp contrast to Judaeo-Christian moralists and their secular counterparts, he proposes neither a set of obligations nor a list of actions, the performance of which make one morally ‘good’, and their omission or neglect morally ‘evil’: all such moral systems and concepts are based on inadequate ideas, particularly the ideas of free will and final causes. Instead, he is concerned to determine the means through which and the extent to which human beings, as finite modes, are capable of attaining freedom, understood as the capacity to act rather than to be governed by the passions. Morality in the traditional sense is, therefore, replaced by a kind of therapy, which is one reason why Spinoza is frequently compared with Freud. The concept of virtue is retained; but it is given its original meaning as power, which is itself understood in light of the

conatus doctrine as the power to preserve one’s being. In the same spirit, the good is identified with what is truly useful in this regard and the bad with what is truly harmful.

In spite of his amoralism, Spinoza does not equate virtue with the ability to survive or the good with what is in one’s self-interest, narrowly conceived. What matters is not mere living, but living well; and this means being active - that is, being, to the fullest extent possible, the adequate cause of one’s condition. And since being an adequate cause is a function of adequate ideas, virtue is directly correlated with knowledge. Knowledge, however, has a dual role in the Spinozistic scheme. It is the major weapon in the struggle against the passions, since it is through understanding our passions and their causes that we are able to gain some measure of control over them. But it is also itself constitutive of the good life, since our freedom is manifested essentially in the exercise of reason.

Nevertheless, Spinoza was under no illusions about the extent of the power of reason. Human virtue or perfection is merely relative and its attainment a rare and difficult feat. Thus, the first eighteen propositions of part four of the *Ethics*, which is significantly entitled ‘On Human Bondage, or the Powers of the Affects’, are concerned with the limits of the power of reason in its conflict with the passions. The basic point is that, as finite modes, the force through which human beings endeavour to preserve their being is infinitely surpassed by other forces in nature and, therefore, to some extent at least, they will always be subject to the passions. Moreover, knowledge itself has no motivating power simply *qua* knowledge, but only in so far as it is also an affect. Now knowledge is, indeed, an affect for Spinoza, since all ideas have an affective component, that is, possess a certain motivational force. But, as he attempts to demonstrate by means of an elaborate psychodynamics, the affective component of even an adequate idea is strictly limited and can easily be overcome by other (inadequate) ideas, which is why rational desires, based on a knowledge of what is truly beneficial, all too frequently give way to irrational urges.

After his analysis of human weakness, Spinoza turns to the question of what reason, limited as its power may be, prescribes. The basic answer, of course, is knowledge and, given Spinoza’s metaphysics and epistemology, this ultimately means knowledge of God. Thus, he concludes that ‘Knowledge of God is the mind’s greatest good; its greatest virtue is to know God’ (*Ethics*: IV, prop. 28). At this point, however, the discussion takes a surprising turn, one which indicates both the complexity of, and the inherent tensions in, Spinoza’s thought. For while this austere intellectualism suggests the picture of the isolated, asocial thinker, devoted exclusively to the life of the mind, what is affirmed instead is the essentially social character of human existence. For Spinoza, as for Aristotle, human beings are social animals; and the life lived under the guidance of reason is, at least to some extent, a social life (see Aristotle §22). This is not because human beings are intrinsically altruistic, but rather because, as relatively limited and weak finite modes, they are ineluctably interdependent. Thus, Spinoza argues that those who live under the guidance of reason desire nothing for themselves that they do not also desire for others (*Ethics*: IV, prop. 37). This reflects his undoubtedly idealized portrait of those devoted to the life of the mind. In so far as this devotion is pure (which it can never be completely), such individuals will not come into conflict because the good which they all seek, knowledge, can be held in common. In fact, not only will genuine seekers after truth not compete, they will cooperate; for in helping others acquire knowledge and the control of the passions that goes with it, one is also helping oneself. Moreover, although only the few capable (to some extent) of living under the guidance of reason may be able to grasp adequately and, therefore, internalize this truth, the need for cooperation applies to all; for all are members of the same human community of interdependent beings.

11 Moral theory (cont.)

Spinoza’s account of the specific virtues reflect his general principles. These virtues are identified with certain affects or emotional states and their value is regarded as a function of their capacity to promote an individual’s conatus. For this purpose the affects are divided into three classes: those that are intrinsically good and can never become excessive (the virtues); those that are intrinsically bad; and a large group that are good in moderation but bad if they become excessive. In identifying the virtues with affects that can never become excessive, Spinoza differs from Aristotle for whom virtues are regarded as means between two extremes.

Paramount in the group of virtuous affects is pleasure or joy. Since it reflects in the attribute of thought an increase in the body’s power of activity, it can never be harmful. This gives Spinoza’s thought a strongly anti-ascetic tone which stands in sharp contrast to the Calvinistic austerity of many of his countryman. Nevertheless, it is crucial to distinguish between genuine pleasure, which reflects the wellbeing of the organism as a whole, and titillation

(*titillatio*) or localized pleasure, which merely reflects that of a part. Although the latter can be good, it can also be quite harmful. Other affects in this mixed category include cheerfulness and self-esteem. In the latter case, the crucial factor is whether or not the affect is grounded in reason. Pride, or self-esteem, without any rational basis is obviously harmful and is to be avoided at all costs. But, in so far as self-approval arises from an adequate idea of one's power, it is the highest thing we can hope for, since it is simply the consciousness of one's virtue. Perhaps even more than his anti-asceticism, this indicates how much closer Spinoza is to the classical ideal of the virtuous life than he is to traditional religious morality.

In addition to pain, Spinoza assigns first place among the intrinsically harmful affects to hate. Closely associated with hate, and rejected in similarly unqualified terms, are affects such as envy, derision, contempt, anger and revenge. These might be termed the social vices, since they serve to alienate human beings from one another. It is also noteworthy that Spinoza here locates many of the traditional religious virtues: hope, fear, humility, repentance and pity. Since they all reflect ignorance and lack of power, they cannot be regarded as beneficial, or assigned any place in the life of reason. Nevertheless, in a concession to human frailty, Spinoza does acknowledge that because human beings rarely live in this manner, these affects have a certain pragmatic value as checks on our more aggressive tendencies.

The affects that can be either good or bad include - besides titillation - desire and love. If directed towards an object that stimulates or gratifies a part of the organism or one of its appetites at the expense of the whole, they can become excessive and hence harmful. And this is precisely what occurs in pathological states such as avarice, ambition, gluttony and above all, lust. In spite of his generally anti-ascetic attitude, Spinoza tended to regard sexual desire as an unmitigated evil. In sharp contrast to it stands the one kind of love that can never become excessive: the love of God.

12 The love of God and human blessedness

Although it does not enter into the account of virtue, the love of God plays a central role in the final part of the *Ethics*. The situation is complicated, however, by the fact that this part deals with two distinct topics, which may be characterized as mental health and blessedness; and the love of God is crucial to both. The question of health is the subject of the first twenty propositions, which are concerned with reason's unremitting struggle with the passions. Here Spinoza functions explicitly as therapist, providing his alternative not only to the religious tradition, but also to the training of the will advocated by the Stoics and Descartes (see Stoicism). Since what is crucial is that, as far as possible, one be moved by pleasurable thoughts (rather than reactive, negative affects), Spinoza's account amounts to an essay on the power of positive thinking. Moreover, since the ultimate positive thought is the love of God, this love serves as the chief remedy against the passions.

In spite of the religious language in which it is expressed, this claim is readily understandable in Spinozistic terms. Since by 'love' is meant simply pleasure accompanied by the idea of its cause, any pleasure accompanied by God as its cause counts as the love of God. But all adequate cognition is both inherently pleasurable, since it expresses the activity of the mind, and involves the idea of God as cause, since it consists in an idea of the object as following from God (the third kind of knowledge). Thus, the adequate knowledge of anything involves the love of God as its affective dimension. Moreover, since, in principle at least, it is possible to acquire an adequate idea of any modification of substance, it follows that this love can be occasioned by virtually anything. Consequently, it is its potential ubiquity, together with its superior affective force as expression of pure activity, that qualifies this love-knowledge of God as the supreme remedy against the passions.

In the second half of part five, the love of God is now explicitly characterized as 'intellectual' and paradoxically identified with the love with which God loves himself. And if this were not puzzling enough, Spinoza introduces the new discussion by proclaiming: 'With this I have completed everything which concerns this present life… so it is now time to pass to those things which pertain to the mind's duration without relation to the body' (*Ethics*: V, prop. 20, scholium). This sets the agenda for the final propositions, the basic concern of which is to show that 'The human mind cannot be absolutely destroyed with the body, but something of it remains which is eternal' (*Ethics*: V, prop. 23). It is within this context that Spinoza refers to the intellectual love of God.

Because of their apparent incompatibility with the central teachings of the *Ethics*, these final propositions remain a source of perplexity. Nevertheless, it does seem possible to make sense of Spinoza's thought here, if we see it in

the context of a shift of focus from the concern with reason (including the love of God) in its struggle with the passions, to a concern with the life of reason as the highest condition of which human beings are capable and, therefore, as constitutive of human blessedness. So construed, the abrupt change of tone is simply Spinoza's way of marking that shift rather than an indication of a lapse into a mysticism that is totally at variance with the spirit of his philosophy. Such a reading leads to an essentially epistemological rather than a metaphysical reading of the doctrine of the eternity of the mind. According to this reading, the human mind is 'eternal' to the extent to which it is capable of grasping eternal truth and ultimately of understanding itself by the third kind of knowledge, which, in turn, leads to the intellectual love of God. To be sure, this is not the eternal life promised by religion; but it is a state of blessedness or perfection in the sense that it involves the full realization of our capacities. Moreover, it is precisely the mode of life to which the *Ethics* as a whole points the way.

Such a reading is also supported by the final proposition in which Spinoza returns to the theme of virtue and links it with both health and blessedness. As he there puts it, 'Blessedness is not the reward of virtue, but virtue itself; nor do we enjoy it because we restrain our lusts; on the contrary, because we enjoy it, we are able to constrain them' (*Ethics*: V, prop. 41). There is not a trace of mysticism here, but merely the familiar Spinozistic emphasis on the connection between blessedness and knowledge on the one hand, and knowledge and power on the other. Accordingly, the point is that we do not acquire this knowledge by first controlling our lusts, but that we have the power to control them (virtue) only to the extent to which we already possess adequate knowledge. And it is in this knowledge, also characterized as peace of mind, that blessedness consists.

13 Politics

Spinoza's concern with political theory has its philosophical roots in his conception of human beings as social animals, which entails the necessity of living in a state under a system of laws; but it was also triggered by the political situation in his own time. In the Netherlands, the monarchist party was intent on overthrowing the republican form of government, and their allies, the Reformed clergy, desired to establish a state church. In spite of his commitment to a life of philosophical contemplation, Spinoza was keenly aware of this situation and the dangers it posed to freedom of thought and expression, which he regarded as essential. His philosophical response to this threat, as well as the statement of his own views about the nature and function of the state, are to be found in the *Tractatus Theologico-politicus (Theological-Political Treatise)* and the *Tractatus Politicus (Political Treatise)*. The former is a polemical work, intended, at least in part, as a response to the Reformed clergy, while the latter is a dispassionate essay in political science. But despite this difference in tone and some disagreement on substantive matters, both works argue for freedom as the supreme political value and both investigate the conditions under which it can be realized and preserved.

Spinoza's political thought is best approached by way of a comparison with Hobbes. Both thinkers view human beings as thoroughly determined parts of nature and as driven by the desire for self-preservation; both are amoralists in the sense that they hold that everyone has a 'natural right' to do whatever is deemed necessary for self-preservation; as a direct consequence of this view of natural right, both view the state of nature (the pre-political condition) as one of unavoidable conflict and insecurity; and, finally, both maintain that peace and security can be attained only if everyone surrenders all of their natural right to a sovereign power (which takes the form of a social contract). But whereas Hobbes concludes from his account the necessity of an absolute sovereign power, preferably in the form of a monarchy, Spinoza infers from substantially the same premises that the true end of the state is freedom, and, at least in the *Theological-Political Treatise*, that democracy is 'the most natural form of state'.

To some extent, these differences can be understood in terms of the different social and political conditions under which the two thinkers lived. There are also important philosophical differences, however, one of which is their respective conceptions of human reason. For Hobbes, reason has a merely instrumental value as a means to the attainment of ends dictated by desire. We have seen, however, that for Spinoza the goal is to transform desire through reason, which naturally leads him to focus on the conditions under which the life of reason can best be lived. Moreover, Spinoza seems to have arrived at his conclusions through a kind of internal critique of Hobbes. As he informed a correspondent in 1674:

> With regard to politics, the difference between Hobbes and me… consists in this, that I ever preserve the natural right intact so that the supreme power in a state has no more right over a subject than is proportionate to

> the power by which it is superior to the subject. This is what always takes place in the state of nature.
> (Spinoza 1966 letter 50: 269)

By suggesting that Hobbes did not keep natural right intact, Spinoza is implying that he did not consistently equate right with power. This is indeed true; but it does not explain how the identification of might with right enables Spinoza to arrive at his conclusions. The gist of the answer, as suggested by this passage, is that the identification applies also to sovereign power. In other words, rather than gaining absolute right over its subjects through the social contract, as Hobbes maintained, the sovereign's right is limited by its power; and since this power is inevitably limited, so too are the things that a sovereign may 'legitimately' demand of its subjects.

Among the things that a sovereign cannot require are acts so contrary to human nature that no threat or promise could lead a person to perform them. These include things such as forcing people to testify against themselves or to make no effort to avoid death. But Spinoza does not stop at such obvious cases. He also emphasizes the limitation of legislative power with respect to private morality; and he finds an argument for freedom of thought in the fact that a government is powerless to prevent it. More importantly, he points out that there are some things which a government can do by brute force, but in doing so inevitably undermines its own authority. And since a government cannot do these things with impunity, it does not have the 'right' to do them at all. Thus, he argues on entirely pragmatic grounds for the limitation of governmental power through the power of public opinion.

Spinoza's main concern as political theorist, however, is not to determine what the state cannot do, but rather what it should do in order to realize the end for which it was established. Moreover, while verbally agreeing with Hobbes in construing this end as peace and security, Spinoza understands these in a much broader sense. Accordingly, peace is not merely an absence of war or the threat thereof, but a positive condition in which people can exercise their virtue. Thus, the goal of the state is to create this condition, which is also the social condition necessary for the life of reason as depicted in the *Ethics*.

But the life of reason is only for the few, and political arrangements must concern the many. Moreover, since it is the many who determine the public opinion to which the government must pay heed if it is to rule effectively, it follows that there can be valid laws, approved at least tacitly by a majority, which are none the less inimical to true virtue. Spinoza was keenly aware of this problem; but his way of dealing with it indicates the tension between his democratic tendencies and his elitism that runs throughout his theory. Thus on the one hand he insists on the right of free expression, including the right to protest against laws deemed unjust, while on the other hand he emphasizes the necessity of total obedience to the existing law, no matter how contrary to reason it may be. The reason for this conservative turn, which is also reflected in the complete rejection of revolution as a political remedy, lies in his profound sense of the irrationality of the multitude. Given this irrationality, which poses a constant threat to the power of reason, Spinoza concludes with Hobbes that even under a tyrannical regime, obedience to the established authority is the lesser evil.

14 Scripture

Spinoza's revolutionary treatment of the Bible in the *Theological-Political Treatise* must also be understood within the framework of his political thought. In line with his concern to secure the freedom to philosophize, he launches a systematic attack on the authority of Scripture: its claim to be the revealed word of God. But rather than offering an external philosophical critique in the manner of the *Ethics*, he attempts, in a somewhat paradoxical fashion, to show from Scripture itself that it makes no such claim to authority. This strategy, in turn, rests on a new method of Biblical exegesis, one based on the Cartesian principle that nothing should be attributed to the text that is not clearly and distinctly perceived to be contained in it. In light of this principle, he rejects both the Calvinist doctrine that a supernatural faculty is required for interpreting the Bible and the older Jewish rationalism of Maimonides, which held that if the literal reading of a passage conflicts with reason, it must be interpreted in some metaphorical sense (see Maimonides, M.). Both of these approaches he regards as not only useless for interpreting the Bible, but as dangerous politically, since they lead to the establishment of spiritual authorities.

Applying his method, Spinoza argues that neither prophecy nor miracles, the twin pillars of biblical authority, are able to support the orthodox claims. The prophets are shown to differ from other individuals in their superior imaginations, not in their intellects. Similarly, biblical miracles are treated as natural occurrences, which only appeared mysterious to the biblical authors because of their limited understandings and, as such, have no probative

value. More generally, the Bible is viewed as a document which reflects the limited understandings of a crude people rather than the dictates of an omniscient deity. And by analysing Scripture in this way, Spinoza laid the foundation for the subsequent historical study of the Bible (‘higher criticism’), which endeavours to interpret it by the same methods applicable to any other ancient text.

Spinoza’s critique of the Bible is, however, largely directed against its speculative content and claim to be a source of theoretical truth. Thus, he affirms that in moral matters the Bible has a consistent and true teaching, which reduces essentially to the requirement to love one’s neighbour. Moreover, precisely because it appeals to the imagination rather than the intellect, it has the great virtue of presenting morality in a form which the multitude can grasp. Such a view of religion as morality for the masses is hardly original to Spinoza. It had already been expressed in the twelfth century by Averroes (see Ibn Rushd §4), and it found expression in many subsequent politically minded thinkers, including Machiavelli (see Machiavelli, N. §6). But, if not original to Spinoza, it is still an integral part of his political thought, since it enables him to ‘save’ religion while also protecting the autonomy of philosophy. And the latter is, of course, necessary for the life of reason as depicted in the *Ethics*.

Split brains

Severing the direct neural connections between the two cerebral hemispheres produces a 'split brain'. Does it also multiply minds? The most extensive tests of the psychological results of this operation were conducted by Roger Sperry and his colleagues. He concluded that split-brain patients have 'Two separate spheres of conscious awareness, two separate conscious entities or minds, running in parallel in the same cranium, each with its own sensations, cognitive processes, learning processes, memories and so on'. Sperry's view faces both conservative and radical challenges. The conservative challenge is that the results of the tests do not imply that split-brain patients have two minds and are two persons. The radical challenge is that the operation does not multiply minds but, instead, reveals a startling fact: human beings with intact commissures already have two spheres of consciousness, house two minds, and are two persons.

For the purposes of this entry, a split-brain patient is one who has had a *complete* forebrain commissurotomy. In this operation (which has been replaced by less radical procedures), the *corpus callosum* and the other neural links ('commissures') between the two cerebral hemispheres were completely severed.

Patients underwent the operation for the relief of otherwise uncontrollable epilepsy, and it was considered a therapeutic success. Epileptic attacks disappeared, became less frequent or were confined to one hemisphere. Once the patients recovered from the operation, they were able to resume their normal lives; people who knew these patients before the operation would not notice any dramatic changes in their personality, intellect or everyday behaviour.

Observation under controlled conditions discloses a different picture. When input is limited to one cerebral hemisphere and response demanded of it, the behaviour of split-brain patients is decidedly abnormal, as the following simple example illustrates. 'Key ring' is flashed on a screen for a tenth of a second so that 'key' appears in the left visual field and 'ring' in the right. If split-brain subjects are asked to *say* what they saw, they respond that they saw 'ring' and show no sign of seeing 'key'. But, if they are asked, instead, to *retrieve* with their left hands the object named on the screen from an array of items concealed from sight, they will pick out a key while rejecting a ring. Asked to point with the left hand to the object named on the screen, they point to a key or a picture of a key and not to a ring or a picture of a ring. If they are allowed to use both hands to pick out the object named from an array of items hidden from sight, their left and right hands work independently, the right settling on a ring while rejecting a key and the left doing the opposite. Someone seems to have seen 'key'. Someone else seems to have seen 'ring'. No one seems to have seen 'key ring'. With suitable controls, input from the other sensory modalities, except taste, can also be confined exclusively to one hemisphere. When a response depends upon it, split-brain patients behave in similar abnormal ways.

The standard explanation of such behaviour is roughly as follows. The structure of the visual system assures that the left half of the field of vision is conveyed to the right hemisphere and vice versa. Normally, information about the contralateral visual field is supplied to each hemisphere by neural communication across the commissures and by subsequent eye movement. Since the commissures of split-brain patients are severed and the short exposure time serves as a control for eye movement, their right hemispheres see only the word 'key' and their left only the word 'ring'. In most people, speech production is localized in the left hemisphere; and so the oral response to the question reports only what the left hemisphere saw: the word 'ring'. The left hand is primarily controlled by the right hemisphere; so it retrieves the object the right hemisphere saw named - a key - and points to a key or a picture of a key. (Notice that this explanation presupposes speech comprehension in the mute right hemisphere.) Similarly, the right hand is primarily controlled by the left hemisphere, thus accounting for the independent search of items concealed from sight. The failure to elicit any response suggesting that 'key ring' was seen is that the contents of the visual field available to each hemisphere are not the same and, because of the severing of the commissures and the experimental controls, not communicated to the opposite hemisphere.

Behaviour of the sort illustrated in the 'key ring' example and its explanation fuel a natural, tantalizing line of inference.

(1) *The behaviour shows that the split-brain patient sometimes has a disunified consciousness.* No one has doubted that the behaviour associated with the left hemisphere in the 'key ring' example indicates that the subject

consciously saw ‘ring’. The behaviour associated with the right hemisphere seems to be equally clear and prototypical evidence that the subject has a conscious experience of seeing ‘key’; in fact, it is difficult to see how this can be denied short of a general scepticism about the consciousness of human beings who can comprehend, but not produce, language. So, in the example, the patient has simultaneous conscious experiences of seeing ‘key’ and of seeing ‘ring’, but none of seeing both.
(2) *This disunity of consciousness is a standing condition.* The cause of the disunity of consciousness, behaviourally evident in the ‘key ring’ example, is the severing of the neural connections between the two cerebral hemispheres. These remain severed and their neural functions unduplicated whatever the behaviour of split-brain patients. In the absence of controls to prevent it, the separate spheres of consciousness associated with the left and right hemispheres have highly similar contents. This overlap of content and other factors explain why the split-brain patient’s everyday behaviour does not dramatically display two separate spheres of consciousness.
(3) *Split-brain patients have two minds and are two persons.* Despite the significant differences between the two hemispheres, each sustains a range and complexity of psychological functions, including self-awareness, that is characteristically human. Examinations of hemispherectomy patients and their near functional kin - patients with severe strokes in a single hemisphere - confirm the observations of split-brain patients. Neither hemisphere has any better access to the conscious contents of the other than we do to those of other people; each has as direct access to its own experiences as we do to ours. So split-brain patients have two minds. If an embodied mind of characteristic human complexity is a person, then the split-brain patient is two persons since the patient embodies two of them.
(4) *If split-brain patients have two minds and are two persons, so do human beings with intact commissures.* Even with commissures intact, each hemisphere receives a separate neural representation of ‘key’ and ‘ring’ in conditions like the ‘key ring’ example. Why, then, do we not see the behaviour of a split-brain patient? The usual answer is that neural communication between the hemispheres ensures that the right hemisphere is made aware that the left is seeing ‘ring’ and, perhaps, brought to have such an experience itself and vice versa for the right hemisphere. But, then, we have a duplicate of the split-brain case. Communication between the two hemispheres provides a behavioural mask of two independent streams of consciousness - two minds - and two persons just as the duplication of content in everyday circumstances does in the split-brain patients. So, starting from incontestable neurological and behavioural facts about split-brain patients, one apparently arrives at the paradoxical conclusion that we are small collectives of two minds and two persons (see Mind, bundle theory of; Personal identity).

The line of inference just sketched can be used to define philosophical positions on split brains. For a variety of reasons, conservative challenges to Sperry (see above) hold that it should stop short of its third step. Eccles (1970) once claimed that there are no conscious mental phenomena known to be associated with the nonverbal right hemisphere and, later, that whatever conscious processes might be associated with it are subhuman in character. Others have argued that the disunity in consciousness split-brain patients sometimes exhibit is not a standing condition and does not imply two minds; yet others that, although split-brain patients have two minds, they constitute a single person because a single control structure governs both. Sperry (1968) has consistently held the middle ground, endorsing the line of inference as far as its third step. He has refused to join Bogen (1985) and Puccetti (1973) in taking the radical fourth step because, he claims, intact cerebral commissures are the physical basis of unity of consciousness and mind. Many other positions have been taken besides those mentioned. Thomas Nagel’s is particularly striking. He claims that there is no answer to the question of how many minds or persons split-brain patients contain, and that this shows that our ordinary concept of the unity of a person ‘may resist the sort of coordination with the understanding of humans as physical systems, that would be necessary to anything describable as an understanding of the physical basis of mind’ (1971).

The wide diversity of opinion has several sources. The data are unexpected and sometimes messy. Any attempt to deal with them faces a special version of the mind-body problem. One must decide, on some principled grounds, the relation of various anatomic, neurological and behavioural data to mentalistic descriptions; and the proper account of the mentalistic notions of prime concern - consciousness, mind and person - is, to put it mildly, controversial. We also still lack a detailed understanding of how brain structures are responsible for the psychological distinctions involved, for example, what specific role the *corpus callosum* plays, what a control structure is, and how to count centres of consciousness.

Besides raising the philosophical issues discussed above, research on split brains has provided much insight into

problems of deep physiological and psychological interest, for example, hemispheric specialization, which are not immediately tied to them. It has also provided a launching pad for a variety of 'thought experiments' in philosophical discussions of personal identity.

Sport and ethics

Ethical controversies have formed some of the liveliest debate in the philosophy of sport. Some of the issues arise out of the very nature of sport as a rule-governed activity, especially since the breaking of those rules often presents opportunities for competitive advantage. Other debates concern over-emphasis on winning, which can lead to various forms of cheating. The 'problem of winning' is clearly related to the larger problem of competition itself, which has led to lively dialogue over whether competition in athletics inevitably causes alienation. Finally, one of the most provocative controversies has been over the question of performance-enhancing drugs and whether they should be banned.

1 Sport as rule-governed activity

The French writer, Albert Camus, once wrote that it was from his youthful involvement in sport that he 'learned everything he knew about ethics'. Whatever Camus meant by this cryptic remark, it is clear that ethical issues in sport have become one of the central concerns of the philosophy of sport. In part, this may be because in sport our ethical commitments are not merely articulated in speech; we *see* an athlete's ethical standards exhibited in the way they play.

Although some sporting activities such as jogging or recreational skiing, would seem to have few explicit rules, most are rule-governed to one extent or another. Adherence to these rules becomes an immediate ethical issue, especially since often an apparent advantage can be gained by cheating. Many sport philosophers have argued that since playing a given game can virtually be defined as adhering to its rules ('playing basketball' means conforming to the rules of basketball), someone who breaks those rules is not really playing that game at all.

This is complicated by the fact that in many sports certain instances of breaking the rules are so common that they are regarded as 'part of the game'. Consider personal fouls in basketball, offsides in football or soccer, or hitting a batter in baseball. Would we want to say that a soccer player who moves offside is not playing the game? This raises the yet further issue of certain strategies that involve unconcealed breaking of the rules. Consider, for example, 'taking a foul' in basketball when an opposing player has an easy shot. Is this cheating or smart strategy? If cheating, is the fouler still playing basketball? These and related issues are given perhaps the most thorough discussion in Warren Fraleigh (1984).

2 The problem of winning

Since all competitive sports entail that one person or team will win, the other lose, how could there be a 'problem' with winning? The obvious but troublesome answer is that the competitive drive to win has led many to take illicit steps in that pursuit. The 'overemphasis on winning' has been cited as the cause of everything from cheating within the game to unfair or even illicit steps to prepare for winning, such as recruiting violations, accepting unqualified athletes into college and the use of performance-enhancing drugs.

Public debate on this issue has tended towards two simplistic responses, encapsulated in the well-known maxims, 'Winning isn't everything, it's the only thing', and its contrary, 'It's not whether you win or lose but how you play the game'. The first assumes that there are no values or goals in competitive sport other than winning, which is clearly false. Though winning is *a* goal of every game, so also are such things as getting a good workout, having fun, and developing a sense of teamwork. On the other hand, no committed athlete will be satisfied with the second maxim, which implies that winning simply does not matter. Of course it does; every athlete feels exhilaration at victory and disappointment at defeat. The real issue is to recognize winning as *one* of the values in sport, but one among others, and to put it in proper perspective alongside the other legitimate values of participation. How to do that, of course, is a complicated issue.

3 Competition

The overemphasis on winning discussed above is evidently a function of the competitive nature of sport and the abuses competition can generate. Not surprisingly, there has been much criticism of competitive sport on these grounds, deriving often from Marxian criticisms of competition in capitalism. A central contention here is that competition, whether in the economic sphere or in sport, *causes* alienation in its various guises (see Market, ethics

of §3). No one can deny that too often in sport the competitive situation devolves into alienation. Every athlete has experienced alienation in sport, and it is an easy inference that such alienation is a function of the competition central to sporting games. On the other hand, not all competitive sporting events involve alienation; indeed, the vast majority of athletic games occur among friends and are occasions of friendship. So if many or even most athletic contests are friendly, it is hardly obvious that competition *per se* causes alienation.

Part of the problem may be that we tend to think of the paradigms of sport in terms of *professional* sport, where the aspirations of the players are complicated (some would say polluted) by financial factors. Although it is neither the case that all amateur sporting events are friendly, nor all professional ones alienated, it is nevertheless plausible - and compatible with the Marxian analysis - that once sport becomes an economic issue the likelihood of alienation is increased.

One way to think about this is to consider a teleological account of competitive sport. What is sport like when it ‘really works’, when it is the best that it can be? It has been argued that, at its best, sport is indeed an occasion of friendship, that competitive sport can offer a particularly intense encounter among friendly participants who wish to challenge each other to be the best that they can be. On this view, when competitive events do degenerate into alienation, that should be construed as a defective mode of sport, certainly not as ‘the way competition is’ or the way sport has to be. That should lead in turn to efforts to determine what causes competitive sport to devolve into alienation and how to avoid those conditions.

4 Performance-enhancing drugs

One of the major ethical controversies in sport philosophy involves the use by athletes of so-called performance-enhancing drugs, the best known of which are probably anabolic steroids. The claim and the belief of many athletes is that high doses of these drugs coupled with strenuous training will build significant muscle mass and therefore enhance the athlete’s abilities. There is some evidence, however, that such drugs, particularly in the doses employed by some athletes, are harmful to one’s physical and mental health, resulting in everything from acne and danger of cancer to pathological aggressiveness. This has led most sports organizations to ban the use of performance-enhancing drugs.

But should they be banned? This has become the subject of considerable controversy. Most writers have argued that they ought to be banned on several grounds. The main objections to their use have been danger to health, the issue of fairness, and the problem of coercion.

The danger-to-health argument hinges on the validity of the data suggesting that these drugs are indeed dangerous to health, and a certain commitment to paternalism, arguing that since such drugs are dangerous, athletes should be ‘protected from themselves’ by having the drugs banned (see Paternalism). The fairness argument turns on the clear sense that those athletes who do choose to use performance-enhancers, even at the risk of their health, will have an unfair advantage over those presumably more prudent athletes who choose not to use them. This leads in turn to the third argument, that athletes who wish to excel will be unfairly coerced into using the drugs if they want to compete with drug users.

All these arguments have been contested in a set of important and provocative articles by W.M. Brown (1980, 1984). Brown begins by pointing out the difficulty of determining nonarbitrarily just what a performance-enhancing drug is. What about aspirin for pains before a game? What about caffeine for stimulation? Do they not enhance performance? With regard to the presumed danger to health, Brown argues that even if it is shown conclusively that, say, anabolic steroids do constitute a health danger (in fact a disputed point), the very activities of most sports involve dangers to health much more severe than the putative dangers of performance-enhancers: various injuries and even, as in the case of sports such as rock climbing or automobile racing, risk of death. If ‘danger to health’ is a criterion for banning, it appears most sports should be banned.

Turning to the fairness argument, Brown rejoins that there are all sorts of unfairness inherent in most sports. Is it not ‘unfair’ to me as a normal sized male if my opponent in basketball is seven feet tall? Is it not ‘unfair’ if my cross-country ski opponent grew up in snowy Vermont while I grew up in Florida? Is it not ‘unfair’ of my opponent to practice for long hours or lift weights to gain an advantage when I do not? How, in short, do we separate nonarbitrarily the unfairness of performance-enhancing drugs from the myriad other unfairnesses that competitive sport entails?

Regarding the coercion argument, Brown retorts that the use of the term ‘coercion’ here is overblown. ‘No one forces athletes to seek Olympic gold,’ he says; the pressures on athletes to take performance-enhancing drugs are no different in principle from all the other pressures - and difficult decisions - that top level athletes face all the time. The debate continues.

Sport, philosophy of

The philosophy of sport as a separate area of philosophy is largely a phenomenon of the second half of the twentieth century, although previous philosophers, back to the ancient Greeks, occasionally made reference to sport or used it as an example in a larger point. Within the philosophy of sport, a number of sub-areas have emerged as important: sport and ethics, questions concerning sport and society, the issue of self-knowledge in sport, the mind-body problem as it relates to sport, sport and art, and the controversy over the possibility of defining certain key terms within sport, such as sport, game, play and athletics.

Within the area of sport and society, several major debates have arisen. The first is about whether sport teaches values and, if so, whether the values taught are desirable or not. Second, considerable attention has been paid to how certain societal problems, such as sexism and racism, have manifested themselves in sport, and how they might be addressed within sport. Third, attention has been directed to the phenomenon of the athlete as cultural hero.

The relevance to sport of the age-old philosophical issue of self-knowledge is manifest, with a number of different construals of what counts as self-knowledge emerging as important. Attention has been paid to self-knowledge in the psychological sense, self-knowledge as manifested in Zen thought and self-knowledge in the Socratic sense, among others. The mind-body problem, also an old philosophic issue, has clear relevance within the domain of sport. Dualism, physicalism and phenomenological accounts have all been represented, the latter being the most dominant and persuasive so far.

1 Introduction: historical background

The history of the philosophic interest in sport in one sense goes back to the ancient Greeks, but in another sense is a phenomenon of the middle and late twentieth century. Greek culture in general placed great emphasis on what they called *gymnastikē*, the training of the body, making it, along with education in the arts (*mousikē*), one of the two foundations of education. Plato, in Books III-V of his *Republic*, reflects this interest by making education in gymnastics a core aspect of the education of those who will become the famous ‘philosopher-rulers’, and in his *Laws* (803c), the Athenian Stranger praises play as the very highest of human activities. In addition, Aristotle sometimes uses examples from athletics to make important points. Nevertheless, no Platonic dialogue, Aristotelian treatise or other philosophic work in ancient Greece focused explicitly on sport as a topic worthy of philosophic reflection in its own right.

This situation remained almost until the middle of the twentieth century. Indeed, for long periods of time, there was very little mention of sport or athletics by philosophers at all. In the late eighteenth and the nineteenth centuries, philosophers such as Schiller and Nietzsche praised play as a high human activity, and Nietzsche made it a guiding metaphor for his notion of the purposeless ‘happening’ of the will to power. Following him in the twentieth century, continental thinkers such as Heidegger, Gadamer, Foucault and Derrida used play as a metaphor for their guiding notions, and Wittgenstein used the concept of ‘language games’ as a core notion in his philosophy, but none of them treat sport as a philosophical theme in itself.

In 1938, however, the historian Johan Huizinga published his book *Homo Ludens: A Study of the Play Element in Culture* in which he argued the thesis that ‘civilization arises and unfolds as play’. Part of the importance of this book was that it legitimized play and sport as respectable topics for intellectual reflection and research. A few decades later, the US philosopher Paul Weiss published his *Sport: A Philosophic Inquiry* (1969), after which sport became a legitimate and identifiable area of philosophic investigation.

We shall discuss a number of the most important topics and issues in the philosophy of sport. Some of the most important topics not treated below at least deserve mention. We shall not here address the crucial connection between sport and ethics (see Sport and ethics). There is also a lively discussion in the philosophical literature concerning the definition of key terms in philosophy of sport. Can terms such as game, play, sport and athletics be defined? Or, in a Wittgensteinian mode, can we at best find a number of ‘family resemblances’ in and among these terms? Probably the most important single contribution to this debate has been Bernard Suits’ 1978 work *The Grasshopper: Games, Life, and Utopia*, a book-length study devoted to the thesis that ‘game’ can indeed be

defined. There is also an active discussion regarding the connection of sport and art, ranging from thinkers who virtually identify the two to those whose interest focuses on the aesthetic element in sport.

2 Sport and society

Huizinga established beyond doubt that sport is essentially a cultural phenomenon. Not surprisingly, many striking philosophical issues concerning sport centre upon the relation between sport and society. One crucial issue of controversy concerns the relation of sport and the teaching or inculcating of 'values'. Nearly everyone, from the most fanatical devotees of sport to its harshest critics, agrees that sport teaches values. The disagreement is over what values sport teaches. The litany that the partisans of sport offer is well known: sport teaches such virtues as self-discipline, teamwork, being a gracious winner and a fair loser, fair play and courage. The critics of sport are no less sure that sport teaches values: mindless obedience to authority, the desire to hurt or humiliate others, dog-eat-dog competitiveness, cheating and a willingness to ruin one's body in the name of winning a game.

A look at the empirical evidence attests that both are sometimes right. Depending on the situation, on the coaches and the players involved, sport can probably help inculcate the most desirable or the most deplorable qualities. The issue, much more complex, is how to structure our athletic situations so that the desirable qualities are encouraged and the deplorable ones resisted.

It is usually assumed that the values inculcated, whether positive or negative, derive originally from society. This raises the subsidiary and subtle question of whether there are any values or qualities genuinely peculiar to sport that could be productively redirected into the larger culture. Nevertheless, most of the values, it is assumed, come from society into sport. Two of the most problematic in this regard are racism and sexism, about which there is a lively literature in sport philosophy.

No one argues that sport is inherently racist. The racism that has long infected sport, it is plausibly assumed, is a reflection of the racism in society where it originates. And indeed, the history of racism in sport has closely paralleled that of society, from formal segregation early on, to the introduction of 'token' numbers of blacks in college and professional sports teams, to various 'quotas', explicit or implicit. In recent years, as blacks have come to dominate many of the most popular US sports, the issue of racism has taken on a different form. One of the early 'justifications' often offered for the segregation of blacks into their own leagues was that it was 'for their own good', that they were naturally inferior athletes who would only be humiliated by a direct comparison in competition with whites. As blacks were gradually integrated into sporting life, and especially as they began to be remarkably successful, the argument quickly reversed itself, but ironically, in order to serve the same racist ends. Blacks, it was suggested, are 'naturally superior athletes', only a few generations away from the primitive conditions of the jungle. The easy inference drawn from this claim is that because blacks' superior athletic ability is 'natural', it is not a consequence of the hard work, discipline, and perseverance attributed to whites who exhibit athletic ability. Whites get good by exhibiting hard work and other virtues. Blacks just do it 'naturally'. A second consequence often drawn was that the natural physical superiority of black athletes was matched by a corresponding intellectual superiority of whites. White players are 'smart', 'heady', 'know the game'. Blacks, by implication, lack the intelligence of white athletes.

Still, something calls for explanation here. Blacks have been enormously successful at athletics in proportion to their representation in society at large. Two basic explanations have been offered, one much more controversial than the other. The first, less controversial one emphasizes environmental factors. Perhaps the generally greater poverty of blacks has made them tend to be more competitive. Perhaps their exclusion from more common pursuits (business careers, law, medicine and so on) leads the most talented of them to focus their youthful energies on athletics. All such explanations make the athletic success of blacks not a function of inherent or natural differences but of social environment. And social environment can be changed.

The second, more controversial explanation argues that there are genetic or at least physiological differences between blacks and whites that explain blacks' athletic prowess. Claims have been made that blacks tend to have more fast-twitch muscles, that their muscle-to-fat ratio is superior to that of whites, or that their physiology tends towards longer limbs that enhance athletic ability. These claims are controversial on two grounds. First, the empirical evidence is highly disputed. Many of the 'experiments' conducted are replete with uncontrolled variables that make the results highly suspect. It is even doubted by many biologists whether the very concept of

‘race’ is a viable biological category. Second, claims regarding ‘natural’ differences are controversial in that claims of just this sort have long been used in the service of racism; blacks are ‘just different’, we have long been told, and ‘different’ too often implies ‘inferior’ (see Race, theories of).

The case of women’s participation in sport has in some ways paralleled the case of blacks. For all too long, women were virtually excluded from participation. Gradually, especially with the passage in the 1970s in the US of Title IX legislation demanding equal opportunity in sports for women, they began to have more opportunities to play sports and, accordingly, began to play in much greater numbers. Still, the perception remains widespread that because of physiological differences affecting speed, size and strength, women are inevitably inferior athletes to men.

Again the ‘nature versus nurture’ argument becomes germane. Is the gap both in participation and relative abilities largely explicable by appeal to the greater opportunities given to young male athletes and the greater encouragement given to them to compete athletically? Or do the physiological differences remain fundamental, and is the statistically significant extent to which men are stronger, faster and bigger than women a function of natural physiological differences?

Even if the latter argument is accepted, an important qualification must be admitted. The physiological differences may be natural, but the sports are invented. And most sports have been invented by men, in ways that highlight precisely those qualities - speed, size, strength - typically characteristic of male physiology. Suppose we used other criteria, perhaps balance and grace, as the criteria for determining athletic superiority. Suppose, for example, we used as a test of athletic ability one of the very few sports designed explicitly to highlight qualities exhibited paradigmatically by women: the balance beam in gymnastics. If we did, we would discover that women were by far superior ‘natural athletes’ to men (see Feminism §5).

A final issue regarding sports and society that has caused considerable controversy concerns the widespread tendency in contemporary culture to raise outstanding athletes to the status of cultural heroes. A culture’s heroes are often informative of the culture’s needs and values. What does the widespread elevation of athletes to the status of cultural heroes suggest about contemporary culture? It might suggest a nostalgia for the past. Physical prowess such as that exhibited by athletes, after all, is increasingly unnecessary in a culture dominated by technological developments that render physical strength, speed or size largely irrelevant. Or, to put a different slant on the same point, is our worship of athletes as heroes part of an effort to preserve the value of a set of characteristics - physical abilities exhibited by athletes - that we recognize are in danger of being lost? Or, finally, is the phenomenon of athletes as heroes an indication of a higher culture, one that raises to high status a set of activities of relatively little practical worth precisely because they are not merely practical? In any case, the elevation to hero status of athletes, especially since those outstanding athletes do not always exhibit the personal and moral qualities we desire, remains a controversial question in the philosophy of sport.

3 Sport and self-knowledge

‘Know thyself’ has been a core goal of philosophy since before Socrates. A claim is often made that athletic involvement, at least of the right kind, can lead to genuine self-knowledge. But what kind of self-knowledge? Several different senses of self-knowledge have received attention in the philosophy of sport. First is self-knowledge in a roughly psychoanalytic sense. The psychiatrist Arnold Beisser, in his book *The Madness in Sports* (1977), analyses troubled athletes and relates their choice of sport or their mode of involvement in sports to their respective pathologies. But implicit in his analysis is the inference that any athlete, pathologically troubled or not, can gain this sort of self-knowledge through reflection on their involvement in sport. A number of psychological categories come quickly to mind as clearly applicable.

Consider, for example, the social significance of one’s choice of sport. Suppose one is from an impoverished social background, and one’s favourite sports are golf, polo and squash. Does that suggest a desperate attempt to deny one’s social status, or a healthy refusal to be limited by it? Or suppose one is from a wealthy background and one chooses the same sports. Does that suggest an inability to escape from the social expectations of one’s class or a healthy acceptance of it? Note in each case that the issue itself does not supply the answer. Rather, it enables one to formulate the potentially fruitful question, which must be answered in each case individually.

There are numerous other categories of analysis that might prove fruitful. Consider the issue of team sports versus

individual sports. What does it suggest about oneself if one's preference is predominantly for one or the other? Or again, take the difference between competitive and non-competitive sports. Many people love to jog, swim or ski, but would never consider doing so competitively. Others get bored unless the activity can be transformed into a competitive game. Either way, reflection on one's choices might be psychologically revealing. Other sets of contrasts can be no less revealing: contact or non-contact sports; coeducational or single-sex sports; spectator sports or non-spectator sports and so on.

One's mode of involvement in sports can also be psychologically revealing. Certain people are notoriously poor losers or gracious winners, who 'come through in the clutch' or, to the contrary, 'fold' in key situations. Others are peculiarly injury-prone, or play well only when alienated from the opposition. All such phenomena can be occasions for self-knowledge.

But self-knowledge in the psychological sense is hardly the only sense of self-knowledge available in sport. A second construal that has gained considerable popularity in sport philosophy involves a convergence of the notion of 'peak experiences' popularized by Irving Mazlow and certain aspects of Zen Buddhist theory. The notion of a peak experience, originally conceived in terms of certain profound experiences such as love, friendship, or religious revelation, found a receptive audience among talented athletes. After long periods of preparation, these occasionally experience moments when a technically difficult activity, say shooting a basketball, hitting a baseball or skiing a steep slope, seems suddenly to happen easily, smoothly and without effort or analytic thought. Such experiences seem related to aspects of Zen Buddhist experience, especially as that has been applied to athletic activity. The key figure in the popularization of this notion is Eugen Herrigel, whose book, *Zen in the Art of Archery* (1953), set the stage for a host of other books applying the themes of Zen Buddhism to other sports. The key notion here seems to be that the 'self' in the sense of the ego or egoistic self must be 'let go', left behind in favour of a more profound experience of immersion that no longer separates the egoistic self from the experience in which it is involved.

Finally, considerable attention has been paid to self-knowledge in roughly the Socratic sense of 'knowing what I know and what I do not know'. In the sporting domain, this has been translated into something like 'knowing what I can do and cannot do', and this in turn has two dimensions. First, this sense of self-knowledge entails recognizing one's limits and staying within them, 'playing within oneself', as coaches sometimes exhort. But second, it also entails taking oneself to the limits of one's ability, doing everything that one can do. To the extent that an athlete fulfils both of these goals implicit in the Socratic sense of self-knowledge, they will be likely to attain the peak of athletic prowess.

4 Mind and body in sport

Most sporting activity is a consummate example of the conjoining of mental and physical activity. As such, it is a rich testing ground for one of the oldest of philosophical problems, the connection of physical and mental activity or, as it is sometimes expressed, 'the mind-body problem'. Three basic views have received some attention in the philosophy of sport literature. The first is the age-old position of the so-called dualism of mind and body. This view has mostly been criticized in philosophy of sport, often because the notion of somehow being two substantial entities (soul and body or mind and body) that mysteriously interact together is so far from the actual experience of most athletes. Second is the materialist or physicalist view, which has also received relatively little support among philosophers of sport, in part because of the standard reductionist criticisms, but probably more because it does not succeed, at least so far, in taking adequate account of the many experiential factors in sport. For this reason, the dominant and most well-received view has been the phenomenological approach that attempts to give an adequate description of the structures of the athletic experience *as experienced*, which is the main interest of most athletes and sport philosophers.

Staël-Holstein, Anne-Louise-Germaine, Mme de (1766-1817)

Staël was a French woman of letters, whose corpus includes novels, plays, memoirs, criticism and works of historical and sociological observation. As a novelist and critic, Staël is perhaps best known as a forerunner of the Romantic movement in French literature, and for her typology of European culture. However, her extensive body of work also included a perfectibilist philosophy of history; an account of German character and literature containing an influential survey of contemporary philosophy; and a liberal defence of the French Revolution, in which Staël had been an active participant.

Staël was born in Paris on 22 April 1766, the daughter of Jacques Necker, the Genevan chief minister of Louis XVI. She supplemented an emotionally unrewarding marriage to Baron de Staël-Holstein, the Swedish ambassador in Paris, with a number of (often distinguished) lovers, and, in 1816, secretly married a Genevan soldier, John Rocca. Her salon became an important centre of intellectual and political activity, and her extensive entourage included the liberal writer and politician, Benjamin Constant; the economist and historian, Sismonde de Sismondi; and the scholar and translator, August Wilhelm von Schlegel. She welcomed the French Revolution, despite feelings of loyalty to the fallen monarchy and an attachment to a tradition of aristocratic liberty. A moderate republican emphasizing respect for the rule of law, Staël retreated to Coppet (the family château on Lake Geneva) ahead of the September massacres (1792). She travelled to England, returning to France in 1795. She supported the Directory and initially welcomed the Consulate, as instruments of social and political stability. However, her growing opposition to Napoleon eventually resulted in exile. From Coppet, she visited Germany and Italy, before, in 1812, fleeing Napoleonic Europe and making her way (through Austria, Russia, Finland and Sweden) to England. After the Bourbon Restoration, to which she became reconciled, Staël, ravaged by opium, returned to Paris, where she died on 14 July 1817.

Staël's nonfiction writings include studies of Rousseau, suicide, and the role of the passions, but her most important works are *De la littérature considérée dans ses rapports avec les institutions sociales (On Literature Considered in its Relation to Social Institutions)* (1800), *De l'Allemagne (On Germany)* (1810) and *Considérations sur les principaux événments de la Révolution (Considerations on the Principal Events of the French Revolution)* (1818).

In *De la littérature*, Staël propounded the claim that literature (expansively defined) reflects the historical influence of social institutions, laws and mores. The book includes digressions on a range of political and philosophical topics, as well as tracing the development of literature from the ancient world to the present. Staël advanced a perfectibilist view of historical development as exemplifying the progressive development of human faculties (promoting the medieval over the ancient world), and suggestively contrasted two 'completely distinct' European cultures, the light and elegant literature of the 'South' and the meditative and melancholy literature of the 'North'. This distinction was later identified with that between the 'classical' and 'romantic' (associated with France and Germany respectively), terms also connoting 'two eras in world history' (before and after the establishment of Christianity).

De l'Allemagne was banned by Napoleon and only properly published (in revised form and in England) in 1813. Surveying geography, customs, literature and religion, *De l'Allemagne* sought to introduce and interpret a foreign culture to a French audience, and undermine complacency about French cultural superiority. As part of this portrait 'of the German character and the distinctive spirit of their literature', Staël offered 'a simple and popular notion of their philosophical systems'. Staël provides synopses of Leibniz, Jacobi, Fichte, Friedrich Schlegel and Schelling, as part of a narrative largely structured around her account of the work of Kant. There are also thumbnail sketches of the state of, and connections between, French and English philosophy, and a general attempt to discredit sensationalism for undermining the possibility of morality. Although highly readable, doubts remain about the plausibility of Staël's picture of Germany as the paradigmatically contemplative nation, about the coherence of her Romantic enthusiasms, and about the accuracy and derivativeness of her account of German philosophy.

Considérations is a defence of the French Revolution, which established a tradition of liberal historiography. Staël sought to subvert the conservative myth of the Revolution as a rupture with fourteen centuries of unbroken order, by insisting that it was part of a continuing process (the latest episode in a thousand-year struggle for liberty).

Moreover, she attempted to identify the liberal current that she represented with part of the Revolution (the Constituent Assembly), and thereby deny responsibility for, or sympathy with, its other aspects (such as the Terror). *Considérations* also illustrates Staël's lifelong and determined defence of her father's reputation, and her Anglophilia. For Staël, England provided an enviable example of an enlightened nobility, working within the constitutional framework of bicameralism and the protection of individual rights, sharing political responsibility with a moderate bourgeoisie. England was also a Protestant country, and Staël, who considered Christianity indispensable to modern society, saw liberalism and Protestantism (which she sought to establish as the state religion of France) as linked by the shared assumption of moral equality.

Staël's political thought defended the value of privacy and of the liberty of the moderns (who prefer 'to fulfil their destiny apart from public affairs'). She challenged the identity of virtue and citizenship that underpinned republican models of freedom, arguing that 'liberty in modern times consists of whatever guarantees the independence of citizens from the power of the state', and rejected conceptions of sovereignty as unlimited and indivisible, insisting that political power should be limited and shared among different authorities.

Staël's literary success was considerable, and her intellectual and political importance was widely proclaimed. But although still acknowledged as an important precursor of the Romantic movement in French literature, and notwithstanding some recent feminist interest in her fiction, Staël has fallen into comparative neglect. It remains difficult to claim great philosophical significance for her work, but her accounts of historical development and of German philosophy are not without interest, and her political theory still merits attention.

Stair, James Dalrymple, Viscount (1619-95)

An outstanding lawyer, senior judge, politician, and the founding father of modern Scots Law, Stair is also an interesting, if minor, philosopher of law of the seventeenth century. Stair believed that law is an inherently rational discipline and that its content can be derived from the principles of natural law which are self-evident to all humans. Stair led an active life at the heart of public affairs in seventeenth-century Scotland, finishing up as the chief judge of the supreme civil court. Born in Ayrshire, Scotland, he became a teacher at Glasgow University in 1641, was called to the Bar in 1648, became Judge in the Scots Cromwellian Court 1657, Vice President of the Court of Session 1660, Lord President of the Court of Session (Scotland's most senior judge) 1671, exiled to Holland 1682, and reappointed Lord President in 1689 subsequent to the 'Glorious Revolution'.

Stair was a philosopher and a devout Calvinist as well as politician and judge. His thought reflected all these elements, stressing the role of God as the upholder of the natural law and the need for order in human affairs as expressed through contemporary positive law. Stair never published a purely philosophical work. Instead his legal theory is expounded within the *Institutions of the Law of Scotland* (1681), a book expounding the national law of Scotland, and which presupposes that there is a divine and rational basis for that law, and indeed all man-made law. The *Institutions* continues to be a work of high authority within the modern Scots legal system. Stair rejects the notion, widely held even in the seventeenth century, that human laws lack any inherently rational basis, being rather based on the arbitrary will of humans as expressed through custom, court decisions and legislation. This apparent lack of rationality in the law extended according to its exponents both to the content of the law and to its organization.

Stair took it for granted that God was the ultimate source of human values and law, and his thought is very much in the line of classical natural law thought in Europe as derived from Aquinas (see Aquinas, T. §13) through to that of his near contemporary Hugo Grotius (see Grotius, H.), whose *De iure belli ac pacis (The Law of War and Peace)* (1625) seems to have been a major influence on Stair (see Natural law §1). The *Institutions* differs from the work of Grotius in two completely opposite ways: in its greater emphasis on God as the ultimate source of law and in its concentration on the actual positive law. The structure of Stair's thought has a definite Aristotelian flavour, derived from the strongly Aristotelian syllabus he both studied and taught at Glasgow University, and is organized according to Aristotle's doctrine of causes: formal, efficient and final. Stair argues that the formal cause of law is reason, its efficient cause the actions of God and man, its final cause the promotion of human welfare. This is seen in his definition of law, which is similar to that of Grotius, as 'the dictate of reason determining every rational being to that which is congruous and convenient for the nature and condition thereof' (1681: I.1.1).

Stair is ambiguous as to how we know the natural law, an ambiguity also found in earlier natural law thinkers, in asserting that humans have both the inclination or instinct to follow the natural law and are also led to follow the natural law by the light of reason. This contradiction, also found in earlier natural law theories, Stair seems to have made no effort to resolve or even to be aware of. To the obvious objection that, if this is so, then what need have humans of positive human law, Stair answers that there is no conflict: 'the principles of equity are the efficient cause of rights and laws' (1681: I.1.17) (Stair understands the term equity to be synonymous with the natural law, particularly its role as the measure of positive law; see Justice, equity and law). The three principles of equity are obedience to God, that man is free to act except as specifically limited by God's commands, and the obligation to fulfil one's engagements (contracts). The principles of positive law derived from these principles of natural law are society, property and commerce, a concise trinity of proto-bourgeois values reflective of the developing mercantile economy of the seventeenth century. From these principles in turn are derived the three different types of human rights: *liberty*, the right to life and to personal integrity; *dominium*, the right of ownership of possessions; and *obligation*, the right to freely make contracts and the duty to fulfil those contracts. Stair stresses that it is these three types of rights which are 'the formal and proper object of law'; this is perhaps his most original insight and anticipates one of the central principles of the later legal positivists.

Stair's notion that positive legal rights are the proper object of the law becomes his organizing principle, enabling him to reject the hallowed practice of the civilian tradition, derived from Justinian's *Institutes*, of dividing the law according to the categories of persons, things and actions (see Roman law §4; Gaius; Justinian). Instead, the

Institutions deals first with the constitution and nature of rights, second the conveyance of rights and third the enforcement of rights. The thesis that law can be a ‘rational discipline’ is interestingly tested in this work.

State, the

States are inescapable, powerful and fundamentally important in the modern world. They spend a substantial portion of their members' wealth; they tax, confiscate or compulsorily purchase private property; conscript; impose punishments, including capital punishment; defend their members from aggression and protect their rights; and provide educational, health and other essential social services.

States are also central to modern political philosophy, and figure in its main topics. For instance, the various theories of social justice concern which principle or principles of justice should be followed by states. Again, discussions of the rights of individuals, or of groups, presuppose states to make the preferred rights effective. The answers to traditional questions, such as whether one is morally obliged to obey the laws of a state, or whether freedom is reduced by the state or made possible by it, must depend in part on what a state is taken to be.

The principal features of the modern state are basically agreed upon (population, territory, effective and legitimate government, independence). But there are underlying assumptions needing notice, and many questions about the state, especially concerning its proper activities, are controversial and disputed. Moreover, the value of the state can be challenged, and its future doubted, especially in the light of increasing economic and political globalization and moral cosmopolitanism.

1 Main features of the state

'State' is sometimes used in the broad sense to mean any independent political organization, sometimes in the narrow sense, to mean one particular type of political organization - the modern state. The latter is the usage considered here. The modern state emerged gradually as European political institutions changed. The date of its initial recognition by political philosophers is much discussed. Some put it in the sixteenth century (Skinner 1989), others several centuries earlier (Black 1992). Machiavelli, Bodin and Hobbes were prominent among early theorists of the state.

The modern state has been defined in different ways by anthropologists, sociologists, political scientists, historians and lawyers, as well as by philosophers. There is much overlap between the definitions and broad agreement on the main features which a political organization must exhibit in order to belong to the class 'the state' (Green 1988: ch. 3; MacCallum 1987: chaps 3 and 5; Vincent 1987: ch. 1). (1) There is a population which reproduces itself and whose members are socially related. (2) There is territory. (3) There is a single government, which: (a) is a distinct body of rule, supported by a judicial, administrative and military machine; (b) is the ultimate prescriber and enforcer of law for all those within its jurisdiction; (c) claims exclusive control of the use of force within the territory and has preponderant control of its use; (d) claims authority for its existence and actions and is generally accepted as authoritative. (4) The state is legally and politically independent from other states, and recognized by other states as an independent or sovereign state (see Sovereignty §4).

These features are necessary conditions and together are sufficient. A state without a population is inconceivable, for example; as is one without a territory, except possibly in the short term. However there is considerable vagueness about what counts as meeting the conditions, and much variation in the degree to which they are met. Moreover, probably no state fully realizes all the characteristics ascribed to the abstraction 'the state'. For example, there is no agreement on what size the population or territory must be, how effective the government must be in enforcing its decisions, how coherent and consistent the legal system must be, how many inhabitants may reject the government's or the state's authority even to the extent of active resistance, or by how many other states recognition is required.

It should be noted that the state cannot be the same as its government. The government is the state's administrative organ, and acts in its name; it may be constrained in what it does by a formal constitution (see Constitutionalism). The state persists through changes of government and through changes in the form of constitution. Again, the state is not the same as its society, being only the political aspect of it, only one social institution among the many that constitute society (for example, religious, economic and family groups); states vary however in the amount of independence they permit to the other social institutions (this is part of what distinguishes liberal from totalitarian states). Although it is often urged that a state should be a nation, and every nation a state, seldom if ever do states

coincide with nations (if 'nation' means anything more than the body of those who are fellow nationals of a state), and being a nation is not a condition of being a state (see Nation and nationalism §1). Nor need a state rest on any particular principle of legitimacy, or take a particular constitutional form, although there is now an expectation that it should be in some sense democratic (see Legitimacy §4).

2 Controversial issues

It is important to appreciate that, given the historical specificity of the modern state and of the philosophical discussion of it, the terms in which the modern state has been and still is conceived include values which are neither permanent nor universal, but derive from the political, cultural, religious and economic assumptions of their times. For example, the early states were thoroughly patriarchal, and in their accounts of them philosophers took for granted that the members of the state were male heads of households (Pateman 1988). More generally, early theorists operated with a particular view of what an 'individual' is, which affected their understanding of what the state is (Siedentop 1983). Contemporary theorists need to examine their own assumptions to check that they are not treating ephemeral values as if they were those of human beings as such. For instance, a philosopher in the Anglo-American tradition may unconsciously take a more sceptical view of the state and what it is capable of than one in the continental European tradition, and a Western philosopher implicitly may make numerous assumptions about the place of religion in politics or the nature of the individual which are not held universally.

The value component of the idea of the state becomes even more obvious when one asks what the proper role of the state is. There is no agreement on the purpose or purposes of the state. Empirically, a huge range of tasks, not all compatible, has been given to - and sometimes taken away from - the state (see Law, limits of). Theoretically, there have been great divergences. For example, some have allowed very limited scope to the state, claiming that if it has greater powers it infringes the rights of individuals, particularly with regard to liberty and property (for example, see Nozick, R. §2). Others contend that the state must act extensively to enable individuals to enjoy their rights, which otherwise remain formal and empty, or in order to to achieve other desirable goals such as social justice (see Rawls, J.). Again, some view the state instrumentally as the means of protecting the material interests of its members; whereas others think it is intrinsically good because its citizens can exercise public virtue by participating in its affairs (see Republicanism).

Given the controversy over the role of the state, it seems hopeless to stipulate as a necessary feature of the state any particular function beyond protection of basic rights against force and fraud, resolution or control of dispute and conflict, and maintenance of its own ability to enforce its own decisions and to remain independent internationally. These would be regarded as realistic and morally acceptable by all except anarchists (Wolff 1970). But even when the state is defined minimally, its future may still be in doubt.

3 The future of the state

The state's role, whether limited or extensive, is difficult, and there is always dissatisfaction with its performance. The world system of states also is found inadequate because it is disfigured by war. Inevitably it is asked whether the purposes assigned to the state could be achieved better by other means; either without any political organization as the anarchist contends, or by a different political organization.

State theorists judge the state far preferable to anarchy, especially in modern political circumstances. The proposal to abolish it overlooks the problems, especially in complex societies, of social life without central authority, and ignores the substantial benefits which states do provide. Of course having a state involves risks (such as oppression by the government), but the appropriate response is to minimize the risks and maximize the benefits (as liberal democracy seeks to do). The anarchist 'solution' forgoes the best means to achieve that. Furthermore, there is one moral benefit which would be impossible under anarchy: the personal self-education and development which comes from participating in law making and taking responsibility for important public decisions and their enforcement (see Anarchism §3).

The main political alternative to the state is a cosmopolitan organization which strictly could not be a state, there being no other equal body, but which had the attributes of a state (making it unacceptable to anarchism). Its population would be humanity and its territory the world, and it would be superior in law and power to every other political body. States would lose their sovereignty and necessarily cease to be states (see International relations,

philosophy of §4).

This idea has been seriously discussed since the eighteenth century, and involves no impossibility. It is claimed that the political problems of the present system are so great it must give way. The cosmopolis could achieve the aims of states as well as or better than states. In addition it could achieve material and moral goals which states are incapable of - eliminating war, protecting the environment and eradicating world poverty. In particular, if justice is to be achieved on an international scale it cannot be left to states: states make exclusive claims to resources and territory, on behalf of their own members, which conflict with the distribution required by principles of international justice (Baldwin 1992) (see Justice, international §4). Since the ultimate moral criterion is the equality of claims of all human beings, the final political unit should reflect this.

There are two issues here. First, should a cosmopolitan morality be given priority over the moralities of individual states? A major reservation is that the principles and content of the universal cosmopolitan morality are not agreed among philosophers let alone accepted by all states. There is also an objection: if the cosmopolitan morality conflicts with the state's morality, why should the former take precedence in all cases? May not a state's values, rooted in its own culture, have independent and greater moral importance?

Second, even if the case for cosmopolitan morality were conceded, why should states be replaced by a cosmopolitan 'state'? It is uncertain that the cosmopolis would perform its functions adequately; or effectively continue what states had done (whatever that was thought to be); or enable its citizens to participate adequately. If it fell short, there could be no political body to correct or control it.

However, it is not necessary to abolish states in order for cosmopolitan morality to be practised. The latter could be combined with legal and political statism. Each state could accept that it had obligations to human beings other than its own members; although it would be left to the state itself to decide what the obligation amounted to and what action was required. Legally, states could continue as sovereign: morally, they would subject themselves to global standards and recognize and act on wider obligations and responsibilities.

Beginning from a world of states, the way forward is through states, whether this be via a system of cooperation between states or their replacement by a single global political organization. In either case, questions about the nature, purpose and best form of the state remain important.

Statistics

The discipline of statistics encompasses an extremely broad and heterogeneous set of problems and techniques. We deal here with the problems of statistical inference, which have to do with inferring from a body of sample data (for example, the observed results of tossing a coin or of drawing a number of balls at random from an urn containing balls of different colours) to some feature of the underlying distribution from which the sample is drawn (for example, the probability of heads when the coin is tossed, or the relative proportion of red balls in the urn).

There are two conflicting approaches to the foundations of statistical inference. The classical tradition derives from ideas of Ronald Fisher, Jerzy Neyman and Egon Pearson and embodies the standard treatments of hypothesis testing, confidence intervals and estimation found in many statistics textbooks. Classicists adopt a relative-frequency conception of probability and, except in special circumstances, eschew the assignment of probabilities to hypotheses, seeking instead a rationale for statistical inference in facts about the error characteristics of testing procedures. By contrast, the Bayesian tradition, so-called because of the central role it assigns to Bayes' theorem, adopts a subjective or degree-of-belief conception of probability and represents the upshot of a statistical inference as a claim about how probable a statistical hypothesis is in the light of the evidence.

1 The classical tradition

Because classicists adopt a frequentist conception of probability (see Probability, interpretations of §3), the upshot of statistical inference within the classical framework is not, as it is within the Bayesian approach, the assignment of a probability to a hypothesis which measures how well the hypothesis is supported by the evidence. Instead, the classical approach focuses on finding rules or policies to guide the investigator's behaviour with respect to hypotheses - where the rationale for adopting such rules has to do with how often we can expect to make various sorts of mistake in the long run if we follow them. In this respect, the classical approach is similar in spirit to reliabilist programmes in epistemology (see Reliabilism).

Thus, for example, in classical significance tests the investigator proceeds by choosing a significance level (for example, 0.05) that corresponds to what they regard as an acceptable probability that they will mistakenly reject the hypothesis under test (the null hypothesis) even though it is true. The investigator then constructs a rejection region - a set of actions that would lead to rejection of the hypothesis - in such a way that the probability of rejecting the hypothesis even though it is true is less than or equal to the significance level. Intuitively, the rejection region will consist of outcomes that are unfavourable to the null hypothesis grouped together with the other possible outcomes that are even more 'extreme' or unfavourable to the null hypothesis. To illustrate, suppose that the investigator wishes to test the hypothesis that a coin is fair by flipping it twenty times and observing the number of heads, and there is no particular reason to think that, if the coin is biased, it will be biased towards heads rather than tails. The total probability of obtaining fifteen or more heads or five or fewer heads when flipping a fair coin twenty times is just under 0.05 and the observation of one of these outcomes will lead to rejection of the hypothesis that the coin is fair at a 0.05 significance level.

Within a classical framework, when we reject a hypothesis at the 0.05 level of significance, we are *not* entitled to infer that the hypothesis has at least a 0.95 probability of being false or at most a 0.05 probability of being true. Instead, the classical justification for the adoption of the above test is that, if it were repeated a large number of times, the characteristics of the test are such that we may expect to make a certain kind of mistake - rejecting the null hypothesis even though it is true - roughly 5 per cent of the time. According to classicists, this is a probability that has a perfectly straightforward frequency interpretation. It should also be understood that nothing in the formal theory of significance testing requires the particular choice of significance level adopted in this example. While 0.05 is a common choice, particularly within the social and behavioural sciences, investigators in many areas of science may and often do choose different significance levels. In general, this choice will correspond to the cost the researcher attaches to the error of rejecting the null hypothesis even though it is true. Presumably this cost will often vary from context to context - depending, for example, on the use to which the test result is to be put. This introduces what many critics regard as a subjective or arbitrary element: an outcome which would lead to

the rejection of a hypothesis at one significance level might not lead one to reject that hypothesis at some different (lower) significance level.

Suppose that one carries out a significance test and observes an outcome that does not fall within the rejection region. Properly speaking, an investigator can conclude in this case only that one has 'failed to reject' the null. The theory of hypothesis testing developed by Neyman and Pearson (1928) is motivated in part by the desire to construct an account of testing that permits decisions to 'accept' hypotheses as well as decisions to reject. Given that acceptance is a possibility, it is easy to see that significance testing focuses on only one of two possible errors one can make in testing a hypothesis. In addition to the possibility of mistakenly rejecting a true hypothesis (a so-called type I error), there is also the possibility of mistakenly accepting the hypothesis under test even though it is false (a so-called type II error). To specify the latter probability we must make reference to some alternative hypothesis against which the null is being tested. Thus, one of the distinctive features of the Neyman-Pearson account is that one tests a hypothesis by comparing it with some competing, rival hypothesis or set of such hypotheses (see Confirmation theory; Crucial experiments). Ideally a good test would minimize the probability of both a type I and a type II error, but unfortunately these two desiderata conflict, for reducing the former probability will in general increase the latter probability, and vice versa. The reader should consult the references for the solution to this difficulty recommended by Neyman and Pearson, but the fundamental point to appreciate is that, again, the basic rationale for adopting a test within this framework has to do with the frequencies with which one may expect to make various kinds of mistake if that testing procedure were to be repeatedly followed.

A similar rationale in terms of the error characteristics of repeated procedures underlies other forms of classical statistical inference. For example, a *confidence interval* is an interval constructed in such a way that it has a high probability (for example, 95 per cent) of containing some unknown parameter such as the bias of a coin. Since, for a classicist, is a parameter with a fixed value rather than a random variable, we cannot say in this case that the probability that falls within the constructed interval is 95 per cent. Instead, it is the confidence interval itself which is thought of as a random variable to which a probability attaches. The idea is that, if we were repeatedly to follow the same rule in constructing confidence intervals for , in the long run the intervals would contain about 95 per cent of the time.

2 The Bayesian tradition

The basic result on which the Bayesian approach relies is Bayes' theorem, a simple form of which is

$$to\mathrm{P}(\mathrm{H} \mid E) = \frac{P(E|H) \cdot P(H)}{P(E)} (1)$$

Bayesians interpret this theorem as telling us that the probability of a hypothesis H given evidence E - often called the posterior probability - is a function of the prior probabilities $\mathrm{P(H)}$ and $\mathrm{P(E)}$ (so called because they are the probabilities the investigator assigns to H and E prior to the collection of evidence) and the conditional probability or likelihood term $\mathrm{P(E \mid H)}$ (see Probability, interpretations of §5). In many statistical applications it will be more appropriate to use instead a continuous form of Bayes' theorem rather than the discrete form (1), but the basic structure of the inference will be the same. To illustrate, suppose that we are interested in estimating the unknown mean μ of some random variable which is normally distributed with known variance σ^2. Suppose that our prior probability regarding μ can itself be represented by a variable *X* ranging over different possible values of μ where *X* also follows a normal distribution with mean μ′ and variance σ'^2, and that we draw a sample of size *n* and that the sample mean is $\bar{y}$. When one combines these priors with the sample information, in accord with Bayes' theorem, the result is a posterior distribution for μ which is also normal and the mean μ'' and variance σ''^2 of which are given by

-

Here, unlike the classical approach, the result of the inference is the assignment of a probability distribution to μ'' and σ'' themselves. For example, we can use (2) to calculate the probability that μ falls within an interval centred around $\bar{y}$ while no such interpretation of a classical confidence interval is legitimate.

3 Criticisms of the classical tradition

One prominent Bayesian criticism focuses on the fact that, within classical approaches, the significance of evidence seems to depend on the test procedure or stopping rule by which the evidence is produced. For example,

a significance test like that described above, in which we flip a coin a fixed number of times (for example, twenty) and observe the number of heads which result, will have different error characteristics from a significance test in which we flip the coin until a fixed, predetermined number of heads are observed (for example, six) even though it may be the case that the observed result in both cases is six heads in twenty tosses. Indeed, the hypothesis that the coin is fair will be rejected at the 0.05 level if the observed outcome of six heads and fourteen tails is the result of a test conducted according to the second rule, but not if this outcome is the result of a test conducted according to the first rule.

Many Bayesians find it counterintuitive that the ‘same’ evidence should lead to different decisions about whether to reject depending upon which testing procedure is followed. If one is willing to assume, as many Bayesians are, that features of the stopping rule employed should not affect the likelihood term in a Bayesian analysis, then that approach will yield the result in the above example that the observed outcome of six heads, fourteen tails has the same evidential significance for the hypothesis that the coin is fair, regardless of which of the above rules was followed. Classicists respond by arguing, with considerable plausibility, that in many cases the testing procedure followed does seem relevant to the evidential import of the data it generates and that it is a defect in standard Bayesian analyses that they tend to ignore this.

Bayesians also argue that the classical notions of acceptance or rejection lack a clear meaning. Within a classical framework, to accept (reject) a hypothesis is not to regard it as true (false) beyond all reasonable doubt nor to assign it a high (low) probability. Bayesians argue that their picture, in which an investigator can have any degree of belief between zero and one and will continually change this as additional evidence accumulates, better fits the range of epistemic attitudes one finds in science and in ordinary life. Yet another Bayesian criticism focuses on what Bayesians regard as unacceptably subjective or arbitrary factors within the classical framework - for example, the choice of significance level. As we have emphasized, many of these features derive from the role that judgments about epistemic costs or values play within the classical framework.

While it is not possible to discuss these criticisms in detail, several further observations seem in order. The first is that, while the notions of acceptance and rejection may seem unclear, it is also by no means obvious that the Bayesian framework, with its demand for precise point-valued degrees of belief conforming to the probability calculus, adequately represents the structure of opinions and epistemic attitudes present in real life or in scientific investigation. The second point is that Bayesian strictures about acceptance and rejection within statistical contexts connect up with a more general debate within philosophy of science about whether scientists in fact ever accept hypotheses (or which may or may not be the same thing, believe them simpliciter) as opposed to assigning them degrees of belief strictly between zero and one and, if so, what such acceptance involves and whether, as a normative matter, it is ever rationally defensible (see Scientific realism and antirealism). Many writers - including some Bayesians - have argued that acceptance and rejection are ineliminable parts of scientific practice. The debate over the role that classicists assign to costs and benefits within hypothesis testing also echoes a more general debate within epistemology and philosophy of science over whether the stringency of standards for knowledge, justifiable belief and acceptance vary from context to context depending on, among other things, what is at stake in making various sorts of mistake and the investigator’s conception of the goals of inquiry (see Scientific method).

4 Criticisms of the Bayesian tradition

The fundamental classical objection to Bayesian approaches is the apparent subjectivity introduced by the choice of a prior distribution. One Bayesian response to this criticism, as noted above, is that subjectivity also enters into the classical programme at a number of points. Bayesians claim that their programme systematizes and makes explicit aspects of statistical inference that are unavoidably subjective, while avoiding certain objectionable kinds of subjectivity which are present in the classical programme, but often in an *ad hoc* and concealed form. The second Bayesian reply is that, as more and more data accumulates, the effects of different choices of prior distribution on one’s posterior distribution will often become less and less important. We can see this in the case of formula (2) - as sample size n grows, the sample data become more influential and the prior distribution less influential in determining the shape of the posterior distribution. Moreover, Bayesians point out that, when the choice of prior distribution does make a difference, the investigator can always produce a kind of robustness or sensitivity analysis, showing how (and to what extent) different choices of priors will lead to a different posterior

distribution, and leaving it up to other investigators to decide which priors to adopt.

Statistics and social science

There are a number of distinct uses for statistics in the social sciences. One use is simply to provide a summary description of complicated features in a population.

A second use of statistics is to predict (some) features of a unit or group in a population, given other features of the unit or group. For example, a company may charge lower health insurance rates for people who do not smoke, because smokers have a lower risk of lung cancer. Some companies could also charge lower health insurance rates for people who do not have a heavy cough, because the probability of having lung cancer is lower for such people. Predictions can be made by developing a probabilistic model of the joint distribution of incidence of smoking, lung cancer, and incidence of heavy coughs in the population.

A third use of statistics is to help predict the probable effects of adopting different policies. For example, the government may consider a number of alternative policies for reducing the rate of lung cancer. One policy would ban smoking. Another policy would make everyone who coughs take cough medicine. Both smoking and coughing are predictors of lung cancer. But because smoking is a cause of lung cancer, while coughing is an effect of lung cancer, the first policy seems as if it might achieve the desired effect, while the second does not. In order to answer policy questions we need to know not only how the variables are distributed in the actual population, but also how they are causally related. A causal model specifies the causal relations between features in a population, as well as specifying a probability distribution of the features. Statistical information together with causal information can be used to predict the effects of adopting a certain policy.

A fourth use of statistics is in helping decide which policies should be adopted in order to achieve specific goals. Such decisions are based not only on the probable effects of each policy, but also on assigning different utilities to each possible outcome. This use of statistics is a branch of decision theory.

1 Summary statistics

Consider a purely hypothetical example. Suppose a random sample of fifty units is taken from a population, and for each unit the values of three random variables (properties) are measured: *NCIG*, how heavy a smoker a person has been (on a scale from 0 to 7), *LC*, the presence of lung cancer, and *HC*, the presence of a heavy cough (on a scale from 0 to 7 of severity). (For this example, the sample was pseudo-randomly generated on a computer from an arbitrarily chosen population distribution.)

When the data are presented in the form of a table, the sheer volume of the information makes it uninformative, and it would be even less informative if the sample size were larger or the values of more random variables had been measured. For that reason, it is often useful to provide statistics which summarize important features of the sample. A number of summary statistics for the sample are shown in Table 1.

Table 1. Summary statistics

	NCIG	**LC**	**HC**
Minimum	0	0	0
Maximum	7	1	7
Median	3	0	3
Mean	2.84	0.42	3.04
Variance	4.30	0.25	5.63

A more informative visual presentation of the sample information about an individual variable such as *NCIG* is the histogram shown in Figure 1. The histogram shows the number of people in each category.

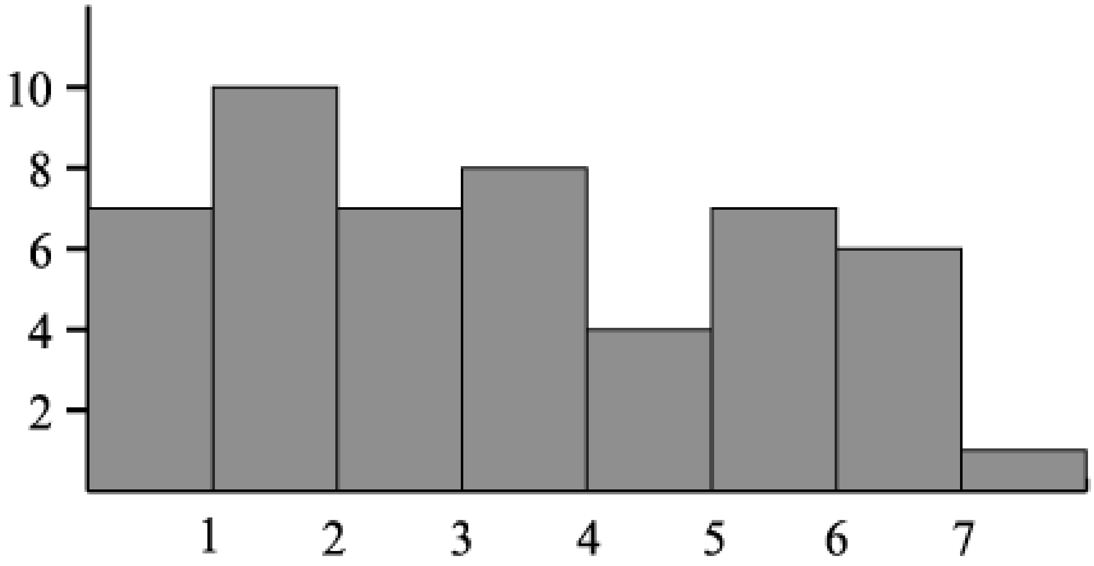

Figure 1

A histogram is useful for summarizing the distribution of a single variable, but it does not show the relationships between variables. One way of showing the relationship between a pair of multinomial variables is a contingency table, such as the one shown in Table 2. For each pair of values of *NCIG* and *LC* there is a box, and the number in the box represents the number of units in the population with that pair of values.

Table 2

NCIG									
		0	1	2	3	4	5	6	7
LC	0	6	9	3	0	0	2	3	7
	1	2	5	5	1	1	2	0	4

Devising visually informative displays of relationships between three or more variables is much more difficult than for two variables.

2 Probabilistic models

If *LC* is a variable that is difficult or expensive to measure, and *NCIG* and *HC* are relatively easy to measure, then given a new unit from the population, a doctor may wish to predict the value of *LC* for that unit from the more easily measured values of *NCIG* and *HC* for that unit. One simple method for predicting the value of *LC* for a new unit, given the values of *NCIG* = *x* and *HC* = *z* for that unit involves the following two steps:

First, use the sample to 'estimate' a population joint probability distribution P. (Strictly speaking, as explained below, statisticians usually speak of estimating the parameters of a family of distributions which may single out a unique probability distribution P, rather than of estimating P itself.)

Second, choose the value of *LC* for which

$$\mathrm{P}(LC \mid NCIG = x,\ HC = z)$$

is the highest (using an arbitrary rule to break ties).

One often attempts to 'estimate' a joint probability distribution from a sample by first choosing a family of probability distributions, and then progressively narrowing down the family until one probability distribution is

left. Deciding which family of distributions to start from, and which choices to make in the course of narrowing down the family of distributions is usually more of an art than a science. Let us now consider how the sample data might be used to obtain a joint probability distribution for *NCIG*, *LC*, and *HC* in the following way. First choose a family of distributions that is believed to contain the population distribution. This may be done by looking at the data, using background knowledge, or both. While the data may suggest a family of distributions, it does not generally single out a unique one. In the very simple example, *NCIG* and *HC* take on any of eight different values, and *LC* takes on one of two different values in the sample. In this case, it follows from the way that we have measured the variables that the distribution is a multinomial.

Having selected the family of distributions, a sample can be used to 'estimate' a unique distribution from the family of distributions. One way to do this uses the following formula, which is true of any multinomial probability distribution:

$to\mathrm{P}(\mathrm{NCIG}=\mathrm{x},\ \mathrm{LC}=\mathrm{y},\mathrm{HC}=\mathrm{z}) = \mathrm{P}\ (\mathrm{NCIG}=\mathrm{x}) \times \mathrm{P}(LC=y \mid NCIG=x) \times \mathrm{P}(HC=z \mid NCIG=x, LC=y)(1)$

Let H_1 be the family of distributions that can be represented in the form of equation (1). It is possible to pick out a unique multinomial distribution from the family of multinomial distributions by specifying P(*NCIG*), $\mathrm{P}(LC \mid NCIG)$, and $\mathrm{P}(HC \mid NCIG, LC)$. The quantities to be specified in order to select a unique distribution from a family of distributions are the parameters of the distribution family. The values of parameters can be fixed in one of two ways. A parameter can simply be assumed to have a value, perhaps on the basis of background knowledge. For example, the value of $\mathrm{P}(NCIG=2)$ could be fixed at 0.2; in that case $\mathrm{P}(NCIG=2)$ is a fixed parameter. If the value of a parameter is not fixed, but is instead estimated from the sample data, then the parameter is a free parameter. A free parameter is typically estimated by some formula that uses the values of the measured random variables in the sample. For example, an estimate of $\mathrm{P}(NCIG=2)$ in the population is given by the number of units in the sample with $NCIG=2$ divided by the number of units in the sample, and the other parameters can be calculated in an analogous way. Suppose that the free parameters are estimated in this way from the sample; let the resulting distribution be called P_1.

The same population parameter can be estimated by a number of different estimators. How should an estimator be chosen? One desirable property is that it be practically certain that the estimator can be made as close to the true value of the parameter as desired, as long as the sample is made large enough; such an estimator is 'consistent'. A second desirable feature of an estimator is that the expected value of the estimator equal the population value of the parameter; such an estimator is 'unbiased'. A third desirable property is that the probability of large differences between the value of the estimator on different samples of the same size is small; such an estimator has 'low variance'. Typically, the variance of an estimator decreases with increasing sample size. An estimator of a parameter which makes the sample data as likely as possible, given the constraints of the model is called a 'maximum likelihood' estimator; under a wide variety of conditions maximum likelihood estimators are unbiased and consistent. For a discrete distribution, the number of units in the sample with *NCIG* = *x* divided by the number of units in the sample is a maximum likelihood estimator.

How well does P_1 do in predicting the value of *LC*? In order to show how well P_1 predicts on a number of different samples, ten different samples of size fifty were pseudo-randomly generated on a computer from the same population probability distribution (the first sample was used to 'estimate' P_1). The number of errors in each sample made by P_1 in predicting the value of *LC* given the measured values of *HC* and *NCIG* is shown in Table 3.

Table 3

Sample	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**
Number wrong	3	7	13	14	17	11	13	12	12	9

H_1 is a very flexible family of distributions, and can reproduce any multinomial distribution exactly. A disadvantage of this is that it makes the 'estimate' of the population distribution vary a lot from sample to sample. That is why the number of wrong predictions of *LC* is relatively small in the sample which we used to 'estimate' (sample 1) but much larger on the other samples. Another way of looking at this is that the family of distributions

chosen has a large number of free parameters that have to be estimated with relatively few data points. This means that estimates from different samples vary quite widely. This in turn can lead to variations in the prediction of the value of *LC*, given the same values of *NCIG* and *HC*.

One way to reduce the variation in parameter estimates is to choose initially a family of models that has fewer free parameters. For example, let H_2 be the family of distributions that can be represented by the following formula:

$$to\ \mathrm{P}(\mathrm{NCIG}=\mathrm{x},\ \mathrm{LC}=\mathrm{y},\mathrm{HC}=\mathrm{z}) = \mathrm{P}\ (\mathrm{NCIG}=\mathrm{x}) \times \mathrm{P}(LC = y \mid NCIG = x \times \mathrm{P}(HC = z \mid NCIG = x)(2)$$

H_2 consists of those multinomial distributions in which

$$\mathrm{P}(HC = z \mid NCIG = x, LC = y) = \mathrm{P}(HC = z \mid NCIG = x),$$

that is, ***HC*** is independent of ***LC*** conditional on ***NCIG***. H_2 is properly contained in H_1. The free parameters of H_2 can be estimated using this formula and the sample by substituting the conditional frequencies in the sample for the corresponding conditional probabilities in the equation; call the resulting probability distribution P_2. Unlike H_1, not every multinomial distribution is contained in H_2. If the population distribution falls within H_2 (as it did in this example) then in general the predictions of *LC* from P_2 will be more accurate than the predictions of *LC* from P_1, because the number of parameters that need to be estimated has been reduced, and the estimates of the parameters tend to vary less from sample to sample. In the first sample, there are four units with $NCIG = 4$, where three of those four have $LC = 1$ and one has $LC = 0$. These four points are used to estimate fourteen parameters of P_1 (that is, $\mathrm{P}_1(HC \mid NCIG = 4, LC = 0)$ and $\mathrm{P}_1(HC \mid NCIG = 4, LC = 1)$) but only seven parameters of P_2 (that is, $\mathrm{P}_2(HC \mid NCIG = 4)$). Moreover, the predictions of *LC* are in general more accurate when the estimates of the population distributions are made using P_2 rather than P_1. Calculating the number of errors made in predicting *LC* from *HC* and *NCIG* on the same ten samples used before, the number of errors made by P_2 is shown in Table 4.

Table 4

Sample	1	2	3	4	5	6	7	8	9	10
Number wrong	5	11	12	10	17	7	10	8	9	14

Note that the number of errors made in sample 1 is larger for P_2 than for P_1. This is partially because sample 1 is the sample that was used to estimate the parameters of H_1 and H_2, and H_2 cannot reproduce the sample distribution exactly, while H_1 can. However, on all of the other samples, except samples 2 and 10, the prediction of *LC* from P_2 is at least as accurate as the prediction of *LC* from P_1.

While there are advantages to assuming that the population distribution lies in H_2, there are also possible disadvantages. If the assumption is false, the predictions of *LC* from P_2 may be worse than the predictions of *LC* made from P_1, because the parameter estimates could be biased. However, even if the population distribution does not lie in H_2, but it is close to a distribution that lies in H_2, the prediction of *LC* from P_2 may be better than the prediction made from H_1. Whether or not this is the case depends upon how close the population distribution is to a distribution that lies in H_2, and how much the variance of the estimator is reduced by assuming the distribution is in H_2. One way of judging whether the population distribution is a member of H_2 is by performing a significance test.

The simplest form of a significance test compares two hypotheses: in our case that the population distribution equals P_2 or that the population distribution equals P_1. The procedure either rejects P_2 or accepts P_2. There are two kinds of errors that can be made: rejecting P_2 when it is true, and accepting P_2 when it is false. In this context, the hypothesis is that P_2 is true is called the ‘null hypothesis’, the first kind of error is called a ‘type I error’, and the second kind of error is called a ‘type II error’. The power of the test is 1 - P(type II error). The goal is to minimize type I and type II errors. Unfortunately, these two goals usually conflict, so the actual procedure is to choose an acceptable probability of type I error, and then attempt to minimize the probability of type II error. An adaptation of the procedure can be used to test a given hypothesis against more than one alternative hypothesis. In that case, given a fixed acceptable probability of type I error, the goal is to find a test that minimizes the

probability of type II error against each of the alternative hypotheses. Although this procedure is widely employed in the social sciences to test probabilistic hypotheses, it has also come under severe criticism. The answer that one gets depends upon a number of free choices: the choice of which hypothesis is the null hypothesis, the choice of the alternative hypothesis, the choice of a test statistic, and the choice of a significance level. Moreover, given many parameters and small sample size, the probability of a type II error can be quite high.

The Bayesian approach to 'estimating' $\mathrm{P}(LC \mid NCIG, HC)$ is different from the procedure described above. First, choose some family of distributions, such as H_1. Let Θ represent the space of the set of parameters for the family of distributions. Next, for each in Θ, let *f*() be the value of a prior density function based on background knowledge. In the absence of specific background knowledge some variant of a ' non-informative prior' is often placed over Θ. Then the following equation can be used to calculate $\mathrm{P}(LC \mid NCIG, HC)$:

$$to\ \mathrm{P}(\mathrm{LC} \mid NCIG, HC) = \int_{\Theta} \mathrm{P}(LC \mid NCIG, HC, \theta)\ f(\theta \mid NCIG, HC)\mathrm{d}\theta$$

3 Causal models

Consider the following questions: what would the distribution of *LC* be if *NCIG* was forced to have the value 0 for each member of the population? What would the distribution of *LC* be if *HC* was forced to be 0 for each unit in the population?

These are questions about hypothetical populations, which may never exist. If P(*NCIG*, *LC*, *HC*) is the probability distribution in the actual population, let $\mathrm{P}_{\mathrm{Man}\,(NCIG=0)}\ (NCIG, LC, HC)$ and $\mathrm{P}_{\mathrm{Man}\,(HC=0)}\ (NCIG, LC, HC)$ be the probability distributions in the hypothetical population where *NCIG* has been forced to be zero, and the hypothetical population where *HC* has been forced to be zero, respectively.

How can $\mathrm{P}_{\mathrm{Man}\,(NCIG=0)}\ (LC)$ and $\mathrm{P}_{\mathrm{Man}\,(HC=0)}\ (LC)$ be inferred from P(*NCIG*, *LC*, *HC*)? Suppose hypothetically, that *NCIG* is a direct cause of *LC*, and *LC* is a direct cause of *HC*, but *NCIG* causes *HC* only via *LC*, and that these causal facts are known. This causal information can be represented in a directed acyclic graph of the following form:

$$NCIG \rightarrow LC \rightarrow HC$$

Figure 2

Here the arrow from *NCIG* to *LC* means that *NCIG* is a direct cause of *LC*, the arrow from *LC* to *HC* means that *LC* is a direct cause of *HC*, and the lack of an arrow from *NCIG* to *HC* means that *NCIG* is not a direct cause of *HC*.

Suppose that with each causal structure represented by a directed acyclic graph there is an associated set of probability distributions that are compatible with that causal structure. In the case of discrete distributions the rule can be stated very simply. If *G* is a directed acyclic graph representing a given causal structure, and every common cause of a pair of variables in *G* is also represented in *G*, assume that every probability distribution in a population with causal graph *G* can be factored in the following way:

$$\mathrm{P}(\mathbf{V}) = \prod_{V \in \mathbf{V}} \mathrm{P}(V \mid \mathbf{Parents}(V, G))$$

where V is the set of variables in *G*, and Parents(*V*,*G*) is the set of variables in *G* at the tail of a directed edge into *V*, for example, if $A \rightarrow B$ in *G* then *A* is a parent of *B* in *G*. If a distribution P can be factored according to this formula for directed acyclic graph *G*, then the distribution is said to satisfy the local directed Markov condition for *G*. In the case of Figure 2, the formula entails that

$$\mathrm{P}(NCIG, LC, HC) = \mathrm{P}(NCIG) \times \mathrm{P}(LC \mid NCIG) \times \mathrm{P}(HC \mid LC).$$

The local directed Markov condition is often, if not always explicitly, assumed in social science research. However, it is not universally true. In particular, if a directed graph is used to represent feedback, or if the properties of one unit affect the properties of another unit (via second-hand smoke, for example) the Markov condition may be false.

The following formula states a general rule for inferring the effects of forcing an 'ideal intervention' on variable *X* in a directed graph *G*, where an 'ideal intervention' forces some probability distribution $\mathrm{Man}(X)$ upon *X*, and has no other effect upon the system than through changing *X*.

$$\mathrm{P}_{\mathrm{Man}\,(X)}\,(\mathbf{V}) = \mathrm{P}_{\mathrm{Man}\,(X)}\,(X) \times \prod_{V \in \mathbf{V} \setminus \{X\}} \mathrm{P}(V \mid \mathbf{Parents}(V, G))$$

where $\mathbf{V} \setminus \{X\}$ is the set of all variables in V except *X*. Applying this equation to Figure 2, it follows that

$$\mathrm{P}_{\mathrm{Man}\,(NCIG)}\,(NCIG, LC, HC) = \mathrm{P}_{\mathrm{Man}\,(NCIG)}\,(NCIG) \times \mathrm{P}(LC \mid NCIG) \times \mathrm{P}(HC \mid LC),$$

so with a little arithmetic

$$\mathrm{P}_{\mathrm{Man}\,(NCIG)}\,(LC) = \mathrm{P}(LC \mid NCIG).$$

Similarly,

$$\mathrm{P}_{\mathrm{Man}\,(HC)}\,(NCIG, LC, HC) = \mathrm{P}(NCIG) \times \mathrm{P}(LC \mid NCIG) \times \mathrm{P}_{\mathrm{Man}\,(HC)}\,(HC),$$

so with a little arithmetic $\mathrm{P}_{\mathrm{Man}\,(HC)}\,(LC) = \mathrm{P}(LC)$. This accords with our intuition that manipulating a cause of *LC* changes the distribution of *LC*, but manipulating an effect of *LC* does not. (Formulation of this theorem in the form presented here is found in Spirtes, Glymour and Scheines 1993; and is stated in a form that does not use directed acyclic graphs in Robins 1986; and Wold and Strotz 1971.)

If the causal structure is not known, how can it be discovered? One approach would be to do a randomized experiment. A random sample could be taken from the actual population, and using some random device people could be assigned to a control group, who are forced to smoke a given number of cigarettes, or a treatment group, who are forced not to smoke. These two samples are just like samples from a hypothetical population in which everyone is forced to smoke a given number of cigarettes, and a hypothetical population in which everyone is forced not to smoke. This reduces the problem of determining the effect of *NCIG* on *LC* to a problem of inference about a population distribution from a sample distribution, which is the same question considered in §2.

In many cases, a randomized experiment cannot be performed, either for practical or for ethical reasons. The local directed Markov condition associates a given causal structure with a set of population probability distributions. If it is inferred from a sample that the population distribution does not lie in the set of distributions compatible with a given causal structure *G*, it could be concluded that *G* is false. This strategy obviously suffers all the problems of inferences about a population probability distribution from a sample distribution that were discussed in §2, but there are other problems in addition. If it is inferred from a sample that the population distribution does lie in the set of distributions compatible with a given causal structure *G*, it cannot be concluded that *G* is true, because the population distribution might also lie in the set of distributions compatible with other causal structures. For example, in the discrete case, every distribution that is compatible with any of the following three causal structures, is also compatible with the other two. Background information, such as time order, may be able to eliminate some of the alternatives, but if the background information is not available, using only the statistical data it is not possible reliably to decide between the three alternatives.

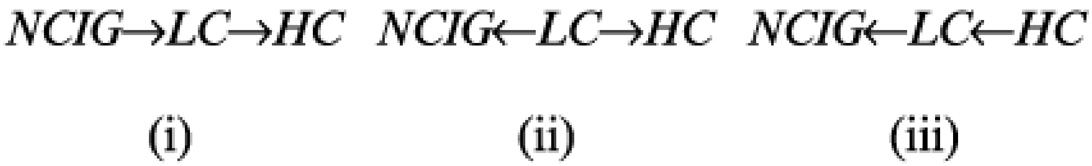

Figure 3

When the possibility of unmeasured common causes is considered, then the problem is even worse. For example, any distribution compatible with the causal models of Figure 3 is also compatible with either of the models depicted in Figure 4, as well as many others, where the 'T' variables are unmeasured.

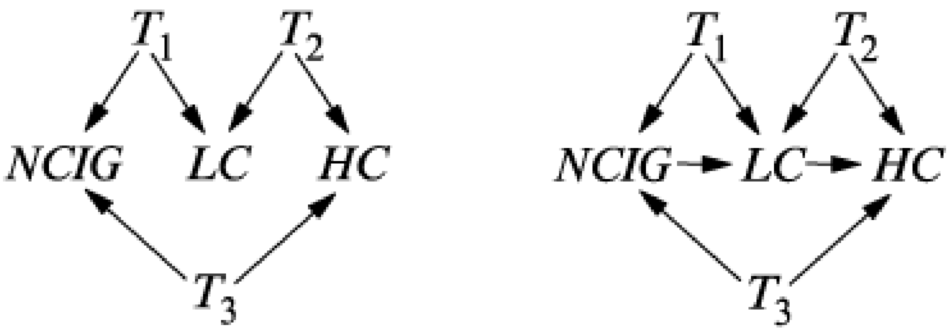

Figure 4

Again, strong background knowledge to the effect that there are no unmeasured common causes would eliminate the causal models in Figure 4 as a possibility. Another way to eliminate models such as those in Figure 4 is to make the (controversial) assumption that if the population distribution satisfies a given factorization, then it is entailed to satisfy that factorization for all parameterizations of the graph by the local directed Markov condition; call this the 'faithfulness' condition. Thus while there exist some parameterizations of the graphs in Figure 4 that can be factored according to equation 2, applying the local directed Markov condition to either of the graphs in Figure 4 does not entail that all parameterizations of these graphs can be factored according to equation 2. Given the assumption that a probability distribution is the marginal of a distribution that satisfies the local directed Markov condition and the faithfulness condition for the causal graph *G* that generated it, it is possible in some cases to narrow the set of graphs compatible with a given population distribution sufficiently to determine that *X* is a cause of *Y*, without knowing which occurred first. There is active research into devising algorithms for the automatic generation of causal models from sample statistics, background knowledge, and principles like the Markov condition, the faithfulness condition, and weaker assumptions.

For example, suppose that the causal structure *G* shown in Figure 5 generated a probability distribution P that satisfied the local directed Markov condition and the faithfulness condition for *G*, and that one knew P, but not *G*. If one admits the possibility of unmeasured common causes of variables, then P satisfies the local directed Markov condition and the faithfulness condition for an infinite number of different acyclic causal structures; however, all of those causal structures contain a directed path from *Z* to *W*, so it can be concluded from the local directed Markov condition, the faithfulness condition, and P, that *Z* is a cause of *W*. But in practice, one has knowledge of a sample distribution rather than the population distribution P, which makes the inference more difficult.

Steiner, Rudolf (1861-1925)

Rudolf Steiner held that humanity has passed through an astral and an etheric stage and has possessed intuitive and clairvoyant modes of consciousness. People, he held, once enjoyed psychic powers and existed in forms of matter more rarefied than those that characterize their current successors. Nevertheless, people still exist on four levels, the physical, the etheric, the astral and the spiritual, and earlier psychic skills are retrievable. Steiner, who called this theory 'anthroposophy', was particularly influenced by Goethe and theosophy.

Born on February 27, 1861, Rudolf Steiner studied from 1890 to 1897 at the Goethe-Archiv in Weimar, and from 1897-1900 was the editor of *Magazin: Monatschrift für Literatur (Magazine: Monthly Writings on Literature)*. In 1902, Steiner became general secretary of the new German section of the Theosophical Society (see Theosophy §2). He came to disagree with Annie Besant and Madame Blavatsky over attempts to build a 'spiritual science' on Eastern mysticism and over the promotion of Jiddu Krishnamurti as a messiah. In 1913, he founded the Anthroposophical Society. He died in 1925.

Steiner was initiated into an occult tradition by an adept whom he called 'The Master', and at the age of forty he began to speak publicly about what he believed to be clairvoyant experiences that had occurred to him since he was eight. He accepted the doctrines of reincarnation and karma, and the Hermetic teaching that humankind is the microcosmic clue to the macrocosm, so that discovering the true nature of humanity would also lead to a knowledge of the secrets of the universe. In 1896, he wrote his major work *Die Philosophie der Freiheit: Grundzuge einer modernen Weltanschauung (The Philosophy of Freedom: Essentials of a Modern Outlook)*, which contends that mechanistic science gives us only an abstract knowledge of natural uniformities. His model for a fuller human knowledge than that provided by mechanistic science was that of Goethe's 'primal plant', a self-evolving, self-developing organism (see Goethe, J.W. von §3). He claimed to have access to the Akashic records, which theosophists hold to be master records of all that has occurred since the beginning of the universe. These records allegedly exist in the form of impressions in the astral plane. Here, Steiner reported, he learned that humanity once possessed supranormal capacities that have since been lost.

Steiner taught that Christ came at the low point of the human descent into materialism and provided the opportunity for reascent. Uniting (South Asian) Indian and theosophical ideas with his interpretation of Christianity and the contents of his clairvoyant experiences, he constructed what he conceived of as a correct combination of modern science and religion. He reported perceiving nonhuman intelligences who affect human consciousness, some promoting spiritual advancement and some acting on behalf of human belief in a mechanistic materialism.

Steiner held that human nature has four levels: the physical body, the etheric body, the astral or soul body, and the spirit. The notion of an etheric body is connected with the notion of the aura, thought of as an envelope of vital energy that radiates from everything in nature and possesses a magnetic field. The etheric body is regarded as part of the aura, which is accessible only clairvoyantly. The notion of the astral body also links up with the notion of the aura, astral bodies also being said to be parts of auras. The astral body is viewed as the seat of emotions and as the carrier of consciousness in out-of-body and near-death experiences.

To each level of human nature, Steiner taught, there corresponds a level of human cognition: to the physical body corresponds perception; to the ethereal body, imaginative knowledge; to the astral body, inspirational knowledge; to the spirit, intuitive knowledge. He alleged that there are etheric forces at work among minerals and plants, and that awareness of these forces - through imaginative knowledge - provides the basis for a new science of 'biodynamic forming'. Inspirational knowledge is understood as knowledge of one's astral body, thought of as capable of existing independently of one's physical body and as what makes thought, memory and a sense of personal identity possible. Having intuitive knowledge involves experiencing one's entire life backwards, and, he held, includes encountering beings of higher intelligence.

Stevenson, Charles Leslie (1908-79)

Stevenson's major contribution to philosophy was his development of emotivism, a theory of ethical language according to which moral judgments do not state any sort of fact, but rather express the moral emotions of the speaker and attempt to influence others.

What do we mean when we say that something is good or bad? On the face of it, we are describing, attributing to the thing some property, goodness or badness. What could these properties be? How do we find out about them? Much of philosophical moral theory explores various answers to these questions. Stevenson thought that questions about the nature of moral properties were misplaced. Our moral judgments do not, at least primarily, describe at all. Uttering moral sentences has a different function: to express emotions, and to influence or invite others to share them. All of his main contributions appeared in *Ethics and Language* (1944) and a collection of papers, *Facts and Values* (1963).

If I say 'Ann Arbor is in Michigan', I express my belief that Ann Arbor is in Michigan, but I do not say that I believe such a thing. For what makes what I said true? Not that I really do believe that Ann Arbor is in Michigan; only the fact that Ann Arbor really is in Michigan. Stevenson's theory of ethical language, in a nutshell, was that when I say 'Inequality is bad', I have expressed a certain negative moral attitude towards inequality, though I have not said that I have it.

Stevenson's main argument for his theory was that '[a] person who recognizes X to be "good" must ipso facto acquire a stronger tendency to act in its favor than he otherwise would have had' (1963: 13). Following Hume, Stevenson thought this showed that the 'belief' that something is good must really be no belief at all, but an emotive attitude, since beliefs do not of themselves give us any tendency to act (see Hume, D. §§3-4).

Besides expressing the speaker's attitude, Stevenson said, moral statements also 'create an influence', they invite the audience to share in the emotion expressed. Thus, 'x is good' is akin to 'Let us approve of x'. And, in context, ethical statements can come to have secondary descriptive content; in Victorian England, for example, calling a woman 'virtuous' implied that she was chaste.

Stevenson's theory was enormously influential. Taking its cue from Ayer's brief remarks on ethics in *Language, Truth and Logic* (1936), Stevenson's theory added sophistication and subtlety (see Ayer, A.J.). His view has important affinities both with the work of R.M. Hare and with some later theories, all of which share the central tenet that moral judgments express not beliefs but conative attitudes (see Prescriptivism). Stevenson in particular stressed that his work did not include any substantive moral judgments, but rather comprised 'analytic ethics', or what is now commonly called 'meta-ethics', the branch of moral theory that is *about* ethics and ethical language (see Analytic ethics). For by claiming that moral judgments serve to express emotions, he had not expressed his own moral emotions at all.

Stewart, Dugald (1753-1828)

Dugald Stewart was, after Thomas Reid, the most influential figure in the Common Sense School; he was a major influence on Victor Cousin and Théodore Jouffroy in France and on most academic philosophers in the United States. Along with Reid and Cousin, Stewart made the Scottish tradition the dominant philosophy in America for half a century. His Elements of the Philosophy of the Human Mind and Philosophy of the Active and Moral Powers of Man were his most important works and went through a number of printings. The abridged edition of his Active and Moral Powers was reprinted ten times from 1849 to 1868.

Stewart followed Reid in claiming that any philosophy which contravenes the principles of common sense must be false, and the problem is to discover and eliminate the premise which yields such results. He added the requirement that philosophical propositions must not change the meanings *of concepts in ordinary life, and he also added a new dimension to Reid's agency theory. More than any other writer he emphasized correctly the epistemic similarities between Reid and Immanuel Kant, but he followed Reid in avoiding Kant's distinction between phenomena and noumena.*

Stewart disagreed with Reid in avoiding the phrase 'principles of common sense' as misleading, rejected his mentor's realistic interpretation of universals and provided his own nominalistic alternative. He also modified to some extent, though quite cautiously, Reid's rigid inductivism and made some concessions to a realistic interpretation of scientific hypotheses. Stewart was equipped to discuss issues in the philosophy of science since he was well versed in mathematics and physics, having been professor of mathematics at Edinburgh for ten years before being named professor of moral philosophy. Stewart was arguably the first and finest philosopher of science in the Scottish tradition.

1 Background

Dugald Stewart was educated at the University of Edinburgh and in 1771 went to Glasgow, primarily to attend the lectures of Thomas Reid. He became, first, professor of mathematics and, ten years later, professor of moral philosophy at Edinburgh; his philosophical work, published in eleven volumes by Sir William Hamilton, shows him to have been no carbon copy of Reid, but a philosopher who added important new dimensions to the Scottish tradition and occasionally criticized and departed from it.

2 Reid's common-sense view

Thomas Reid formulated a number of what he called principles of common sense, including such judgments as that objects are perceived as in space, and events are perceived as in time. Space and time are not concepts learned from experience, since 'object' presupposes 'space' and 'event' presupposes 'time'. Thus space and time constitute nativistic epistemic input possessed by perceivers themselves. Other examples of nativistic input include intuitions to the effect that every event has a cause, qualities are directly perceived as properties of objects, objects exist independently of being known, and agents in some cases act freely. Principles of common sense can be identified (not proven) because they are universally held and are unavoidable in the sense that denying them is pointless because in so doing one never gets rid of them. The philosopher who momentarily denies them reaffirms them in the marketplace or even while denying them acts upon them unwittingly. That David Hume pointed out this state of affairs was, for Reid, a very honest if self-defeating thing for a sceptic to do. Because the knowledge incorporated in the principles is nativistic (though activated by appropriate experiences) and because the principles are universal and unavoidable, they always take precedence over any discursive argument which contravenes them. When philosophy comes into conflict with common-sense principles, so much the worse for philosophy. Any philosophy which contravenes the principles must contain a fallacy and should be rejected.

Reid rejected scepticism because it violated the principles of common sense, not only claiming that their truth-values are not reliable but that even if they were one could not know it to be the case. Absolute idealism would have presented Reid with an even more standard example of the rejection of his principles. Absolute idealists undermine the truth-values of ordinary propositions with the concept of internal relations. They do not deny the ordinary meanings of 'physical object', 'space' and 'time', but insist that such entities are never exemplified except as misleading appearances. Since everything is internally related there are no separate entities,

and since ordinary statements imply the existence of such entities such statements cannot be true of reality, only of appearances. As with the sceptic, the problem for the idealist, Reid thought, is to discover the premise that leads to such absurdities and reject it.

3 Stewart's contributions to this tradition

Stewart wholly agreed with Reid's Common Sense metaphilosophy, according to which sceptics and absolute idealists who violate the truth-values of ordinary statements are *ipso facto* mistaken. However he did not think that Reid succeeded in showing that George Berkeley rejected the truths of common-sense principles and he felt that a new dimension needed to be added to Reid's metaphilosophy. Stewart was impressed with Berkeley's insistence that his views squared completely with common sense. 'The cup is on the table' remains true, if true to begin with, whether the cup and table are construed as independently existing objects or as clusters of sensations. Or, again, Kepler's laws of planetary motion remain what they are if the planets are interpreted as independent objects or clusters of sensations in God's mind. Stewart concluded that Berkeley had escaped Reid's net, though he thought the good bishop contravened common sense by violating the meaning of ordinary terms. What we need, he believed, is an accurate analysis of the meaning of the word existence,

> which analysis would have at once shown, not only that we are irresistibly led to ascribe to the material world all the independent reality which this word expresses, but that it is from the material world that our first and most satisfactory notions of *existence* are drawn.
>
> ([1854-60] 1877, vol.3: 54)

Hence both the meaning-value and the truth-value of ordinary propositions are inviolable and cannot be contravened by philosophical analysis.

Stewart's remarks on Berkeley seem well taken and yield a supplementary ingredient to Reid's metaphilosophy, namely that it is just as illegitimate for a philosophical position to violate the *meanings* of ordinary propositions as it is to contravene their truth-value. He formulated this supplementary criterion very clearly and distinctly but unfortunately did not consistently apply it in his subsequent discussion of the meaning of 'causality' and Hume's denial of natural necessity. Even though he did not consistently maintain the meaning-inviolability of common sense principles, he succeeded in making the point in an admirably clear and telling way. With the exception of Asa Mahan at Oberlin College and some others, subsequent members of the tradition omitted to take account of Stewart's criterion. Indeed, even G.E. Moore, much later, failed entirely where Stewart had succeeded, by formulating only the Reidian truth-inviolability criterion. Moreover, it must be kept in mind that Stewart indicated that philosophical positions often result from semantical misadventures, and that philosophers often argue from misleading analogies, and that such claims are essentially related to, and reflect, his meaning-inviolability criterion. The fact remains that Stewart, above all others in the Scottish tradition, stressed the importance of meaning analysis, and was outdone in this respect only in the twentieth century, by various strands of analytic philosophy.

Stewart contributed to the Common Sense tradition in still another way. He saw more clearly than most others the striking similarity of Kant's transcendental aesthetic to Reid's views on space and time. Kant and Reid had the same goals, namely to show the inadequacy of John Locke's empirical construal of space and time (or the inadequacy of any empirical construal), and to attribute the experience of objects in space and time to laws or forms inherent in the structure of the human intellect itself (see Kant, I. §§3-7; Locke, J. §§2-6). These fundamental laws or forms, of course, are not independent of experience, since they are awakened into their proper functioning only by the occurrence of a contingent relevant sensation. Stewart concluded:

> This is precisely the ground on which Reid has made his stand… and I leave it to my readers to judge whether it was not more philosophical to state… the *fact*, in simple and perspicuous terms, as a demonstration of the imperfection of Locke's theory, than to have reared upon it a superstructure of technical mystery, similar to what is exhibited in the system of the German metaphysicians.
>
> ([1854-60] 1877, vol. 5: 118)

Unless, like Stewart, one sees the epistemic similarities of Reid and Kant (discounting their very great metaphysical dissimilarities), one will not be able to understand the American philosophical movement called

transcendentalism, with Ralph Waldo Emerson and Theodore Parker sharing nativistic epistemic points of departure but developing totally different metaphysical views. From the initial intuitionistic framework, Emerson went towards absolute idealism, while Parker embraced the Scottish realist tradition of Reid and Stewart. The two Americans did not disagree on the importance of intuitive truth; they simply had incompatible intuitions. Stewart would have thought Emerson's intuitions unacceptable because they were not universal and unavoidable.

A further contribution made by Stewart to the Scottish tradition was in the area of agency theory. He argued that the concept of cause is not applicable to human actions: in general people act from motives which explain the point of what they do but do not cause them to do it. Agents are the causes of their own actions, guided by motives. Stewart accepted that all actions have motives, but stressed that 'motive' is a metaphorical way of referring to agents' intentions or purposes in performing acts and not to substantive factors that necessarily cause their actions. His important contribution, however, was to reject any need for criteria to distinguish between cause-effect and motive-act explanations. He rejected James Gregory's proposal that causal relations hold universally whereas motive-act relations cannot be universalized. In addition, he rejected the criterion that causes and effects can be described independently of each other while motives and acts cannot since they are logically or conceptually connected. As for his general argument against the need for any criterion whatever, Stewart looked upon a criterion as a sign that something else is the case and thought a criterion unnecessary since agent-causality is *directly attested to* by consciousness. Consciousness attests to the *fact* (Stewart's emphasis) that people can decide among contending motives, can initiate an act, and could have done other than they did; and such agent causality is obviously not applicable to the physical world.

Stewart's claim that the concept of causality is not applicable to human agency (though it may be applicable to abnormal behaviour) has the great merit of clarity and succinctness as well as philosophical insight. Moreover, his rejection of criteria for distinguishing causal and motive-model explanations seems a praiseworthy addition to the tradition. Why should it be necessary to provide a *criterion* for what is *evident*?

4 Stewart's deviations from this tradition

Stewart was critical of Reid's use of the phrase 'principles of common sense'. The use of this phrase, he felt, is easily misunderstood. 'Common sense' is a phrase that already has a fixed meaning in ordinary parlance which is different from Reid's, and the result is constant misrepresentation. In ordinary language, 'common sense' ordinarily denotes a type of wisdom different from what can be acquired through education. To claim, then, as Reid did, that a philosophical analysis which contravenes the principles of common sense is thereby nullified, is to suggest, unfortunately, that learned philosophers are to be governed by the voice of the general population. As Stewart pointed out, Reid did not of course intend this outcome, but his use of 'common sense' encouraged it. Surely there must be some more appropriate name for the fundamental laws of human belief?

Stewart's criticism of Reid's use of 'common sense' seems plausible and, in any case, influenced the later Scottish realists. His criticism amounts to saying that Reid gave a technical definition of the expression 'common sense' and one that, in fact, violates its ordinary meaning. Subsequent figures in the Scottish tradition, among them Victor Cousin, Henry Tappan, Asa Mahan, and James McCosh, apparently agreed with Stewart's criticism, since they all used different locutions for Reid's fundamental principles - common consciousness, basic intuitions, and fundamental laws of human belief.

Stewart was also critical of Reid's realistic interpretation of universals. Philosophers of distinction, Stewart wrote, have managed to reject the messenger theory of perception, but unwittingly cling to Locke's theory of ideas in other operations of the mind. When Richard Price and Reid abstracted from particulars certain properties shared in common and then generalized such abstractions into classes, they were committing themselves to universals which either exist as entities of some sort or exist as images in the minds of those who use propositions containing such universals. Stewart was unimpressed because people are no more introspectively aware of the existence of universals apart from particulars than they are aware of impressions apart from the object perceived. He had an elaborate analysis to show that there is no reason to believe in the existence of anything in the mind distinct from the operations of the mind itself. The correct view, he maintained, is the nominalistic one, according to which general terms refer wholly to sets of particulars which exemplify them - any one of which in a given set can be given as an example or paradigm of the general term being used. Stewart put forward a nominalistic analysis that depended upon signs and language. Universals, he thought, refer to general signs wholly linguistic in nature, and

thus require no ontological or psychological entities as referents. Reasoning involving universals is sign-reasoning, in which general terms have no other existence than the linguistic one shared with all other parts of a well-constructed language.

Stewart's discussion of the nature of universals is a felicitous attack on Locke's theory of ideas; and Stewart's nominalism, phrased in terms of linguistic signs, is not an unsophisticated viewpoint - particularly his notion that the significance of a general term conceived as a sign consists in its successful use as a memory device that conserves experiences individually learned (and can always be checked, upon demand, by paradigm instances of its denotation). Certainly such a view eliminates any necessity of referring general terms to images in the mind, as did Reid. However, Reid apparently did not think that images in the mind were substantive entities like Locke's ideas or Hume's impressions. If not, was Reid's view that just as we should substitute 'sensing' for 'sensation', we should substitute 'imaging' for 'image'? Stewart was not sure, and wiped the board clean by giving a linguistic analysis of universals.

A further way in which Stewart departed from Reid and enriched the Scottish tradition was to weaken, albeit hesitantly, Reid's rigid inductivism. Reid interpreted Newton's '*hypotheses non fingo*' literally, and, indeed, found most of the mistakes in physics and philosophy to be based on unfortunate hypotheses, such as Descartes' vortices and Locke's intervening messengers. But according to Stewart, we must not, after all, take Newton's '*hypotheses non fingo*' too literally. Did not Newton himself suggest numerous hypotheses in his *Optics* and assume that his readers would understand that his 'Queries' had experimental consequences and thus could be scientifically tested? They are quite unlike Descartes' vortices, which are defended wholly on a priori grounds (see Descartes §11). It is likely that Newton, in damning the use of hypotheses, referred only to those like Descartes' vortices that are immune to falsification. He approvingly quoted Boscovich's view that hypotheses or theories are necessary anticipations of solid scientific advances since there can be no relevant observation without hypotheses as a guide for where to look and what to look for.

Notwithstanding the aforesaid, Stewart makes it clear that he is not endorsing the use of hypotheses in science in any way except as heuristic devices. Principles of science are not established until they have been fairly inferred from undoubted facts and not from the uninterrupted confirmation of the consequences of hypotheses. Stewart's reservation about giving a realistic interpretation to scientific hypotheses was simply the familiar criticism that the confirmation of hypotheses commits the fallacy of affirming the consequent (see Fallacies). This issue was the key one among anti-Copernican astronomers during the Renaissance. They wanted to interpret all astronomical hypotheses as mathematical fictions. Nicolas Reymer Baer in 1597 publicly defended a nonrealistic theory of astronomical hypotheses. Reymer had expounded the nonrealistic theory in its most extreme form: not only were astronomical hypotheses merely mathematical fictions, they would not be hypotheses if they were true! In his monumental work *Apologia Tychonis contra Nicolaum Ursum*, Kepler rejected this view, claiming that a logical fallacy is not a scientific mistake and that the available confirmation overwhelmingly allows a realistic interpretation of the Copernican hypothesis. And Galileo emphatically agreed with Kepler. Stewart could not set himself against such scientific and methodological stalwarts and agreed that the evidence in Galileo's day already justified his realistic claim, which science in the future continued to support even in more direct ways. But even at this point Stewart claimed that it was not only that Copernicus correctly predicted all the facts that made the acceptance of his hypothesis legitimate even in his own day, but that there were various analogies between sources of illumination that also made the hypothesis acceptable. But of course Stewart could not deny that analogies themselves are a form of hypothesis.

Stewart's dependence upon Boscovich further confirms the attraction that hypotheses held for him. Boscovich himself argued against an inductive view of science, since his own physical theory had concepts that referred to unobservable events. Since Stewart accepted Boscovich's methodology he again committed himself by implication to the legitimacy of hypotheses with unobservables as long as they had testable consequences. Stewart was drawn to Boscovich's physical theory of point centres. He was also drawn to Boscovich's argument that corpuscularian theory is incoherent, because compressible bodies can interact by contact since they do not instantaneously acquire a common velocity but by mutual compression are enabled to slow down or accelerate in a finite time; however, this concept of interaction cannot be applied to the ultimate corpuscles because they are absolutely incompressible. Hence there can be no transfer of motion between ultimate particles. Stewart was reassured by this argument because it undercut the atomistic materialism of David Hartley and Joseph Priestley. However, such reassurance

makes no sense unless Stewart acknowledged the existential import of the corpuscularian hypothesis. It would be absurd to accept, as Stewart did, Boscovich's theory of point centres of mutual influence and the corpuscularian theory as legitimate competitors and yet deny on the methodological level that a system with reference to unobservables is ever justified.

Stewart was perfectly aware of the tensions in his own thinking. On the one hand, he was a thorough inductivist in philosophy and psychology and respected Bacon's methodological dicta. On the other hand, he was sensitive to the realistic interpretations of Kepler and Galileo, who saw that hypotheses were not simply instrumental devices. He was pulled both ways, and his work emerges as a significant connecting link between the naïve inductivism of Reid and the later technical views on scientific theory and causality held by James McCosh (see McCosh 1867), the last first-rate figure in the Scottish tradition.

Stirner, Max (1806-56)

Max Stirner is the author of Der Einzige und sein Eigentum (The Ego and Its Own), first published in Germany in 1844 and best known for its idiosyncrasies of argument and idiom. Stirner condemns modernity as entrenched in religious modes of thought and envisages a positive egoistic future in which individuals are liberated from the tyranny of those ideas and social arrangements which restrict autonomy. The Ego and Its Own was an impulse to the decline of the Hegelian left as a coherent intellectual movement, and played an important role in the genesis of Marxism; Stirner has also been variously portrayed as a precursor of Nietzsche, an individualist anarchist and a forerunner of existentialism.

Stirner (born Johann Caspar Schmidt on 25 October 1806 in Bayreuth, Germany) had a largely unpropitious start to adult life, passing through university without distinction, before becoming a teacher at a respectable private girls' school in Berlin. However, in his spare time he became increasingly involved with 'the free' (a group of left Hegelians led by Bruno Bauer), before leaving his teaching post in 1844 and publishing *Der Einzige und sein Eigentum (The Ego and Its Own)*, his most important and influential work. Following a brief period of unremunerative notoriety, Stirner settled into a somewhat indigent and solitary lifestyle. Hack journalism, translation work and (before she left him) his second wife's dwindling inheritance failed to avert two brief spells in a debtors' prison. Stirner contracted a fever after an insect bite on his neck, and died on 25 June 1856.

Insisting on the relativity of rationality, truth and language, Stirner rejects traditional forms of expression and modes of exposition. The consequent employment of aphorism and metaphor, neologisms, relentless paronomasia and juxtaposition of words with formal similarities or related meanings to present his views makes *The Ego and Its Own* a stylistically striking, if idiosyncratic, text. The only limitation which Stirner places upon use of language and mode of argument is that it should serve our individual ends.

The Ego and Its Own is structured around a tripartite division of human experience into categories of 'realism' (where individuals are dominated by external forces), 'idealism' (where individuals are dominated by ideas), and 'egoism' (where individuals escape domination by dealing with things and ideas as they wish, setting their personal satisfaction above all else). This tripartite division is elaborated and exemplified in accounts of individual development (in which childhood, youth and adulthood correspond to stages of realism, idealism and egoism), of human history (in which the ancient, Christian and future worlds are portrayed as epochs of realism, idealism and egoism respectively) and in a racial (and racist) analogue of that historical account (in which the Caucasian race passes through the realist stage of 'Negroidity' and the idealist stage of 'Mongolism' before reaching the 'truly Caucasian' future in which the race is liberated from the hegemony of natural forces and ideas).

Part One aims to demonstrate that modernity, the epoch of idealism, fails to escape from that which it claims to have outgrown, namely religious modes of thought. Thus Stirner rejects the contemporary consensus that Ludwig Feuerbach (§2), the leading figure of the Hegelian left, had completed the critique of religion (see Hegelianism §2). For Stirner, the errors of religion are not overcome by a rejection of God as transcendent subject, but by opposing the subordination of the individual to 'spirit' in any form. Feuerbach's anthropological reduction had not revealed human nature as it was, but rather deified an abstract and prescriptive account of what being human involved, thus leaving the 'real kernel' of religion, the positing of an 'essence over me', intact. This continued immurement within religious thinking is portrayed as paradigmatic of modernity. Liberals, socialists (including the young Karl Marx) and contemporary critics of all kinds are convicted of separating individuals from their real natures and positing some fictitious essence as their goal. In contrast, Stirner seeks to rehabilitate the concrete and diverse 'un-man' (*unmensch*) in each of us, to whom this 'foolish mania to be something else' is completely alien.

Part Two elaborates Stirner's conception of egoism by relating it to 'ownness' (*Eigenheit*), a form of substantive individual autonomy valued above all else. 'Ownness' is violated by any desire or action which involves waiving or suspending individual judgment, and thus conflicts with any conception, however grounded, of obligation or duty. Even the legitimacy of self-assumed obligations, incurred, for example, by the act of promising, is denied. Perhaps most importantly (not least in establishing his anarchist credentials), Stirner maintains that a relationship of absolute hostility exists between the individual and the state, based on the incompatibility of 'ownness' and any obligation to obey the law. The notorious adjunct is that crime is applauded as an assertion of 'ownness' against its

chief usurper, weakening the ‘cement’ (respect for law) which holds the state together.

Morality, defined by its positing of duties on the individual, is also sacrificed to ‘ownness’. For those (including Stirner) who dispute the idea of an exclusive opposition between morality and immorality, it does not follow that the egoist is immoral. Nor is Stirner inconsistent in stressing the evaluative superiority of egoism over other modes of experience and action. Stirner’s rejection of morality is grounded in an affirmation of the nonmoral good of egoism and not in a repudiation of values: that is, he allows a realm of actions and desires, which although not moral (because they involve no obligations to others) are still to be assessed positively. Stirner’s conception of morality is in this sense a narrow one, and his rejection of its claims is not coextensive with a denial of the validity of all evaluative judgment.

The escape from social relations which conflict with ‘ownness’ is not the end of all contact between persons, only the end of binding rules for resolving conflicts between competing interests, and the end of constraints, other than ‘ownness’, upon the pursuit of individual enjoyment. Stirner consistently characterizes the resulting relationship between egoists and their objects (including other individuals) in proprietorial terms, although, in contrast to traditional juridical conceptions of ownership, ‘egoistic property’ largely collapses into a notion of instrumental treatment. The ‘union of egoists’ is established as the only form of association which does not violate ‘ownness’ and so can constitute a suitable vehicle for advancing individual interests. In the historical maturity of egoism, community survives only in the form of this constantly shifting alliance which enables egoists to unite without loss of sovereignty, a purely instrumental combination whose good is solely the advantages which individuals derive from the pursuit of their interests - there are no final ends and association is not valued in itself.

Stoicism

Stoicism is the Greek philosophical system founded by Zeno of Citium c.*300* BC *and developed by him and his successors into the most influential philosophy of the Hellenistic age. It views the world as permeated by rationality and divinely planned as the best possible organization of matter. Moral goodness and happiness are achieved, if at all, by replicating that perfect rationality in oneself, and by finding out and enacting one's own assigned role in the cosmic scheme of things.*

The leading figures in classical, or early, Stoicism are the school's first three heads: Zeno of Citium, Cleanthes and Chrysippus. It is above all the brilliant and indefatigable Chrysippus who can be credited with building Stoicism up into a truly comprehensive system. 'Early Stoicism' - the main topic of this entry - is in effect largely identical with his philosophy.

No formal philosophical writings of the early Stoics survives intact. We are mainly dependent on isolated quotations and secondary reports, many of them hostile. Nevertheless, the system has been reconstructed in great detail, and, despite gaps and uncertainties, it does live up to its own self-description as a unified whole. It is divided into three main parts: physics, logic and ethics.

The world is an ideally good organism, whose own rational soul governs it for the best. Any impression of imperfection arises from misleadingly viewing its parts (including ourselves) in isolation, as if one were to consider the interests of the foot in isolation from the needs of the whole body. The entire sequence of cosmic events is pre-ordained in every detail. Being the best possible sequence, it is repeated identically from one world phase to the next, with each phase ending in a conflagration followed by cosmic renewal. The causal nexus of 'fate' does not, however, pre-empt our individual responsibility for our actions. These remain 'in our power', because we, rather than external circumstances, are their principal causes, and in some appropriate sense it is 'possible' for us to do otherwise, even though it is predetermined that we will not.

At the lowest level of physical analysis, the world and its contents consist of two coextensive principles: passive 'matter' and active 'god'. At the lowest observable level, however, these are already constituted into the four elements earth, water, air and fire. Air and fire form an active and pervasive life force called pneuma *or 'breath', which constitutes the qualities of all bodies and, in an especially rarefied form, serves as the souls of living things.*

'Being' is a property of bodies alone, but most things are analysed as bodies - even moral qualities, sounds, seasons and so forth - since only bodies can causally interact. For example, justice is the soul in a certain condition, the soul itself being pneuma *and hence a body. A scheme of four ontological categories is used to aid this kind of analysis. In addition, four incorporeals are acknowledged: place, void, time and the* lekton *(roughly, the expressed content of a sentence or predicate). Universals are sidelined as fictional thought constructs, albeit rather useful ones.*

The world is a physical continuum, infinitely divisible and unpunctuated by any void, although surrounded by an infinite void. Its perfect rationality, and hence the existence of an immanent god, are defended by various versions of the Argument from Design, with apparent imperfections explained away, for example, as blessings in disguise or unavoidable concomitants of the best possible structure.

'Logic' includes not only dialectic, which is the science of argument and hence logic in its modern sense, but also theory of knowledge, as well as primarily linguistic disciplines like rhetoric and grammar. Stoic inferential logic takes as its basic units not individual terms, as in Aristotelian logic, but whole propositions. Simple propositions are classified into types, and organized into complex propositions (for example, conditionals) and complete arguments. All arguments conform to, or are reducible to, five basic 'indemonstrable' argument formats. The study of logical puzzles is another central area of Stoic research.

*The Stoics doggedly defended, against attacks from the sceptical Academy, the conviction that cognitive certainty is achieved through ordinary sensory encounters, provided an entirely clear impression (*phantasia*) is attained. This, the 'cognitive impression' (*phantasia katalēptikē*), is one of such a nature that the information it conveys could not be false. These self-certifying impressions, along with the natural 'preconceptions' (*prolēpseis*) which constitute human reason, are criteria of truth, on which fully scientific knowledge (*epistēmē*) - possessed only by*

the wise - can eventually be built.

Stoic ethics starts from oikeiōsis, *our natural 'appropriation' first of ourselves and later of those around us, which makes other-concern integral to human nature. Certain conventionally prized items, like honour and health, are commended by nature and should be sought, but not for their own sake. They are instrumentally preferable, because learning to choose rationally between them is a step towards the eventual goal of 'living in agreement with nature'. It is the coherence of one's choices, not the attainment of their objects, that matters. The patterns of action which promote such a life were systematically codified as* kathēkonta, *'proper functions'.*

Virtue and vice are intellectual states. Vice is founded on 'passions': these are at root false value judgments, in which we lose rational control by overvaluing things which are in fact indifferent. Virtue, a set of sciences governing moral choice, is the one thing of intrinsic worth and therefore genuinely 'good'. The wise are not only the sole possessors of virtue and happiness, but also, paradoxically, of the things people conventionally value - beauty, freedom, power, and so on. However geographically scattered, the wise form a true community or 'city', governed by natural law.

The school's later phases are the 'middle Stoicism' of Panaetius and Posidonius (second to first century BC) and the 'Roman' period (first to second century AD) represented for us by the predominantly ethical writings of Seneca, Epictetus and Marcus Aurelius.

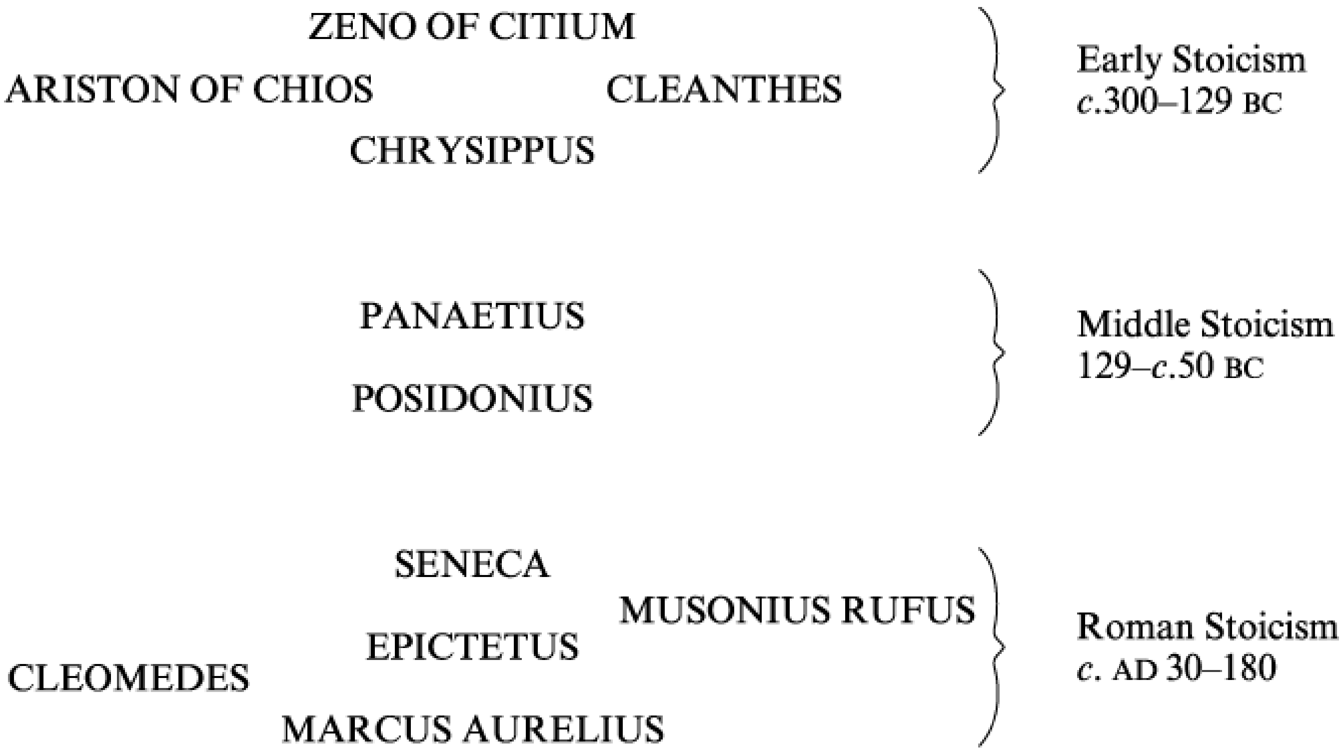
1 School history, sources

The name 'Stoic' originates from the Stoa Poikile or 'Painted Colonnade' at Athens, where at least the school's first generation used to meet. At first called 'Zenonians', they came in time to be known as the 'Stoa people', or 'Stoics'. The founder Zeno of Citium and his successor as school head, Cleanthes, forged the system in large measure. But it was the third head, Chrysippus, at the end of the third century BC, who developed it into a truly global philosophical creed.

Stoicism was in many ways a technically updated version of Socrates' century-old philosophy. Its debt to earlier thinkers like Heraclitus and Plato is also manifest. How far it took account of Aristotle's work, on the other hand, is disputed. Contemporary negative influences included Epicureanism, to which it was diametrically opposed on most issues, and the sceptical critiques of Stoic positions launched from the New Academy.

Chrysippus is the main voice of Early Stoicism. His successors Diogenes of Babylon and Antipater made their own contributions and modifications, but are seen as continuing the same tradition. In the late second and early first century BC, there was some softening of positions and a renewed interest in the writings of Plato. This has led many scholars to classify Panaetius and Posidonius as leading a separate phase, known as 'Middle Stoicism'. Finally, 'Roman' Stoicism designates that of the early Roman Empire, whose main spokesmen for us are the Latin essayist Seneca and the Greek writers Epictetus and Marcus Aurelius. The great bulk of their interests lies in moral philosophy.

The chart is a guide to entries on individual Stoics (listed in capitals).



We possess little evidence about the school's institutional base, in Athens or elsewhere, and it is not even clear whether it ever occupied its own premises. Its cohesion was, at any rate, primarily doctrinal. There was extensive agreement between individual Stoics, alongside a good deal of in-school quarrelling over specific issues. The most publicized dispute occurred in the first generation, between Zeno and the independent-minded Ariston of Chios. After his death, Zeno was revered by most Stoics, who would not openly criticize him. Rather, their philosophical disagreements often took the outward form of disputes as to what Zeno had really meant.

No early Stoic text survives, apart from Cleanthes' short *Hymn to Zeus*. But modern scholarship has managed to reconstruct most of the system in considerable detail from secondary sources, which incorporate numerous verbatim quotations. Book VII of Diogenes Laertius' *Lives of the Philosophers* is a major source, as is the doxographer Arius Didymus. Cicero's philosophical treatises contain first-rate presentations of various parts of the system. And invaluable evidence is available even from entrenched critics of the Stoics, such as the Platonist Plutarch, the Pyrrhonist Sceptic Sextus Empiricus and the doctor Galen.

2 The parts of philosophy

The Stoics formally sanctioned what was to become thereafter the canonical division of philosophy into three parts: physics, logic and ethics. Stoicism is arguably the first fully and self-consciously *systematic* philosophy. In the next three paragraphs correspondences will be noted between these three main areas of philosophy and the individual topics covered in the following sections. However, some of these topics (especially those in §§6-9, 14, 20) may not fit quite as neatly into any one of the three areas as the schematization implies.

Logic (§§10-13), the science of rationality (derived from *logos*, 'reason'), included not only inferential logic in the modern sense (more correctly called 'dialectic' by the Stoics), but also theory of knowledge, in which generation after generation of Stoics defended the existence of cognitive certainty against sceptical attacks. All Stoics, with the exception of Ariston of Chios, regarded logic as a fundamental part of philosophy.

Physics (§§3-9) - the study of nature (*physis*) - was a largely speculative or theoretical discipline, concerned with understanding the world's rational structure, and therefore embracing such diverse disciplines as biology, psychology and theology within its scope. It drew on the findings of contemporary scientists, but was not itself any kind of empirical science. Indeed, opponents accused it of wilful blindness to inconvenient new scientific discoveries, such as the demonstration by Alexandrian doctors that the rational mind is in the head, not the chest. Physics presupposed logic, at least to the extent that its findings were largely developed in strings of syllogisms.

Ethics (§§14-19), the authentically Socratic core of Stoic philosophy, was the discipline which described how happiness could be achieved. It presupposed physics, which supplied an understanding of the world's rational structure and goodness and of the individual's place in it.

There was less agreement about how the three parts related to each other. One favoured model compared philosophy to an orchard in which logic was the protective outer wall, physics the soil and trees, and ethics the fruit. Posidonius favoured the analogy to a living animal, in which logic was the bones and sinews, physics the flesh and ethics the soul. These and other analogies probably agreed in making ethics the ultimate aim and crowning achievement of philosophy. The value of physics and logic was in a way instrumental - to acquire the understanding which would make a happy life possible. But that understanding, a perfected rationality, was itself so integral to the Stoic conception of happiness that to call it instrumental may be to underestimate the true unity of Stoic philosophy.

Most leading Stoics put the three parts of philosophy into the sequence logic-physics-ethics, but some favoured other orders. Here they are likely to have been specifying nothing more than the best order in which to teach it, with no implications which might threaten its conceptual unity.

3 The foundations of physics

Physics is the study of nature (*physis*), and to understand the true nature of the world it is necessary to start at the very lowest level of physical analysis. The world and its contents consist of passive 'matter' (*hylē*) and active 'god' (*theos*). These two 'principles' (*archai*) totally interpenetrate each other, and their interaction underlies all change. The active principle is quite literally god, a divine causal force which imbues the entire world with rationality.

Why is the second principle, matter, added? Not in order to make the world corporeal, since god (as well as matter) is already corporeal. It is a fundamental Stoic principle that only bodies are capable of causal interaction, and god could not shape the world if he lacked causal powers. Rather, matter is added because god is an entirely active causal power, and there must therefore be something passive on which he acts. Matter is thus a purely theoretical construct, with no properties of its own to contribute beyond its mere passivity.

Matter and god, then, are conceptual rather than empirical items. At the lowest *observable* level, at which cosmic processes of change can actually be studied, matter and god are already by their interaction constituted into the traditional four 'elements' - earth, water, air and fire. Of these, air and fire form an active and pervasive life force called *pneuma* or 'breath', which by its presence in things constitutes their qualities (see Pneuma §2). Earth and water, on the other hand, are essentially passive elements, which serve a primarily material role: it is only the pervasive presence of *pneuma* in them that shapes them into complex items, including living things. Thus at the lowest phenomenal level earth and water take over the role which pure matter had held at the lowest theoretical level, while air and fire, paired as *pneuma*, take over a role analogous to that of the second principle, god.

Pneuma, as the combination of warmth and breathed air that is fundamental to animal life, had already earned a central place in medical theory, to which Stoic physics was heavily indebted. The distinctive contribution of Stoicism, at any rate by the time of Chrysippus, was to extend the explanatory role of *pneuma* beyond individual animal life, and to make it the vital power of the world as a whole. Since the Stoic world (following Plato among others) is itself a living creature, this extension was not as surprising as it may at first seem. *Pneuma* is the vehicle of the divine 'reason' (*logos*) which pervades and governs the entire world (see Logos §1).

Pneuma is all-pervasive, but varies in its properties according to its degree of tension. In its most highly attuned form, a portion of it may serve as the soul (*psychē*) of an animal (see Psychē). Many Stoics held that the human soul, at least, survives the death of the body (although it must of course eventually perish in the conflagration, see §5). A lesser grade of it is called 'nature' (*physis*), in a special sense in which the vegetative life force of a plant may be called its 'nature'. Finally, a still less refined form of *pneuma* is present in any discrete object, even a stone or a cup, being what endows it with its cohesion as a single object: as such, it is called the thing's 'tenor' or 'state' (*hexis*).

Both the primary 'principles' and *pneuma* play a key role in securing one of the most characteristic of Stoic tenets, the identification of 'being' with corporeality. At *Sophist* 246-7 Plato had launched a devastating attack on crude

materialists who restrict being to bodies. Since they can neither deny that there *is* (for example) justice, nor equate justice with some body, Plato suggests, they must abandon their position in favour of a new existential criterion, namely that to be is to have the power to interact. Stoicism sets out to defend the materialist position from Plato's attack: the two criteria considered by Plato are in reality one and the same, since the only things that have the power to interact *are* bodies. Hence to be is, after all, to be a body.

Virtually everything in the Stoic world is a body (for the few exceptions, see §7-8). This should not be misunderstood as reductive materialism. At the lowest level, 'god' is a body, but not a *mere* body: life and intelligence are his irreducible properties. God has corporeality in addition to these vital properties simply because only thus can he have any causal role in moving and shaping matter. Once this link of corporeality to causality is accepted, it is extended to the vast majority of items traditionally thought incorporeal. Justice, for example, must have causal powers if it is to do any good. It must sometimes make the limbs and voice move in ways in which they would otherwise not have moved. Therefore justice is a body. This apparently paradoxical outcome is defused once we learn *what* body it is. Justice is simply the soul in a certain condition; and the soul is a body, being an individual portion of *pneuma* pervading the organism and therefore able to govern its movements. Similarly, (spoken) words are bodies because they are vibrating portions of air, and that is how they can affect the thoughts of a listener.

Stoic corporealism was much derided by ancient critics, but it has the considerable merit of explanatory economy.

4 The continuum

Matter is permeated by god, and the passive elements by the active ones which constitute *pneuma* (see §3). What is this permeation? Mere juxtaposition of particles, such as atomism posits, could never constitute the intimate causal link between god and the matter which makes the Stoic world an inherently and ideally intelligent being. The active body must permeate the passive body 'through and through'. Stoic theory distinguishes three grades of mixture. 'Juxtaposition', for example of mixed grains, conforms to the atomist model. 'Fusion' (*synchysis*) is a kind of interpenetration in which the ingredients irreversibly lose their distinctive properties and a single new stuff is generated. In between these lies 'blending' (*krasis*), which also involves total interpenetration, but with the ingredients retaining their own distinctive properties. A helpful Stoic example, the fire which is seen to permeate a red-hot piece of iron, may clarify how the two ingredients can be seen as literally coextensive, rather than alternating as in 'juxtapostion'. It is 'blending' that describes the relation of *pneuma* to the material substrate.

'Division is to infinity, or ''infinite'' according to Chrysippus (for there is not some infinity which the division reaches, it is just unceasing). And blendings, also, are through and through' (Diogenes Laertius, VII 150-1). The doctrine of total interpenetration depends on the infinite divisibility of body, because if each of the blended stuffs consisted of indivisibly small particles these could only be juxtaposed, and not further blended. Hence the Stoics are, like Aristotle, committed defenders of the infinite division, on both mathematical and physical grounds.

For example, critics of the continuum had argued that if a finite body is infinitely divisible it will consist of infinitely many equal parts, and hence, impossibly, be infinite in size. Chrysippus replied that a finite object does not consist of any particular number of ultimate parts, finite or infinite. On an old puzzle of Democritus', whether the two circular planes yielded by horizontally slicing a cone are equal (in which case why isn't it a cylinder?) or unequal, Chrysippus replied that they are 'neither equal nor unequal'. Unfortunately our sources are so depleted as to permit little more than speculation about his defence of this claim. The same applies to the traces of a Stoic solution to the celebrated paradox according to which motion through an infinitely divisible continuum is impossible because it would consist of an infinite, and therefore uncompletable, series of sub-motions (see Zeno of Elea §5). They replied that the moving object may complete a distance in a single undivided (though divisible) motion - possibly on the ground that divisions are thought constructs, of which only a finite number can be actually imposed on a distance.

5 Cosmology and theology

The Stoic world is a living creature with a fixed life cycle, ending in a total 'conflagration' (*ekpyrōsis*). Being the best possible world, it will then be succeeded by another identical world, since any variation on the formula would have to be for the worse. Thus the Stoics arrive at the astonishing conception of an endless series of identical

worlds - the doctrine of cyclical recurrence, according to which history repeats itself in every minute detail. (For the leading Stoic dissenter on this, see Panaetius §1.)

Although a conflagration terminates each world phase, this is not its collapse into ruin but its achievement of perfection. That is because 'creative fire' (*pyr technikon*) is the purest, the most divine and the most creative form of divine *pneuma*, to be associated more with the light and warmth that promote growth than with flame. In our present world phase, the strongest concentration of creative fire is the sun, which some Stoics identified as the world's divine 'commanding-faculty' (*hēgemonikon*). During the conflagration what exists is in effect pure intelligence, which plans the next world phase in every detail. There follows a process by which the fiery stuff differentiates and stratifies itself into the four elements. It already at this stage contains the 'seminal principles' (*spermatikoi logoi*), which may be viewed as blueprints for the individual organisms and other entities which will eventually emerge. Both the dominant role assigned to fire and its association with divine 'reason' (*logos*) owed much to the influence of Heraclitus (see Heraclitus §4; Logos §1).

By 'god' the Stoics meant, primarily, the immanent principle governing the world, variously also identified with 'creative fire', with 'nature' or with 'fate' (on which see §20). Second, the world itself was also called 'god'. But - characteristically of Greek religious thought - this apparent monotheism did not exclude polytheism. Individual cosmic masses were identified with individual gods: for example the sea and the air were linked with Poseidon and Hera respectively, and the remaining traditional gods were likewise assigned specific cosmic functions. By means of allegorical rationalization, Stoic theology incorporated and interpreted traditional religion, rather than replacing it. Etymology (sometimes highly fanciful) was one tool used in this process. For example, two common forms of the name Zeus were 'Zēn' and 'Dia', which could also mean respectively 'Life' and 'Because of': this made it easy to interpret the traditional head of the pagan pantheon as symbolizing the Stoic primary deity, who was the world's life-force and causal principle.

The world, then, is itself divine, and is from first to last providentially planned and governed by an immanent intelligence. This thoroughgoing teleology owed much to Plato's *Timaeus*, but also to his *Phaedo*, where (96-9) Socrates had been portrayed as advocating a teleological physics, while admitting his own incapacity to develop one. We can here glimpse one of the many ways in which Stoicism sees itself as working out in full technical detail what was already implicit in the thought and life of Socrates.

Since the world *is* god, in his most manifest form, there is no distinction in Stoicism between proving the existence of god and proving the perfect rationality of the world. These proofs, most of which are variants on the Argument from Design, generated massive controversy between the Stoics and their critics (see especially Cicero, *On the Nature of the Gods* II-III). They include the following lines of argument. First, the world (especially the heaven) is like a giant mechanism, vastly superior to the most elaborate human invention. If must therefore, *a fortiori*, have an intelligent designer. Second, the creation of such a world by mere accident (for which see Epicureanism §8) is as unlikely as producing a literary masterpiece by shaking out letters randomly onto the ground. Third, the world is full of beneficial structures which cannot have been invented by its inhabitants: for example, the cycle of seasons, the temporal uniformity of the heavenly rotations, symbiotic relationships between species, and the food chain - including that miraculous foodstore the pig, created as a living being purely in order to keep the meat fresh. Fourth, the world is supremely beautiful, and therefore the work of a consummate artist. And fifth, any imperfections are either merely apparent (for example, wild beasts, which encourage the virtue of courage in us), or inevitable concomitants of the best possible structure (for instance, an example borrowed from Plato, the fragility of the human head). Sometimes localized sufferings are justified by the greater good they serve, even if it is not always evident what that good is. Chrysippus remarked, 'If I knew that I was fated to be ill now, I would set out to be ill. So too the foot, if it could think, would set out to get muddy'.

The syllogisms used to further this theology contained some highly controversial premises, for example: if there is anything which human beings cannot create, whoever did create it is superhuman. Or again: if a thing has rational parts (as the world does - namely us), then the whole must be rational too.

6 The 'categories'

Aristotle developed a complex ontological scheme, his ten 'categories' (see Aristotle §7; Categories). The Stoics, following not Aristotle but the early Academy, recognized just two categories: that is, they divided all existing

things into absolute or *per se* items, and relative items. For example, a house or dog is something absolute, whereas to be a slave, or sweet, is relative: being a dog does not, as such, involve standing in any relation, but to be a slave is to be somebody's slave, and to be sweet is to taste sweet to one or more percipients.

However, the Stoics also developed a more original, fourfold ontological classification, commonly known to modern interpreters as the Stoic 'categories', although it is unlikely that they used this term for it, and it is safer to call them 'genera'. It is disputed what the origins and purpose of this scheme were, but its most interesting recorded uses are to account for individual identity over time, and to amplify the thesis described in §3 that 'being' belongs only to bodies.

According to this classification, any given item may be seen as: (1) a mere 'substrate' (*hypokeimenon*); (2) something 'qualified' (*poion*); (3) something 'disposed in a certain way' (*pōs echon)*; and (4) something 'disposed in a certain relation' (*pros ti pōs echon*).

To start with the first pair. To pick out a thing as (1), a 'substrate', is merely to individuate it as a (temporary) lump of matter, for example, by pointing at it. To mark it as (2), something 'qualified', is to distinguish it by one or more qualities which it possesses. Here the Stoics have a precise physical analysis of what a quality is: a portion of *pneuma* imbuing the thing, whether as its soul or as some other inherent property, for example, its colour or its weight. There is a further subdivision of the 'qualified' into (a), what is 'commonly qualified', for example, dog, human, wise, green, and (b), what is 'peculiarly qualified', for example, Fido, Socrates. These correspond, roughly, to what is signified by (a) common nouns and adjectives, and (b) proper names.

It is the first pair that is invoked to explain diachronic identity. Such identity had been challenged by the growing argument (*auxanomenos logos*), a puzzle much favoured by the Stoics' sceptical opponents in the New Academy. This argument objected that any 'growth', however slight, must generate a new individual, since a body with even one new particle added is not the same body as before; therefore there can be no enduring subject of growth; and hence no growth. The Stoic answer is that what endures as the subject of growth is not the material substrate (or 'substance', *ousia*), but the 'peculiarly qualified individual'. *Qua* 'substrate' Dion (to use the Stoics' favourite stock name) has little if any endurance, but *qua* 'peculiarly qualified individual' (*idiōs poios*), that is, *qua* Dion, he endures throughout his life. Although Dion's matter constantly changes, the individuating quality that makes him Dion is with him, unchanged, from birth to death. That there is such a lifelong peculiar quality is a thesis of Stoic physics (there is no evidence what they thought it consisted in; the uniqueness of fingerprints is a modern discovery), but the need to solve the growing argument elevates it to the status of a metaphysical necessity. It also plays a part in Stoic epistemology (see §12).

As well as being (1) a lump of matter, and (2) both (a) human, wise and so on and (b) Dion, he is also at all times (3) in some disposition or other, for example, sitting, and (4) in some relation, for example, the person on my right. Here (3) and (4) represent the final two genera. The third genus, 'disposed in a certain way', is widely used to analyse as corporeal items commonly believed to be incorporeal (see §3). For example, knowledge is analysed as 'the commanding-faculty of the soul disposed in a certain way' - where the soul itself is corporeal, being *pneuma*. The fourth genus has similar analytic uses. What is special about it as a mode of being is that it picks out, not all relative items, but those whose being what they are is wholly parasitic on that relation, so that they could cease to exist merely because their external correlate changes or perishes. Suppose Dion is Theon's accomplice. *Qua* Dion he may continue to exist despite Theon's desertion or death; but *qua* accomplice he cannot. Hence 'accomplice' is a fourth genus item, while 'Dion' is not. For an important debate about the status of virtue, using this fourth genus, see §16.

7 Space and time

After their heroic defence of corporealism (see §3), it may come as a disappointment that the Stoics do nevertheless admit four kinds of incorporeal: place, void, time and the *lekton* or 'sayable'. These do not have actual being, because none of them possesses any causal powers to act or be acted upon. Nevertheless, an account of the world is incomplete without them, and they are therefore proper subjects of discourse. This entitles them to be described, with a lesser label, as having 'subsistence'.

A thing's 'place' is conceived by the Stoics as a portion of three-dimensional (geometrical) space, coextensive with its own occupant. This is given in the Stoic definition of place as 'that which (i) is able to be occupied by

what-is and (ii) is occupied throughout, (iii) whether by some thing or by some things'. Here (i) gives place its genus - roughly, space; (ii) adds its differentia, namely that its capacity to be occupied must be being exercised; (iii) specifies that the 'being', that is, body, which occupies it may be comprised of one or more discrete individuals. Put non-technically, a place is a fully occupied portion of space, whether occupied by a single entity or by a collection of entities.

When on the other hand some space's capacity to be occupied is not being exercised, it is called 'void' (or 'vacuum'). Void is defined as 'that which is able to be occupied by what-is, but which is not occupied'. As a matter of fact, this failure to be occupied is held to be a possibility only for the infinite space surrounding the world, since the world itself is an absolute plenum, containing no vacuum at all. The extra-cosmic void comes to be occupied - at least, some of it does - only during the 'conflagration' (see §5), when the world in its pure fiery state is said to expand into it.

The whole universe, called the 'all' in the sense of 'sum total', consists of the world body plus the infinite surrounding void. But of this combination, it is only the world body which is called the 'whole'. A whole, to qualify as such, must have a single unifying *pneuma* (see §3), something with which the void, being altogether empty, could not possibly be imbued. Thus the terminological distinction captures the Stoic thesis that the void is not any interacting part of the cosmic organism. It provides the conditions for one special kind of cosmic change, but it is not itself a participant in any change.

Since void is undeniably an incorporeal, and since void and place are both generically the same, it is hardly imaginable that the Stoics could have found a way of re-analysing place as a body. In any case, an adequate account of place must make sense of motion, that is, of a place being entered or vacated by a body. If the place were itself identified with the occupying body, no such account would be feasible.

The third incorporeal on the Stoic list is 'time'. Yet, curiously, in our sources individual parts of time are often analysed, in typical Stoic fashion, as corporeal. For instance, days and nights are simply the world's atmosphere in such and such a condition, and hence both they and the longer periods of time composed of them are said to be bodies. And reasonably so, one may think, since these temporal items could easily be deemed to have active or passive causal powers - for example, to be caused by the movement of the sun, and in turn to cause the progression of life cycles, and so on.

It seems to be only time as a whole which is conceded to be an incorporeal. Why so? Time (in this sense) is defined as 'the dimension of the world's motion'. Probably then the idea is as follows. The regularity of a body's motion - including the rotation of the heaven, which paradigmatically displays the progress of time - presupposes fixed spatial and temporal intervals through which it takes place. If either of those intervals were (in the usual Stoic corporealizing fashion) identified with the moving body itself, its motion would be left altogether without objective coordinates. This consideration may be what motivates the thesis that not only the spatial interval - 'place' - but also the temporal interval - 'time' - subsists independently of the moving bodies which pass through it.

8 The *lekton*

The fourth incorporeal on the list, the *lekton* (plural *lekta*), 'sayable', is a key term in Stoicism. Plato in the *Sophist* (261-2) distinguishes two linguistic tasks: naming, which is to pick out a subject, and 'saying' (*legein*), which is, roughly, to attach a predicate to that subject. This is probably the background to the Stoic *lekton*, which seems to have originally meant, as distinct from a subject, the sort of thing that you can say about a subject. As in Plato, it is typically expressed by a verb like 'walks' or 'to walk'. The actual action, walking, is itself a body: it is analysed as the commanding faculty of the soul (itself *pneuma*, and therefore a body) functioning in a certain way. But in certain contexts the predicate expressed by the verb 'to walk' is not properly identified with some body. The Stoics noted at least two cases - wishing, and causation. (1) When we say 'I *want* to walk', the soul which wishes is a body, but what it wishes for is not either itself, or for some further body to be added to it: it is for some predicate to become true of it. (2) When, for example, fire *causes* wood to be burnt, the effect generated is not some new body, burnt wood, since the wood already exists: it is that some new predicate becomes true of the wood. Thus, both the objects of wishes and the effects of causes are incorporeal predicates, technically called *lekta*.

The most prominent role of the *lekton* is in logic. Stoic logic (see §§10-11) is less interested in predicates as such -

what they call ‘incomplete *lekta*’ - than in the complete propositions containing them, the primary bearers of truth. Normally speaking the predicate expressed by a verb, for example, ‘…walks’, serves a full linguistic function only when it has a subject term supplied by a noun, for example, when someone says ‘Dion walks’. The notion of a ‘complete *lekton*’ is used to distinguish such cases. Most commonly, a complete *lekton* is the proposition expressed by a complete declarative sentence, as in the example given, although other complete *lekta* include questions (‘Is Dion walking?’), commands (‘Walk, Dion’) and so on.

A complete *lekton* is said to be produced by attaching a predicate to a ‘nominative case (*ptōsis*)’. This generates an interpretative puzzle. A *lekton* is well attested to be an incorporeal, yet a nominative case, being a grammatical form, ought to be a word and hence a body (a spoken word being vibrating air; a written word probably ink). Can a complete *lekton* be incorporeal and yet have one part which is corporeal? It may be that the subject term, by being expressed, makes the *lekton* complete without actually becoming part of it. Or it may be that the Stoics posited, in addition to the predicate expressed by the verb, a further incorporeal incomplete *lekton*, namely the subject of the complete *lekton*, expressed by the subjective nominative noun of the corresponding uttered sentence. Both suggestions (which do not exhaust those available) are problematic, and neither gains unequivocal support from the surviving evidence.

Nor is it easy to find a link between the incorporeality of the *lekton* and that of place, void and time (see §7). These latter three have some sort of mind-independent reality. Can the same be said for *lekta*? This is controversial, but the causal role of *lekta* must lend them some degree of objectivity, since causal processes presumably go on in the same way whether or not anyone is there to observe or analyse them. The *lekton* is defined as ‘that which subsists in correspondence with a rational impression’ (that is, roughly, with a human thought (see §12). This could be taken to make it parasitic on the thought processes of rational beings. But it may alternatively mean no more than that a *lekton* is a formal structure onto which rational thoughts, like the sentences into which they can be translated, must be mapped. This latter possibility bears some comparison to space and time, which, although defined by reference to their potential or actual occupants, are the objective dimensions onto which the positions and motions of those occupants are to be mapped, and are not altogether parasitic on them for their reality. The analogy must not be pushed too far, since the *lekton* differs from the other three incorporeals in not being any kind of mathematically analysable extension. But rationality is as much an intrinsic feature of the Stoic world as dimensionality, and it would be entirely Stoic to hold that there are objective parameters onto which its rational structures can be mapped

9 Particular and universal

There seems to be no room for universals in a Stoic world, where to exist is to be a body and hence, it seems, a particular. The highest ontological class recognized by Stoicism is that of ‘something’ (*ti*, plural *tina*), a class so broad as to include both bodies and incorporeals. Yet even this class excludes certain ‘not-somethings’ (*outina*), which Stoics identify with universals. That a universal is a ‘not-something’ they demonstrate by the following syllogism, diagnosed as being invalid precisely because in the minor premise it illegitimately substitutes a universal, ‘man’, for ‘someone’ (*tis*, the masculine form corresponding to the neuter *ti*) in the major premise: ‘If someone is in Athens, they are not in Megara; but man is in Athens; therefore man is not in Megara’. So universals are apparently metaphysical outlaws, intractable even to basic logical laws.

On the other hand, universals have a fundamental place in the job of the dialectician. In the tradition bequeathed by Plato, the Stoics regard the science of dialectic (see §10) as largely concerned with the activities of division and definition: dividing genera into species and defining individual terms. And the things divided and defined are, of course, universals - as Plato had already indicated by equating them with Forms.

Hence a dilemma: universals are essential to dialectic, and yet are logically incoherent items with no place in a Stoic ontology. Their resolution of the dilemma comes in two parts, one logical, the other epistemological. Logically, the dialectician’s use of universals is justified by a re-analysis. A dialectician’s definition, for example, ‘Man is a rational mortal animal’, actually means ‘If something (*ti*) is a man, it is a rational mortal animal’. A similar analysis was offered for statements of division. Thus dialectical pronouncements which appear to have universals as subjects are legitimate only because they are disguised conditional statements about particulars (‘somethings’). (A partial analogy can be found in modern attempts to re-analyse as logically coherent ‘The average man has 2.4 children’.)

The epistemological side of the resolution is required because Plato had maintained that universals are, as such, proper objects of thought. This time the conditional re-analysis offers little help in formulating a Stoic response. Rather, their reply is that universals are indeed objects of thought, or ‘concepts’ (*ennoēmata*), but that far from being objective parts of the world’s furniture they are nothing more than thought constructs. The thoughts themselves are real enough: being ‘conceptions’ (*ennoiai*), they are simply our mental *pneuma* in a certain condition, and hence bodies; but the ‘concepts’ which constitute the intentional objects of those conceptions are not themselves bodies, or indeed anything at all. This position makes it appropriate to call the Stoic doctrine of universals an early variety of ‘conceptualism’ (see Nominalism §1).

10 Dialectic

Dialectic is the main branch of what the Stoics called ‘logic’, and amounts, roughly, to the science of argument. Although dialectic was both theorized and applied in innumerable treatises, the Stoics never lost sight of the Platonic conception of it as a fundamentally two-person activity, involving the interrogation of an interlocutor. ‘Dialectic’ actually means ‘the science of dialogue’. The science of rhetoric differed from dialectic precisely in being the science of producing a good monologue, and was treated as a separate branch of logic. There was no uniform Stoic view as to whether theory of knowledge (see §§12-13) counted as part of dialectic, or as a third branch of logic.

In so far as it is concerned with argument, dialectic has distinct parts dealing with (1) signifiers and (2) significates. The former are words (and hence bodies; see §8), and Stoic dialectic’s concern with language as such led it, among other things, to develop the first real grammatical theory in Western thought. It became the basis of all subsequent work on grammar in antiquity and far beyond.

The latter term, ‘significates’, designates *lekta* (see §8), the incorporeal meanings which in their complete form are expressed only by whole sentences. Stoic logic (to use the word now in its modern sense) concentrates on one species of *lekta*, the declarative ones, called *axiōmata*. This term, literally ‘judgments’, is more familiarly translated as ‘propositions’. Stoic logic is indeed the first fully developed propositional or sentential logic. In this it differs radically from Aristotelian logic, which is a logic of terms (see Logic, ancient). The origins of Stoic logic probably lie less in Aristotle than in the work of the Dialectical school (see Dialectical school; Diodorus Cronus; Philo the Dialectician).

11 Inferential logic

Propositions are the bearers of truth and falsity, and simple propositions are the atomic units of Stoic logic. One symptom of the latter is that in syllogistic the negation sign ‘Not…’ is properly prefixed to the entire proposition, rather than (as in Aristotle’s logic) to its predicate. On the other hand, propositions are classified partly according to the subject terms which they contain: ‘This individual is walking’ (ideally accompanied by pointing) is a ‘definite’ proposition; ‘Someone is walking’ is ‘indefinite’; and propositions expressed with a noun in the subject position, for example, ‘A human being is walking’, ‘Dion is walking’, are ‘intermediate’. This triple distinction, like most aspects of Stoic logic, is adopted ultimately for the sake of validating the arguments in which these simple propositions feature. Indefinite propositions are verified by the corresponding intermediate or definite ones, but not vice versa. Hence in a syllogism whose major premise begins ‘If *x* is walking…’ and whose minor premise has the form ‘But *y* is walking…’, validity will normally be preserved if ‘*x* is walking’ is indefinite, but neither if it is definite while ‘*y* is walking’ is indefinite or intermediate, nor if it is intermediate while ‘*y* is walking’ is indefinite.

Complex propositions are those compounded of two or more simple propositions with the help of connectives like ‘and’ or ‘if’. Here again, they are selected for their role in syllogistic theory. Thus they comprise: conjunctive propositions, for example, ‘It is day and it is light’, which are important mainly in negated conjunctions, for example, ‘Not: it is day and it is dark’; disjunctive propositions, for example, ‘Either it is day or it is night’; and conditionals, for example, ‘If it is day, it is light’.

Simple and complex propositions are the basic components of syllogisms. These are held either to have, or to be reducible to by four rules of analysis known as the *themata* (see Logic, ancient §6), one of the following five forms: (1) ‘If the first, the second; but the first; therefore the second’; (2) ‘If the first, the second; but not the

second; therefore not the first'; (3) 'Not: the first and the second; but the first; therefore not the second; (4) 'Either the first or the second; but the first; therefore not the second'; (5) 'Either the first or the second; but not the second; therefore the first'. These are considered irreducibly primitive argument forms, hence called the five 'indemonstrables'.

A great deal of work went into the diagnosis of argument validity (see Logic, ancient §5). Both formal rigour and inferential cogency were demanded. A valid argument, according to Stoic logic, is one in which the conclusion follows from the conjunction of the premises in just the way in which in a true conditional the consequent follows from the antecedent. Hence the notion of 'following' became a focal point of debate. Some Stoics adopted a truth-functional analysis of a true conditional: the second proposition follows from the first just if 'Not (the first and not the second)' is true (see Philo the Dialectician for the background to this). But Chrysippus adopted a much stronger criterion, called *synartēsis* or 'cohesion': 'If the first, the second' is true just if the negation of the second is incompatible with the first. This restricts 'following' to a strongly conceptual kind of implication.

The restriction in turn led Chrysippus to the view that many ordinary-language uses of 'if' do not represent real conditionals, and should properly be expressed by the negated conjunction: not 'If the first, the second', but 'Not both: the first and not the second'. He applied this, for example, to the rules of empirical sciences such as divination (see §20); and analogous doubts led at least some Stoics to deny the validity of inductive inference. It was also applied, importantly, to the individual steps of the Little-by-little argument or Sorites (see Vagueness §2). The Academic sceptics plagued the Stoics with this puzzle, aimed at challenging important philosophical distinctions by asking to be told the exact cut-off point. The archetypal Sorites is 'If two grains are not a heap, three aren't; if three aren't, four aren't;…' - and so on to the conclusion that if two grains are not a heap then 10,000 are not. Chrysippus, who wrote extensively on this problem, advised that at some point in the procedure there will be premises of this form which it is proper neither to affirm nor to deny. But he also seems to have authorized the Stoic practice of insisting that the individual steps be formulated not as conditionals, as above, but as negated conjunctions: for example, 'Not both: seven grains are not a heap and eight grains are a heap'. Part of the point is clearly that, whatever the grounds for asserting such a premise may be, there is no actual incompatibility between 'Seven grains are not a heap' and 'Eight grains are a heap', so that assent to the premise must remain optional.

A wide range of other logical puzzles exercised Chrysippus and other Stoics. Some turned on ambiguities, and they developed a sophisticated classification of ambiguity types. The most persistent thorn in their flesh, however, was the liar paradox: 'I am lying' is, if false, true, and, if true, false (see Semantic paradoxes and theories of truth §1). This, along with the Sorites, was wielded by the Academics as a potentially lethal weapon against Stoic logic. It appeared to undermine the most basic tenet - that every proposition is either true or false. Chrysippus wrote many books in refutation of the liar paradox, but if he had his own favoured solution it is impossible now to recover it from our sources.

Inferential logic is ubiquitously employed in Stoic texts on physics and ethics. These regularly purport to demonstrate their tenets, and a demonstration is itself defined as an argument in which evident premises serve to reveal a non-evident conclusion.

12 Cognitive certainty

The main Stoic epistemological theorist was Zeno of Citium, who developed his ideas in response to a series of challenges from the Academic sceptic Arcesilaus (see Arcesilaus §2). His key term is *katalēpsis* - 'apprehension' or 'cognition' - the infallible grasping of some truth, usually by use of the senses. Arcesilaus systematically questioned the grounding of this notion, and argued instead for *akatalēpsia*, 'inapprehensibility', or 'the impossibility of cognition'.

The starting notion is *phantasia*, literally 'appearance' but commonly translated as 'impression' or 'presentation'. To have an impression is simply for things to strike you as being a certain way. Whether or not you take the impression to be true depends on a further cognitive act, assent (*synkatathesis*), which you may give or withhold at will. Since mature human beings are rational, their impressions are called 'rational impressions', meaning that their content can be expressed in language. Strictly speaking it is the proposition associated with it that we are taking to be true when we assent to an impression.

Zeno symbolized an impression by spreading the fingers of one hand, and assent by pulling them together. The next stage, represented by a fist, was *katalēpsis*, literally ‘grasping’, that is, infallibly recognizing the truth. This is not so much successive to assent as an ideally successful *way* of assenting, based on a sufficiently lucid impression. If instead someone assents to an unreliable impression, that will not count as cognition, but as mere fallible ‘opinion’ (*doxa*).

One final stage in the hand simile is *epistēmē*, ‘knowledge’ - not everyday knowing (which is better identified with *katalēpsis*) but absolute, scientific knowledge, such as is possessed only by the wise. Zeno symbolized *epistēmē* by bringing the other hand over to grasp his fist firmly. The point is as follows. *Katalēpsis* is infallible, in that it successfully applies a simple guaranteed cognitive mechanism shared by virtually all human beings: the truth stares you in the face, and you assent to it without the slightest possibility of being wrong. However, although on this very ordinary model of knowing all of us know lots of things, only the genuinely wise know that they know. This is because the wise, having a complete set of mutually supporting cognitions, could never be argued into disbelieving one of them. The unwise, that is, most people, could be argued out of their assent to genuine cognitions, because they are likely to have also a number of false beliefs, adopted as if they were genuine cognitions. You may, for example, plainly witness a miracle but disbelieve it because, being an Epicurean sympathizer, you falsely believe that the gods do not intervene.

The interest of the Stoic-Academic debate lies largely in its concentration, not on the wise, but on the infallible cognition attributed to ordinary people. The Stoics remained convinced, perhaps like most of us, that in everyday encounters where the truth stares you in the face you cannot be wrong and would be insane to withhold assent. But this common-sense position proved extraordinarily vulnerable to Academic criticism.

Debate centred on the kind of impression to which assent might be fully justified. Zeno called this the *phantasia katalēptikē*, ‘cognitive impression’, and initially defined it as one which is ‘(i) from something real (*apo hyparchontos*), and (ii) moulded and impressed according to that real thing itself’. Here (i) is likely to mean, not ‘caused by something real’ (no impression, however delusory, could be either caused by something unreal or totally uncaused), but ‘representing something actual’ - where it is indifferent whether the thing represented is an object or a fact. What (ii) adds is that the impression depicts this thing in full graphic detail. Arcesilaus’ complaint was that such an impression would still not be unmistakably true, since an identical but false impression could occur. This led Zeno to add a third clause, ‘(iii) such as could not be from something unreal’, which we can take to mean ‘such as could not represent some non-actual object or fact’.

The problem now was whether there could be such an impression. The ensuing debate focused partly on the nature of external objects, with the Stoics asserting that each object - even an identical twin - has some unique feature (see §6 for the metaphysical justification of this), and the Academics asking in reply how we could ever be sure that the relevant feature was currently evident. The Stoics also tried to describe the phenomenological features of these cognitive impressions, suggesting that as a species of impression they somehow carried their own badge of identity ‘just as horned snakes differ from other snakes’. The Academic reply, now through the mouth of Carneades, included appeal to cases where false impressions are so graphic that they lead to action, exactly as allegedly cognitive ones do: can the latter then have any intrinsic features to differentiate them from the former?

The final word belongs to a group reported simply as the ‘later Stoics’ (Sextus Empiricus, *Against the Professors* VII 253-60), probably including Antipater, a contemporary of Carneades. They point out that in all but the most special circumstances we simply have no choice whether to assent to a cognitive impression. Once you have such an impression, you do believe it, and that is that. What is in our own hands is not whether, once we are in a position where the truth is unmistakable, we accept it, but whether we take the trouble to get ourselves into such a position in the first place (moving closer, turning on the light, and so on).

This is quite an effective reply to those, like the Academics, who recommend suspending assent. But it leaves the question why the irresistibility of certain impressions should imply their truth. The Stoics here had recourse to a teleological argument: we would not have been given this superb cognitive equipment for any other purpose than to learn the truth. But of course the Academics could easily question the empirical premises on which that teleology was founded, bringing the debate full circle.

13 Criteria of truth

To identify the ‘criterion (or criteria) of truth’ was a standard requirement of Hellenistic philosophers (see Hellenistic philosophy). The Greek word *kritērion* is literally a ‘discriminator’, and a common equivalent was *kanōn*, ‘yardstick’. A criterion of truth was expected to be something naturally available to every mature human being as a basis for distinguishing true from false. Since it was that which made progress towards philosophical understanding possible, its availability and use could not be restricted to those who were already philosophers. When it came to naming the criterion of truth, the Stoics differed among themselves, but in some form or other they all identified it primarily with the ‘cognitive impression’ (see §12), the concept on which the Academic attack on the criterion likewise focused.

A second criterion, widely used in Stoicism and formally named as a criterion at least by Chrysippus, was *prolēpsis*, inadequately translated as ‘preconception’. A *prolēpsis*, literally ‘prior grasp’, is any naturally acquired generic ‘conception’ (*ennoia*) of a thing. Two other terms which are in most contexts interchangeable with it are *koinē ennoia*, ‘common conception’ (that is, common to all human beings) and *physikē ennoia*, ‘natural conception’. These descriptions distinguish *prolēpsis* from artificially acquired conceptions, usually culture-dependent ones, most of which are not directly given in experience but depend on a synthetic mental process. A centaur, for example, is arrived at by combining natural conceptions, a giant by enlarging them, and so on. Some artificial conceptions are liable to be misleading, but others are an integral part of scientific understanding, for example, one’s conception of the centre of the earth, acquired ‘by analogy with smaller spheres’. Human reason is itself simply an ample stock of conceptions, some but not all of them natural ones.

What makes a *prolēpsis* a reliable guide to truth is precisely the fact that the natural conception has not been tampered with. But where does the *prolēpsis* itself come from? The Stoics sometimes sound like hard-line empiricists, as when they compare the mind of a new-born infant to a blank sheet of paper which will in due course have its stock of natural conceptions written on it by repeated sense impressions, classified and stored as ‘experience’. Here a *prolēpsis* is ‘natural’ in the sense of being mechanically imprinted on us, and hence unmediated by fallible reasoning. However, some texts indicate that at least basic moral notions are called natural for the quite different reason that they are dispositionally innate in us.

Many Stoic arguments proceeded from appeals to some *prolēpsis* or ‘common conception’. This was their version of the widespread philosophical practice of citing what are alleged to be ‘our intuitions’. It ran into the difficulty that such a practice always faces: separating genuinely natural conceptions from those infected by one’s culture or other beliefs becomes the new bone of contention. For example, both Stoics and Epicureans appealed to the *prolēpsis* of ‘god’, but while the Stoics regarded providence as an integral part of this *prolēpsis*, the Epicureans argued that god’s providentiality was a cultural imposition on the basic *prolēpsis*, motivated by human bafflement at the world’s workings (see Epicureanism §9). A very similar dispute launches Stoic ethics.

14 *Oikeiōsis*

Epicurus proposed a method for identifying the genuinely natural human value: consult a new-born baby. Inarticulate infants, and for that matter irrational animals, cannot possibly have been infected yet with the norms of society, and their actions tell us, louder than any words, that their sole motivation is the acquisition of pleasure and the avoidance of pain. Stoic ethics responds by adopting the same starting point but questioning the Epicurean analysis of infant behaviour.

The highly influential concept which the Stoics introduced to facilitate their own analysis is *oikeiōsis*, variously translated as ‘appropriation’, ‘familiarization’, ‘affiliation’ or ‘affinity’. Literally, this is the process of ‘making something one’s own’. An animal’s *oikeiōsis* is its natural impulse or inclination towards something which it regards as belonging to it.

A creature’s first *oikeiōsis*, Stoics argue, is towards itself and its own constitution, a priority which it displays by making self-preservation its dominant goal. Far from pursuing pleasure, it courts pain in order to preserve and develop its natural constitution, as when we see a toddler repeatedly fall in striving to walk, and an overturned tortoise struggling to regain its upright position. As the human child develops, its *oikeiōsis* is extended beyond itself: it treats its parents and siblings as belonging to it, and cares for them accordingly, in much the same way in which it already cares for itself. In due course this same other-concern is extended to cover a wider range of people, albeit in increasingly diluted measure. At an extreme it takes in the entire human race. (For a graphic Stoic

elaboration of this idea, see Hierocles.)

Oikeiōsis is a continuum, stretching from the instinctive self-preservation of the new-born infant to the other-regarding conduct which is equally natural in rational adults. Where most ancient ethical systems struggled to explain altruism as an extended form of self-interest, there is no such tension in Stoicism, where others already fall within the ambit of our natural affection in much the same way as we ourselves do. This rationally extended sense of what belongs to us does not yet amount to moral goodness, but it is its indispensable basis. Goodness lies in our understanding and collaborating with the ideally rational world plan. It is no wonder that our natural *oikeiōsis* towards the rest of the human race should be what grounds the project of completely integrating ourselves into that plan.

Oikeiōsis is an affinity founded on the shared rationality of the entire human race. The doctrine thus helped to foster Stoic cosmopolitanism and other widely admired humanitarian stances (see §18). Seneca (§1), for example, reminded his readers of their moral obligations even to their slaves. Conversely, however, the *oikeiōsis* doctrine also encouraged a hardening of attitudes to non-rational animals, with which humans were judged to stand in no moral relation at all.

15 The indifferents

Perhaps the most characteristic doctrine of Stoic ethics is that virtue alone is good, vice alone bad. Everything else traditionally assigned a positive or negative value - health or illness, wealth or poverty, sight or blindness, even life or death - is ‘indifferent’. By making this move, the Stoics authorized the use of the word ‘good’ in a distinctly moral sense - a usage which is still with us, although they themselves bought it at the high price of simply denying that the word, properly understood, has any other sense.

The inspiration of this doctrine is undoubtedly Socratic. In various Platonic dialogues (see especially *Euthydemus* 278-81, *Meno* 86-9), Socrates argued that most things traditionally called good - typified with largely the same examples as the Stoic ‘indifferents’ - are in their own nature intermediate between good and bad. If used wisely, they become good, if unwisely, bad. Hence wisdom is the only intrinsically or underivatively good thing (see Socrates §§4-6).

This Socratic argument encouraged the Cynic idea that only wisdom - or more generally, virtue - is good, and that such coveted possessions as reputation, health and physical comfort are literally irrelevant to the goodness, and hence the happiness, of one’s life (see Cynics). The Cynics acted on this by adopting a bohemian lifestyle, disdaining the values of society. And Zeno, the founder of Stoicism, had his first philosophical training from a Cynic. Zeno’s independent-minded colleague Ariston stuck close to the Cynic thesis (see Ariston of Chios §2). Zeno, on the other hand, modified it in a way which does more than anything else to account for the widespread success of Stoicism; Zeno’s subtly revised position leaves wealth, fame, and so on morally indifferent, while explaining why we are nevertheless fully justified in pursuing them.

Although being healthy does not make you happy, Zeno maintains, the natural thing to do in ordinary circumstances is nevertheless to stay healthy and avoid illness. We should not try to suppress this natural instinct, because to be happy - the ultimate goal to which we all aspire - is to be totally in tune with nature. Therefore the proper way to start out is to respect the preferences which nature dictates, opting where possible for affluence, high civic status, family values and other ‘natural’ desiderata. As you progress, you will learn when to vary the formula. It may be that in special circumstance the right way for you to fit in with nature’s plan is to be poor, or sick, or even to die. If you understand why one of these is the rational and natural thing for you, you will embrace it willingly, and thus further rather than hinder your project of perfect conformity with nature. But barring such special circumstances, the natural values to adopt coincide on the whole with the ordinary values of society.

This leads, in typical Stoic fashion, to a terminological jungle of epithets for the ‘indifferents’. The ‘things which accord with nature’ (*ta kata physin*), such as health, have a positive, albeit non-moral, ‘value’ (*axia*), and are therefore labelled ‘preferred’ (*proēgmena*), which means that in normal circumstances we should opt for them, they are ‘to be taken’ (*lēpta*). The ‘things which are contrary to nature’ (*ta para physin*), such as illness, earn a contrary set of technical terms: ‘disvalue’ (*apaxia*), ‘dispreferred’ (*apoproēgmena*), ‘not to be taken’ (*alēpta*).

The linchpin of Stoic ethics is the way in which it legitimizes a familiar scale of personal and social values, while

denying them any intrinsic worth. Their value is purely instrumental, because they are the subject matter of the choices by means of which we progress towards true moral understanding. We might compare the relative ‘values’ of, say, illness, fame and eyesight, in Stoic eyes to the relative values of cards in a card game. Learning how to choose between these, and even to sacrifice cards of higher value when the circumstances dictate, is an essential part of becoming a skilled player. But these choices matter only instrumentally: It would be absurd to compare the value of an ace to the value of being a good card-player. In Stoic eyes it is an equally grave error - although unfortunately one of which most people are guilty - to rank wealth or power along with moral goodness on one and the same scale.

The things which are naturally ‘preferred’ can be encapsulated in rules: honour your parents, take care of your health, cultivate friends, and so on. From the start - although again with the dissent of Ariston of Chios - the Stoics attached importance to rules or ‘precepts’ as the basis of moral progress. What a precept prescribes is a *kathēkon* (plural *kathēkonta*), a ‘proper function’ or ‘duty’, and many Stoic treatises were devoted to working out detailed lists of *kathēkonta*. A *kathēkon* is defined as ‘that which, when done, has a reasonable justification’: for a rational adult, what is reasonable and what is natural should coincide.

There are two main types of *kathēkonta*: circumstantial and non-circumstantial. Circumstantial *kathēkonta*, that is, those prescribed only in very special circumstances, include such abnormal acts as self-mutilation, giving away your property, and even suicide (something of a Stoic obsession, inspired by Socrates’ willing death). Non-circumstantial *kathēkonta* are, despite their name, not prescribed in literally all circumstances, since to each non-circumstantial *kathēkon* (for example, looking after one’s health), there is opposed a circumstantial one, (for example, in very unusual circumstances, getting ill). Rather, they are ‘non-circumstantial’ because they are what, other things being equal, you should do as a matter of course, and not as a response to your present circumstances.

16 Goodness

Kathēkonta are ‘intermediate’ patterns of behaviour - that is, available to everybody, wise and non-wise alike. Yet in advertizing them the Stoics regularly referred to the conduct of the ‘sage’, the idealized wise person whom they always held up as a model, despite admitting that the criteria for this status were so tough that few people, if any, ever attained them. What was possible for everybody, they insisted, was progress (*prokopē*) towards this state of wisdom, and that is why they stressed the continuity between the proper conduct of the non-wise and the ideally good conduct of the wise. When you actually become wise and virtuous, what are outwardly the very same kind of *kathēkonta* which you were already habitually performing are suddenly transformed by your new state of understanding, earning themselves the name *katorthōmata* or ‘right actions’.

Alongside this continuity in moral progress, there is also the sharpest possible discontinuity. One of the most notorious Stoic paradoxes was that all sins are equal. If you are not virtuous and wise, you are totally bad and foolish. The wise are totally happy, the foolish totally unhappy. Whatever strides you may have made towards virtue, you are no happier till you get there. They compared what it is like to be drowning: whether you are yards from the surface or only inches from it, you are still just as effectively drowning.

The motivation of this depressing thesis is not entirely clear. Stoic concern with the paradox of the Sorites (see §11) may have contributed to it, but the main driving force seems to be the conviction that actual goodness, if achieved, differs not in degree, but in kind, from the scale of natural values. At a certain point of moral development, you notice an emerging agreement or harmony between your individual choices and acts. It is, thereafter, not the choices and acts or their objects that matter any longer, but harmony for its own sake. Only from that point on do you have a conception of what goodness is: it is located in a perfect ‘agreement’ both within the individual and between that individual and cosmic nature.

What does this agreement consist in? Despite the Stoics’ extensive cataloguing and classification of the *kathēkonta* which the sage will perform, ultimately the wise are characterized, not by the actual success of their actions - which may not always be in their control - but by the morally perfect frame of mind with which they act - in other words, by virtue (see Aretē). Socrates had propounded that paradox that virtue is knowledge: all there is to being good is to *know* the right things. The Stoics develop this Socratic idea to the full. The word for knowledge - *epistēmē* - can also more specifically mean ‘science’, and they regard each virtue as a genuine science, complete with its own constituent theorems. The skill of living in harmony is a skill analogous to, although vastly more

difficult than, any branch of mathematics or medicine.

Plato had given four virtues canonical status: justice, wisdom, temperance or self-control (*sōphrosynē*), and courage. The Stoics adopt this list, and treat all other virtues as subordinate species, or perhaps branches, of the four. Are these, then, four entirely distinct sciences? No. Among Socrates' most enduringly influential doctrines was that of the Unity of the Virtues. On one widely accepted version, adopted by some early Stoics (see Ariston of Chios §3; Cleanthes), Socrates' thesis meant that the four virtues are all simply one and the same state of mind, albeit going under different names in different external circumstances. Others took the view that the unity of the virtues consists rather in their inseparability. For example, you could hardly count as just if you were not brave and temperate too, or else you might be deflected from just behaviour through intimidation or bribery. It is perhaps this thought that led Chrysippus to the following view: the four virtues are four separate sciences, each with its own defining set of theorems; but each virtue incorporates and uses the theorems of the other three as subsidiary theorems. The thesis that the virtues are distinct sciences was put by Chrysippus, in the technical language of Stoic metaphysics (see §6), by saying that they belong to the second category, 'quality', and not the fourth category, 'relative disposition'. That is, they differ from each other as distinct qualities or states of mind, not simply as one state of mind differentiated by the varying external situations with which it is confronted.

17 The goal

The 'goal' or 'end' (*telos*) is defined as 'that for the sake of which everything is done, while it is not itself done for the sake of any further thing'. This is identified with happiness (*eudaimonia*), or 'living well'. Both are commonplace to the Greek philosophical tradition. The partisan content arises when philosophers offer their formulas for what this end actually consists in. Zeno's formula was 'living in agreement' (*homologoumenōs zēn*). The history of Stoic ethics over the next two centuries is largely a history of successive attempts to work out what Zeno must have meant.

Zeno's vagueness was probably deliberate. The 'agreement' comprises both the perfect internal coherence and rationality (the '*-log-*' part of *homologoumenōs* means 'reason') of the good life - 'living in accordance with one concordant reason' - and its conformity with nature, the 'nature' in question being itself equated with both one's own individual nature and the nature of the world. Happiness is also identified as a 'smooth flow of life', and Zeno's real point was that only those with complete understanding of cosmic rationality can make their own aims and choices entirely one with those of nature, and thus never come into conflict with either their own or the world's rationality.

Pressure for clarification led either Zeno himself or Cleanthes to make the first addition to the formula, which now became 'living in agreement *with nature*'. Chrysippus substituted 'living in accordance with experience of what happens by nature'. What became clearer, as these and other formulations competed, was that the ideal life was defined in terms of things which were themselves morally indifferent - the 'things which accord with nature' (see §15). The challenge which the Stoics faced from their opponents in the Academy was how moral good could depend on a set of aims whose attainment was morally indifferent. The answer - compare §15 - was as follows. What matters is not necessarily *achieving* natural advantages like health, which cannot be guaranteed in all circumstances, and which in any case do not bring happiness. What matters is making the right rational choices - doing everything that lies in your power towards achieving what nature recommends. It is the consistency of those *efforts*, not of their results, that may ultimately become perfect agreement with nature, that is, happiness. Formulas for the goal designed to capture this emphasis included (Diogenes of Babylon) 'reasoning well in the selection and disselection of things which accord with nature', and (Antipater) 'to live continuously selecting things which accord with nature and disselecting things contrary to nature'. Zeno's original formulation had more to recommend it.

18 The cosmic city

Everybody without exception strives for a good and happy life, but only the wise achieve it. Most people in fact misapply the very words 'good' and 'happiness', which they mistakenly associate with morally indifferent states like wealth and honour. This simple point came to be extended by the Stoics to all the other things which are conventionally prized. Everybody wants to be rich, free, powerful, beautiful, loveable, and so on, but, paradoxically, only the wise achieve these goals. Everyone else is, whatever they may think, actually poor,

enslaved, powerless, ugly and unloveable. This is because real wealth is to have something of genuine worth (that is, virtue), or to lack nothing that you need; real freedom is to be in full control of your life (including the knowledge of when to accept death rather than ever be forced to do what you do not truly want to do); real power is to be able to achieve everything you want; real beauty is a quality of the soul not the body; and only the genuinely beautiful are genuinely loveable. These Stoic 'paradoxes' are of Socratic inspiration.

A primary motif of Stoic political thought is the extension of such paradoxes into the civic realm. Conventional political ambitions belong to the realm of the indifferent just as much as wealth and health do. Thus, while Stoicism actively promotes conventional political activity as a way of following human nature, it at the same time downgrades it in relation to true moral goodness. Everybody wants to have power, and would like if they could to be a king; but only the wise have power (only they can achieve everything they want) and kingship (defined as 'rule which is accountable to no one'). These Socratic redefinitions were extended even to humbler civic aims: only the wise are generals, orators, magistrates, lawyers, and so on.

An upshot of this was a corresponding downgrading of the civic institution within which such offices operated. A city, in the conventional sense of a human cohabitation with geographical boundaries, a legal code and so on, is an artificial construct. A city in the most correct sense is not constrained in these ways: in fact the world itself is the ultimate city, being a habitation common to humans and gods, united by their shared rationality.

The idea was of Cynic inspiration. The Cynics had already coined the expression 'citizen of the world', *kosmou politēs*, which the Stoics took over. In a way every human being is a citizen of the world, and this generous version of Stoic cosmopolitanism was to become enormously influential on the ideology of the Roman Empire, as well as leading some Stoics to challenge entrenched gender and class barriers. But on a narrower criterion - influenced by Zeno's early utopian work the *Republic* (see Zeno of Citium) - it is not all human beings, but only the wise, who participate in the real cosmic city. The cosmic city has its own law, a natural moral law defined as 'right reason (*orthos logos*) which commands what should be done and forbids what should not'. This notion of a cosmic moral law which transcends local legal codes exerted a powerful influence on later theories of natural law.

Although the Stoics encouraged political involvement in conventional cities, and were themselves prepared to act as advisors to monarchs, there is little reason to think that any Stoic before the late second century BC (see Panaetius §2) made a serious contribution to non-utopian political theory.

19 Passions

Everyone who has not achieved virtue is in a state of vice or moral badness. Most commonly - for example, in the work of Plato and Aristotle - vice was viewed as a state in which reason is dominated and deflected by strong irrational emotions, or 'passions' (*pathē*, singular *pathos*). But Socrates had established an enduring intellectualist alternative, according to which the soul has no irrational parts, and virtue is knowledge, so that its lack, vice, is simply ignorance: 'No one does wrong willingly. The Stoics are fully committed to developing Socrates' position, in particular the thesis that passions are really value judgments.

A passion is commonly thought of as disobedient to reason. Reason says that you should face some danger, but fear disobeys. Reason chooses to abstain from embezzlement, but greed wins out. This suggests that an emotion can hardly itself be a rational state. The Stoics accept the description of emotions as 'disobedient to reason', but redescribe what this amounts to.

An emotion is primarily a judgment - a false one. A fear may be the false judgment that some impending thing, say injury, is bad for you. The falsity lies in the fact that physical injury is actually not bad, just a 'dispreferred indifferent' (see §15) and therefore strictly irrelevant to happiness. Your belief that it is bad takes the form of an 'excessive impulse' to avoid it, and that impulse, as well as being a judgment, is like any intellectual state also a physical modification (in this case called a 'contraction') of the *pneuma* that constitutes the commanding-faculty of your soul. The new overtensioned and perturbed state of your mental *pneuma* is one that you cannot instantly snap out of. Were you to entertain the correct judgment that you should not shrink from the danger, your *pneuma* would not be able to respond. That is what makes the passionate state of fear 'disobedient to reason' - a status it can have while itself also being a piece of faulty reasoning. Chrysippus compared it to a runner who is going too fast and therefore cannot stop at will. (For a later Stoic's disagreement with Chrysippus on this issue, see Posidonius §5.)

The four main kinds of emotion are appetite, fear, pleasure and distress. Appetite and fear are faulty evaluations of future things as good and bad respectively. Pleasure and distress are corresponding mis-evaluations of things already present. Each has a variety of sub-species, and one of particular importance in Stoic discussions (see Seneca, *On Anger*) is anger, identified as a species of desire, namely the desire for revenge. Calling pleasure a passion and a vice may sound harsh, but the kind of pleasure envisaged here is one involving conscious evaluative attitudes, such that its sub-species include gloating and self-gratification. ('Pleasure' understood as that sensation of wellbeing which automatically accompanies certain states and activities is not a vice but an 'indifferent'. It is the view that pleasure - in this latter sense - and pain are indifferent that has given 'stoical' its most familiar modern meaning.)

It should not be inferred that a Stoic sage is feelingless. The wise lack the 'passions', which are overevaluations, but they do instead have the correct affective states, which the Stoics call *eupatheiai*, or 'good feelings'. Thus the sage has no 'appetites', but does have 'wishes', whose species include kindness, generosity, warmth and affection. Similarly, instead of 'fear' the wise have 'watchfulness', and so on.

The Stoics' conviction that emotional states, far from being mere irrational drives, are primarily specified by their cognitive content is one of their most valuable contributions to moral philosophy. Its most important implication in their eyes is that philosophical understanding is the best and perhaps the only remedy for emotional disquiet. In the short term strong emotions are disobedient to correct reasoning, but in the long term rational therapy can restructure the intellect and dispel all passions (see Emotions, nature of).

20 Fate

Socrates had been a firm believer in the powers of divination and in divine providence. Stoicism took over this outlook and developed it into a doctrine of 'fate' (*heimarmenē*), which by the time of Chrysippus had become a full-scale thesis of determinism.

That everything that happens is predetermined is a thesis which flows easily from all three branches of Stoic philosophy. Ethics locates human happiness in willing conformity to a pre-ordained plan (§17), and treats the use of divination as a legitimate means towards this goal. Physics provides the theory of the world's divinely planned cyclical recurrence, unvarying in order to maintain its own perfection (§5).

Physics also supplies a fundamental principle, regarded as conceptually self-evident, that nothing happens without a cause. This quickly leads to the conclusion that the world's entire history is an unbroken causal network. 'Fate is a natural everlasting ordering of the whole: one set of things follows on and succeeds another, and the interconnection is inviolable'. 'The passage of time is like the unwinding of a rope, bringing about nothing new and unrolling each stage in its turn.' A modern analogy might be the continual rerunning of a film.

Finally, logic offers the principle of bivalence: every proposition, including those about the future, is either true or false. Therefore, Chrysippus argued, it is true *now* of any given future event either that it will happen or that it will not happen. What does that present truth consist in? It can only lie in the causes now present, sufficient either to bring the event about or to prevent its happening. Therefore all events are predetermined by antecedent causes sufficient to bring them about and to prevent all alternatives from occurring. (Compare Aristotle §20 and Epicureanism §12, for escape routes from this argument.)

21 Responsibility

The greatest interest of this determinist position lies in the Stoics' attempts to meet the challenge it poses to moral responsibility (see Free will). They implicitly accept that a person is responsible for an action only if they could have done otherwise. But how could this latter be true in a Stoic world, where the actual action performed is causally determined and even predictable in advance? Chrysippus was the author of the main Stoic answers to this challenge. His task (see Cicero, *On Fate*) was to show that even in such a world 'could have done otherwise' makes sense: an action which I did not in the event perform may nevertheless have been *possible* for me, that is, my failure to perform it was not *necessary*. The strategy for securing this result included the following lines of argument.

(1) A 'possible' proposition is defined in Stoic sources as 'one which (i) admits of being true, and (ii) is not

prevented by external circumstances from being true'. Suppose that you have failed to pay a bill despite having the cash. Paying the bill was 'possible' for you. (i) It 'admits of being true': there is such a thing as paying a bill, unlike for example, being in two places at once. (ii) Nothing external to you prevented you: you did not lack the funds, you were not forcibly detained, and so forth. This account of possibility does allow that something *internal* to you may (indeed must) have prevented you from paying: for example, your meanness, forgetfulness or laziness. Still, it was possible for you to pay, in the sense that you had the *opportunity* to pay. Chrysippus seems to maintain that the 'could have done otherwise' notion of responsibility holds in his world, because alternative actions are 'possible' in just this sense: we regularly have the opportunity to do otherwise, and therefore have only ourselves to blame for what we actually do.

Stoicism resists the alternative that 'could have done otherwise' might entail our being actually *capable* of acting otherwise: surely the good, in order to claim credit for their conduct, do not have to be capable of wrongdoing, nor need the bad, if they are to be blamed, be capable of acting well.

(2) Much this same point was also expressed in terms of a causal distinction (one among many: the Stoics were accused of introducing a 'swarm of causes'). When a cylinder is pushed and rolls, the 'principal' cause of the rolling is its shape, the push being just the triggering or 'proximate' cause. From our point of view as agents, Chrysippus argues, fate functions as a series of mere triggering causes - the openings, provocations and so on with which the world presents us. Given our respective states of character, we are bound to respond to these prompts in just the ways we do. But the principal cause lies in our character. And that makes us, not fate, responsible for our actions.

Importantly, the Greek word for a cause, *aition*, literally means the 'thing responsible'. However, the Stoics' technical term for moral responsibility is *eph' hēmin*: our actions are 'within our power'. This is not a thesis of free will. What matters to them is not to posit an open future, but to establish the moral accountability of human action even within a rigid causal nexus.

(3) Divination might be thought to make the future necessary. Take an astrological law: if you were born at the rising of the dog star, you will not die at sea. Suppose you *were* born at the rising of the dog star. This is an unalterable fact about the past, and therefore, Chrysippus accepts, necessary. There is also a widely accepted law of logic that if the antecedent of a conditional is necessary so is its consequent. Therefore 'You will not die at sea' also becomes a necessary truth. One of Chrysippus' replies was that divinatory laws do not express conceptually indubitable truths, and are therefore not properly expressed as conditionals, but rather as negated conjunctions (see §11), in which this transmission of necessity does not occur.

(4) One remaining challenge was the Lazy Argument. Why, its proponents asked, should we bother to make decisions if the outcome is already fixed? Why call the doctor, if whether you will die or recover from your illness is already fated? Chrysippus' answer is that such sequences of events as calling the doctor and recovering are 'co-fated'. In most cases the outcome is fated *via* the means, not regardless of them.

Some landmark events, however, such as the day of your death, may be fated regardless of the means. Your character will cause you to decline numerous alternative actions to those you will choose, but even if, counterfactually, you were going to choose one of those alternatives, it would still be going to lead to your death on that same day. For example Socrates (in Plato's *Crito*) knew through a prophetic dream that he would die in three days' time, and his reasoned decision to stay and accept execution was willing cooperation with the rational world plan, where a bad person would have resisted by escaping but still died on that same fated day. Zeno and Chrysippus compared a human being to a dog tied to a cart: it can follow willingly, or be dragged.

In this way, morality is not simply argued to be compatible with determinism, but to require it. Only within a framework of rational predestination can moral choices have their true significance. There remains, however, the question why, in a world where it was pre-ordained that we would be precisely the kind of people we are, our choices should have any moral significance at all. The answer is that goodness belongs primarily to the world as a whole (identifiable with god). It is from this that moral qualities filter down to individuals and their actions, as a measure of their cooperation with or obstruction of the rational world plan.

22 Later fortunes

Stoicism's success ran high in the first century AD. It was perceived by writers like Seneca and Lucan as embodying the traditional Roman virtues whose decline was so widely lamented. Roman Stoics formed the main resistance to the emperor's rule, and, following the earlier model of the Stoic Cato, made the principled act of suicide into a virtual art form.

In a way Stoicism's crowning achievement was in AD 161, when its adherent Marcus Aurelius became Roman emperor. Here at last was a genuine philosopher-ruler. When Marcus established chairs of philosophy at Athens, these included one of Stoic philosophy. Nevertheless, Stoicism was already on the decline in the late second century, eclipsed by the revived philosophies of Plato and Aristotle. By then, however, it had entered the intellectual bloodstream of the ancient world, where its concepts remained pervasive in such diverse disciplines as grammar, rhetoric and law, as well as strongly influencing the thought of Platonist philosophers like Porphyry, and Church Fathers such as Clement of Alexandria.

Through the writings of Cicero (whose philosophical works, although not Stoic, embody much Stoicism) and Seneca, Stoic moral and political thought exercised a pivotal influence throughout the Renaissance (see Renaissance philosophy). Early modern philosophers who incorporated substantial Stoic ethical ideas include Spinoza and Kant. The recovery of Stoic physics, epistemology and logic, however, has been largely an achievement of the nineteenth and twentieth centuries.

Strato (d. *c*.269 BC)

The third head of Aristotle's school, from c.*287 to* c.*269 BC, Strato has been regarded as substituting materialism for Aristotelian metaphysics, mechanism for teleology, atheism for theology and empiricism for intuition; and he has been blamed for the decline of Aristotle's school, or (less often) praised for his adoption of a more scientific outlook, especially in psychology. However, on some issues at least it may be more a matter of a selective emphasis of certain parts of Aristotle's teachings than of conscious and deliberate anti-Aristotelianism. None of Strato's writings survives.*

1 General

Strato, whose date of birth is unknown, was the third head of the Lyceum, the school founded by Aristotle. After teaching the future king Ptolemy II Philadelphus in Alexandria, he succeeded Theophrastus (§1) as head of the school on the latter's death *c*.287 BC and remained in office until his own death eighteen years later. In some respects the most innovative and original member of the school after Aristotle, he has been held responsible for its subsequent decline, on the grounds that he abandoned certain Aristotelian doctrines; but there is room for debate both about Strato's actual views - given our complete dependence on second-hand reports - and about their relation to Aristotle's (see Peripatetics).

Where logic and ethics are concerned we know little of the contents of Strato's works, as opposed to their titles, and according to Cicero his interest in ethics was slight (frs12-13, Wehrli 1969); these reports must be read in the context of the perspective on the history of philosophy which Cicero derived from Antiochus, but may still be accurate enough as to the actual facts. Indeed Strato was often referred to by ancient sources as 'Strato the natural philosopher' (*ho physikos*).

2 Mechanism

Strato has often been interpreted both as a materialist and mechanist; in the eighteenth century 'Stratonist' was applied to those who denied divine influence on processes in the natural world. Purpose and form are connected in Aristotle, and Strato was supposed to differ from him on both issues. Certainly Strato (like Theophrastus before him, as far as our evidence goes) shows little interest in the role of the formal cause or in such issues as the status of universals, and is more concerned with the interactions of the elements than the division into matter and form. He regarded heat and cold as the fundamental principles of physical change (frs 42-8, Wehrli 1969), following Aristotle (*Generation and Corruption* II.2). The influence of Strato's approach can be seen in works attributed to Aristotle but in fact written in the third century, such as the *Problems*, the *Mechanics* and *On Things Heard* (*De audibilibus*).

That Strato rejected teleological explanations as a matter of principle, however, is less certain. Cicero reports him as saying that things are created by natural weights and movements, not by god (fr. 32, Wehrli) and as placing in nature a divine power which causes coming-to-be, growth and decay but lacks consciousness and form or shape - Latin *sensus* and *figura* - which in the context probably means, as Repici (1988) has argued, that it is not an anthropomorphic divinity (fr. 33, Wehrli 1969, see also frs 34, 36, 37). None of this sounds un-Aristotelian; Aristotle himself does not hold that things are created by god rather than by natural processes, does not regard nature as a conscious force, and shows in his zoological works how purpose and necessity work together for the most part but not always. Plutarch attributes to Strato (fr. 35, Wehrli 1969) the view not only that the world is not a living creature (where Aristotle, again, would agree; *On the Heaven* II.2, sometimes appealed to for the contrary view, is in fact concerned with the heaven, not the whole world), but also that chance (or 'the spontaneous': *to automaton*) is primary, nature secondary; this has been explained by scholars as a distortion resulting from Plutarch's desire, in the context, to stress Strato's disagreement with Platonism, or as indicating that, while processes in the world are brought about by nature, there is no further source or explanation of the existence of movement in the world as a whole, such as the Unmoved Mover provides in Aristotle's theory.

We have, indeed, no instances of Strato's actually using teleological explanations of nature; but our evidence is scanty in any case. It may be appropriate to speak, not of a rejection of Aristotelian positions by Strato, but of a selective emphasis on certain aspects of Aristotle's teaching rather than others. Strato almost certainly rejected

Aristotle's doctrine of the Unmoved Mover, which Theophrastus had questioned and which Aristotle had not held throughout his career. He also (fr. 84, Wehrli 1969) rejected the fifth element, the incorruptible *aithēr* of which Aristotle held the heavens were made.

3 Microvoid and *horror vacui*

In the physics of the sublunary world Strato's greatest innovation was his readiness to allow the temporary existence of imperceptibly small and completely empty void spaces - 'microvoids' - within material bodies (frs 54-67, Wehrli 1969), using this to explain the compressibility of bodies and penetration, such as that of light through water. The idea that penetration of one body by another is to be explained in terms of 'pores' or passages is already present in Theophrastus and in book IV of Aristotle's *Meteorology* (which some have, questionably, attributed to Strato himself or to Theophrastus, rather than to Aristotle), but here the pores seem not to be void but to be filled with a substance different from that surrounding them. (Gatzemeier's (1970) view that no more than such a theory of *potential* void was to be attributed to Strato has been refuted by Furley (1985).) Where Aristotle had held that light was propagated as a change in a medium, Strato regarded light-rays as material.

There is no direct evidence for Strato's use of the principle of 'nature abhorring a vacuum' (henceforth *horror vacui*); fr. 5 (Gottschalk (1965)), from Theophrastus' *Meteorology* on the motion of the winds, is claimed for Strato rather than Theophrastus by Gottschalk, but the attribution has subsequently been challenged. The doctrines of *horror vacui* and of microvoids are logically distinct; but it seems likely that Strato combined them, by relating *horror vacui* only to a 'massed' or 'perceptible' vacuum. Such a connection was made by the Alexandrian physician Erasistratus, who had been a pupil of Theophrastus - like Strato - and used *horror vacui* to explain physiological processes (see Helllenistic medical epistemology §1); it also appears in the *Pneumatics* of the first-century AD technological writer Hero of Alexandria, where the influence of Strato is present though its extent is uncertain. But Strato's theory is in any case far removed from the atomist conception of discrete particles of matter moving within an otherwise empty space, and of indivisible minima of extension (see Epicureanism §§2-3; (Atomism, ancient).

4 Time, place, motion

Strato rejected Aristotle's view of time as the numbered aspect of motion, arguing that motion and time are continuous whereas number is discrete; the disagreement with Aristotle concerns the implications of 'numbered' rather than the actual continuity of time. Similarly, in defining time as quantity or measure both in motion and in rest, Strato may be differing from Aristotle more in the formulation than in the underlying doctrine (see also frs 75-9, Wehrli 1969). Strato rejected Aristotle's view of place as 'the first unmoved boundary of what surrounds', and defined it instead as the interval or extension delimited by the outermost surface of what is contained or the innermost surface of what contains it - which amounts to saying that the place of a thing is, not as for Aristotle what bounds it, but the space that it occupies (see also frs 55, 59-60, Wehrli 1969; Gottschalk 1965: 169). Unlike Aristotle, but like the Stoics, Strato held that all four elements, earth, air, fire and water, naturally move to the centre of the universe (frs 50-2, Wehrli 1969). He agreed with Aristotle that falling heavy bodies accelerate, and demonstrated this, in a notable combination of reasoning and empirical observation, from the facts that water which falls as a continuous stream breaks into separate droplets further down, and that a body dropped from a height makes an impression in the earth which it does not if dropped from a short distance (fr. 73, Wehrli 1969).

5 Soul

Strato emphasized the role of *pneuma*, 'breath' or 'spirit' (see Pneuma), in the functioning of the soul (see Psychē). Aristotle and Theophrastus had used *pneuma* to explain bodily processes, but it is debated how far they had identified specific channels through which it functioned. For Strato (frs 119-20, Wehrli 1969) soul-activities were explained by *pneuma* extending throughout the body; the 'ruling part' *(hēgemonikon)* he located (perhaps not under that name, which is Stoic) not in the chest, as in Epicureanism and Stoicism, but in the head, more precisely in the space between the eyebrows. Tertullian illustrates Strato's theory with the analogy of air in a musical pipe (Strato fr. 108, Wehrli 1969), the point in the context being that the same air can function in different ways; but he attributes the analogy also to Heraclitus and Aenesidemus. Strato may have been influenced in his theory of *pneuma* by developments in contemporary medicine and anatomy; Erasistratus investigated the function of the nerves by dissection and argued that they contained 'psychic' *pneuma* extending from the brain. But there is no

explicit evidence that Strato himself linked *pneuma* with the nerves. Sensation was actually felt, he argued, in the ruling part of the soul, rather than in the bodily extremities (frs 110-11, Wehrli 1969).

For Strato, all sensation involved thought (fr. 112, Wehrli 1969, noting what happens if our attention wanders while reading). Conversely, there is no thought not derived from sensation (fr.74, Wehrli 1969). Sextus Empiricus goes further and says that for Strato sensation and thought (*dianoia*) were identical (fr.109, Wehrli 1969), but this is an oversimplification; for Strato thought is *based on* sensation (and for Aristotle too it depends on images; *On the Soul* 432a13-14). Epiphanius' claim that for Strato (fr. 48, Wehrli 1969) every living creature was capable of thought may be as unreliable as many of his other statements. Plutarch too cites the claim that all sensation involves thought (fr. 112, Wehrli 1969) in the context of animal intelligence, though there is nothing in the report itself to suggest this. Strato's emphasis on *pneuma* as the means through which soul functions is a development, not a rejection, of Aristotle's own (arguably functionalist) view of soul as form. There is no place in Strato's theory of soul for the individual soul conceived as form separable, at least in part, from the body; but this is not the only possible interpretation of Aristotle's own position, even if many have adopted it for Platonizing, theological or anti-materialist reasons of their own. Strato brought some highly pertinent criticisms (frs 122-7, Wehrli 1969) against Plato's arguments for immortality in the *Phaedo*, pointing out for example that the fact that a soul cannot be dead does not show that the soul is everlasting.

6 Scientific method

In criticizing Plato's arguments for immortality Strato contrasted demonstrative argument with the Platonic theory of recollection (see Plato §§11, 13) to the disadvantage of the latter (frs 125-6, Wehrli 1969; fr. 14b, Gottschalk 1965). Isnardi Parente (1991) connects this with Strato's use of experimental method and with Hero's reporting that microvoid is shown to exist by 'demonstration from sense-perception' (*aisthētikēapodeixis*, Strato fr.1a p.112.13, Gottschalk 1965). Although the connection of the latter passage with Strato is not certain, this reconstruction of a Stratonian epistemology which based demonstrative argument on empiricist foundations, and which was influential for Hellenistic science (see Hellenistic medical epistemology), is plausible enough. However, the contrast often drawn in this respect between Aristotle himself and Strato depends on the questionable attribution to the former of a belief in intuition as a mode of cognition independent of the senses (see Aristotle §6).

Strauss, David Friedrich (1808-74)

The Christian faith rests upon two major beliefs: the existence of a God who created the universe, and the claim that in the historical person of Jesus of Nazareth this God in a unique way entered into world history. Like the two foci of an ellipse, these beliefs, which may be designated the metaphysical and the historical, constitute the fundamental foundation of the Christian faith. Strauss was the first major theological figure to openly challenge this foundation. The revolutionary Das Leben Jesu (Life of Jesus), which appeared in 1835, was Strauss' attempt to disprove these two fundamental beliefs from a point of view which no longer accepted the old orthodox dogmas. As an alternative explanation to a divine Christ, Strauss posited a mythological Jesus; in his lifelong search to find a substitute for theism, Strauss moved through a philosophy of nature to Hegelianism, atheism and finally Darwinism.

1 *Life of Jesus*

David Friedrich Strauss was born in the town of Ludwigsburg, a few miles north of Stuttgart, in the province of Württemberg, on 27 January 1808. He studied theology at the University of Tübingen (one of his teachers being Ferdinand Christian Baur), and also devoted considerable time to philosophy. He found Kant too involved and difficult to understand. Romanticism was the ruling sentiment of the day, and Strauss enthusiastically embraced the works of Goethe, Schiller and other Romantics of the age. But the leading philosopher of Romanticism at that time was Schelling, whose pantheistic philosophy of nature Strauss eagerly absorbed (see Schelling, F.W.J. §1). In doing so he rejected the idea of a God who was both transcendent and personal. 'I have still not been able to convince myself of the personality of God, as it is found in theism', he wrote to a friend. 'In that teaching God is a personal, self-conscious God; the consciousness, however, is nothing other than the expression of a particular life of the Spirit which develops *in time*' (1851 (Harris 1973: 11)).

It was in 1828 that Strauss first began a serious study of Hegel's *Phenomenology*. What drew him most of all to Hegel was the alternative explanation which Hegel provided for the creating source behind the universe - a God who was not the three-person Creator of the Bible, but an unconscious Spirit which in a threefold process enters into history, becomes conscious, and returns to itself as the Absolute Spirit (see Hegel, G.W.F. §8). In 1831 Strauss travelled to Berlin, hoping to attend lectures from Hegel himself. He did indeed meet the Master, but after attending two lectures was informed by Schleiermacher that Hegel had died of cholera on the previous day. Strauss decided to remain in Berlin, and it was at this time he conceived his plan for a 'Life of Jesus' in which the Gospels would be interpreted from a new philosophical viewpoint.

In his investigation of the New Testament, Strauss' primary concern was to evaluate the Gospels as *historical* documents, going behind the supernatural elements to arrive at the historical truth lying behind the sources. Here he had first to make the determining assumption that everything supernatural was *ipso facto* unhistorical and unauthentic. For he perceived that to allow even one supernatural element to remain would vitiate the philosophical framework he envisaged. Therefore, the interpretation was above all 'a-theistic', meaning that a supernatural God (if existent) was excluded from the reckoning, without there being any explicit *denial* that such a God existed (the atheistic interpretation). This a-theistic or purely historical viewpoint, later also espoused by Baur (who after 1835 became the leading Hegelian theologian), may be called the Tübingen theological perspective. Strauss was the first to apply this a-theistic viewpoint openly and consistently to the whole of the New Testament, and not just piecemeal to certain isolated passages. From this point, Strauss abandoned the supernatural element completely in favour of the philosophical principle that in history only the rational is real and the real rational.

Strauss was not the first to interpret the Biblical narratives in this way. The rationalists, pre-eminent among them H.E.G. Paulus, had sought to explain miracles without recourse to the supernatural. But what was new in Strauss was a completely different method of interpreting the historical element. The rationalists had explained each miracle by a variety of natural causes; H.S. Reimarus had accused the Biblical authors of conscious fabrication. But Strauss was the first to interpret the Gospel narratives as a whole neither by rationalism nor by fraud, but by a new explanation called the 'mythological' interpretation, in which he claimed that the Biblical writers *unconsciously* presupposed miraculous events in the life of Christ on the ground of supposed prophecies in the Old Testament. Thus, according to Strauss, the accounts of miracles in the Gospels were simply creations in the minds

of the Gospel writers, who reasoned that since such miracles and events were predicted in the Old Testament, then they must have happened, and accordingly represented them as having so happened.

These were the interpretive principles which Strauss used, and they were thus far quite independent of his Hegelian views. But when it came to explaining positively what had actually happened - for Strauss did not deny that there was a historical person called Jesus - he employed his Hegelian philosophical viewpoint. Jesus was the God-man, not in the old traditional sense of an actual unity between the divine Son of God (the second person of the Trinity) and the human body which he adopted through the virgin birth, but in the sense that the man Jesus was simply the representation of what every man actually was, the unity of the divine and human in every personality. ‘The infinite Spirit is real only when it discloses itself in finite spirits, just as the finite spirit is true only when it merges itself in the infinite. The true and real existence of the Spirit, therefore, is neither God by himself, nor man by himself, but the God-man’ ([1835-6] 1972: 777). As such everyone is a God-man, and Jesus is simply on a higher level with other men of genius, such as Napoleon, Goethe, Raphael and Mozart, with the distinction that the religious genius occupies a higher place, since the divine Spirit is present in this form of consciousness directly, and not merely indirectly.

These, then, were essentially the views which in 1835 caused an uproar in the theological circles of Germany. ‘The book stood there’, wrote the Hegelian Karl Schwarz, ‘with the hard indifference of fate; it was the final account drawn up in the criticism of the Gospel history, and the inventory read: Bankrupt! For this reason the effect of the work was enormous. An electric shock ripped through the whole of German theology’ (1869: 97). In Britain the book was translated into English by the young Mary Ann Evans, later to achieve fame as the novelist George Eliot.

Reaction was not long in following. Strauss was dismissed from his position as tutor in the Tübingen Seminary. For a time he taught classical languages in the school at Ludwigsburg. An attempt by the new democratic government at Zurich to appoint him professor of theology aroused such strong opposition throughout the Canton that he had to be pensioned off without having set foot in the city; the pension, however, secured his financial independence. Marriage to a famous singer, Agnese Schebest, in 1842, brought him only temporary happiness, a divorce being agreed five years later. In 1848, following the revolution, Strauss was appointed to the Württemberg Parliament as the liberal candidate for Ludwigsburg, but he could not agree with the radical majority and after a few months handed in his resignation.

2 Later works

For some years Strauss devoted his time to literary works, producing biographies and sketches of lesser known historical figures. A new version of the *Life of Jesus* was published in 1864, *Das Leben Jesu für das deutsche Volk bearbeitet (A New Life of Jesus)*, in which Strauss followed the same a-theistic approach, but abandoned his Hegelian reconstruction of the person of Jesus. In 1872 his final work was published, *Der alte und der neue Glaube (The Old and the New Faith)*, in which he espoused the new evolutionary views of Charles Darwin - the first theologian to do so. Thirty-seven years had passed since he had written his first *Life of Jesus* and his philosophical views had undergone a great change; no longer did he hold the Hegelian ideas he had endorsed in his youth. In the 1840s the Hegelian bubble had burst (see Hegelianism §2). Baur’s pupils, Strauss, Eduard Zeller, Albrecht Ritschl and others, had all slowly abandoned the Hegelian rhetoric. Ludwig Feuerbach (§2) drove the final nail into the Hegelian coffin, declaring that such metaphysical ideas were simply so much verbiage; finally Baur himself discarded his former Hegelian convictions. Feuerbach had convincingly demonstrated that there was no absolute, infinite Spirit; such ideas were just the projection of man’s mind into space. The secret of theology was nothing but anthropology; the knowledge of God nothing more than the knowledge of man! All Hegel’s metaphysical ponderings were in the end just grandiose illusions. What remained was nothing but man himself.

But where had the universe come from? Where had humankind come from? Strauss’ examination of the various possibilities began with Schopenhauer’s unconscious primeval Will, which evolved through consciousness and intelligence, through the plant and animal world, to humankind itself as the highest manifestation of that Will (see Schopenhauer, A. §§3-4). Eduard von Hartmann developed these ideas further, and asserted that everything must have originated from the Unconscious, for if God was conscious and aware of what he was doing when he created the world, then his creation would be an enormous and inexpiable crime. Strauss was fascinated by these solutions, and though he did not accept all of Schopenhauer’s ideas and was extremely critical of Hartmann, he saw in the evolutionary process the key for which he was looking in order to unlock the riddle of the universe. In Darwin’s

natural selection he found the confirmation he was seeking. In that direction lay the way the train of scientific thinking would go.

In espousing evolution and Darwin, Strauss was criticized by many of his supporters, but his keen sense of logic and consistency have certainly been vindicated by the twentieth-century acceptance of the evolutionary viewpoint. In adopting this viewpoint Strauss was, as always, ahead of the radical thinking of his time. The book went through six large editions in a year, a success which had never before attended any theological or philosophical work in Germany. Even Nietzsche's vituperative and rude attack in the following year (Nietzsche looked upon Strauss as a representative of a decrepit, bourgeois culture and morality) could not significantly detract from the enormous popularity the book had enjoyed (see Nietzsche, F.).

Strauss died two years later on 8 February 1874, having expressly forbidden a Christian funeral. His first *Life of Jesus* set in motion the whole 'quest' for the historical Jesus, which sought to discover the true Jesus of history stripped of his supernatural features. Strauss' criticism of the Gospel sources also provided the foundation on which Baur built up the historical criticism of the New Testament, with other scholars working on parallel lines in the Old Testament. Rudolf Bultmann's later demythologization of the New Testament, where everything supernatural is regarded as mythical, is simply a modern extension of Strauss' work (see Bultmann, R.). Strauss has no 'followers' as such today, but his a-theistic principles and views in various ways have permeated and influenced almost every area of theological scholarship.

Strauss, Leo (1899-1973)

Leo Strauss was a German-Jewish émigré political philosopher and historian of political thought, who wrote some fifteen books and eighty articles on the history of political thought from Socrates to Nietzsche. Strauss was no ordinary historian of ideas; he used the history of thought as a vehicle for expressing his own ideas. In his writings, he contrasted the wisdom of ancient philosophers such as Plato and Aristotle with the foolhardiness of modern philosophers such as Hobbes and Locke. He thought that the loss of ancient wisdom was the reason for the 'crisis of the West' - an expression that was in part a reference to the barbarities of the Holocaust. He therefore sought to recover the lost wisdom. He studied the classics and was a great devotee of Plato and Aristotle. However, he developed unusual interpretations of classical texts.

Strauss was born in Kirchhain, Hessen, Germany. He studied at the Universities of Marburg and Hamburg where he came into contact with Edmund Husserl and the young Martin Heidegger. He left Germany in 1932 and eventually settled in the USA where from 1949 to 1968 he was professor of political science at the University of Chicago. He amassed a sizeable following of devoted students, who have played a significant role in US academic life and government.

According to Strauss, the fundamental issue that divides ancient and modern thinkers is the relative importance of reason and revelation in human life. Modern philosophers such as Hobbes (§§6-7) and Locke (§10), exalt reason and believe that a political order can be founded on purely rational and secular principles. But Strauss believed that this modern liberal project was doomed to failure. He thought that reason cannot provide the requisite support for moral and political life; what is needed is belief in a transcendent God who punishes the wicked and rewards the righteous. Strauss thought that ancient philosophers understood this very well and that modern philosophers were seriously misguided in thinking that rational self-interest was a sufficient ground of social life. In Strauss' view, the modern faith in reason is at the heart of the 'crisis of the West'. Reason has destroyed faith and in so doing has opened the door to barbarism. Ancient philosophers understood that reason and philosophy have a corrosive effect on the 'city', as Strauss called the state. By the same token, Strauss was committed to philosophy and had no intention of denouncing it out of hand. He therefore argued that philosophy must be kept hidden or secret, not simply to permit philosophers to avoid persecution, but for the sake of the people and the for wellbeing of the city.

In *Persecution and the Art of Writing* (1952), a paradigmatic work, Strauss argued that all the great philosophers of the past understood the dangers involved in their own philosophical activity. Accordingly, they peppered their work with riddles, hints, clues, allusions, confusing language, intentional contradictions and other forms of subterfuge designed to conceal their true thoughts. Strauss argued that every great book contained a dual teaching: an exoteric or public teaching and an esoteric or private message. The former was a salutary teaching or noble lie intended for the consumption of the many while the latter was the dangerous truth intended only for the few.

Strauss' discovery of esotericism led him to advance unusual interpretations of classic texts. For example, Strauss argued that Plato (§4) wrote dialogues in order to conceal his true thinking. And contrary to popular belief, Strauss denied that Socrates was Plato's mouthpiece. He thought that in *Republic* Thrasymachus, not Socrates, was Plato's true spokesman (Strauss 1964: 77). According to Strauss, the argument made by Socrates was simply Plato's exoteric teaching. In arguing that justice leads to happiness, Socrates was displaying his sophistic skill - that is to say, his ability to make the weaker argument appear the better. Strauss thought that the Socratic argument in favour of justice could not succeed. He was certain that Plato was wise enough to realize that Thrasymachus was right - that justice is a function of power, and that in acting justly one serves the interest of others and not oneself. Strauss surmised that Socrates must have taken Thrasymachus aside and explained to him that his views were true, but too dangerous to express publicly. In this way, Socrates managed to silence Thrasymachus without refuting him. For Strauss, the truth is a luxury meant only for the few who hunger for the reality behind the necessary myths and illusions of the city.

Strauss insists that although the truth is dark, even 'sordid', it is still the erotic object of the philosopher's quest. However, it would seem that if we accept Nietzsche's premises, we must also accept his conclusion - if the truth is dark, then we must renounce it and live according to the humanizing illusions, the life-giving myths we create for

ourselves. By accepting Nietzsche's premises and rejecting his conclusion, Strauss cultivates an elite that is more vulgar than wise (see Nietzsche, F.).

The devotion of Strauss' followers, coupled with his esotericism, has made him a figure of some controversy. But one thing is clear, Strauss' followers regard US liberalism as the embodiment of the legacy of modernity and its attendant dangers, and their aim is to rescue the USA from such modernity. Strauss taught them that this would be possible if they could win the ear of the powerful, hence their interest in government and public policy. Some find Strauss' elitism disconcerting. An elite that is radical, secretive and duplicitous, an elite that exempts itself from the moral principles it deems applicable to the rest of humanity, cannot be trusted with political power.

Strawson, Peter Frederick (1919-)

Strawson taught at the University of Oxford from 1947, becoming Waynflete Professor of Metaphysical Philosophy in 1968, and retiring in 1987. A sequence of influential books and articles established him as one of the leading philosophers in Oxford during that period. He had a crucial role in the transition there from the dominance of Austin and linguistic philosophy in the 1950s to the more liberal and metaphysical approaches in the 1960s and later. The principal topics about which he has written are the philosophy of language, metaphysics, epistemology and the history of philosophy.

Strawson became famous with 'On Referring' *(1950), in which he criticized Russell for misconstruing our ordinary use of definite descriptions. Strawson endorses the slogan 'ordinary language has no exact logic', a viewpoint which is explored in* Introduction to Logical Theory *(1952). He argues that the utility of formal logic in its application to ordinary speech does not imply that the meaning of ordinary language is captured by the semantics of standard formal systems.*

In Individuals *(1959), Strawson's most discussed work, his task is descriptive metaphysics. He attempts to describe the referentially basic subject matter of our thought. They are relatively enduring, perceptible and reidentifiable bodies. The other element in the basic framework is what Strawson calls persons, enduring entities with both material and psychological features. In* The Bounds of Sense *(1966), Strawson continued the development of his metaphysical and epistemological ideas, by combining a critical study of Kant's Critique of Pure Reason, with the defence of some transcendental claims similar to Kant's. To think of oneself as an enduring subject of experience requires that one recognize objects which are independent of oneself. So the major epistemological problem in the empiricist tradition, of building up to the external world from private experiences, cannot arise.*

Skepticism and Naturalism; Some Varieties *(1985a) studies the conflicts between fundamental opinions which are natural to us, such as that we know things, and philosophical viewpoints claiming that these opinions are mistaken. Strawson argues that scepticism about these natural views can and should be resisted. Throughout his career, Strawson has tried to describe the basic content of our thoughts and experiences, to counter scepticism about or revisions of such thoughts, to illuminate them by making analytical connections between their basic elements, as well as investigating language, our vehicle for expressing these thoughts. He has linked his explorations to the insights of philosophers of the past, while engaging in critical debate with the period's other leading philosophers, such as Austin, Quine, Davidson and Dummett.*

1 Life

Peter Frederick Strawson was born in London in 1919. He was educated at St John's College, Oxford, and, in 1948, became a Fellow at University College, Oxford, until, in 1968, he succeeded Gilbert Ryle as Waynflete Professor of Metaphysical Philosophy. He was knighted in 1977 and retired in 1987.

2 'On Referring'

The theory of reference has been central to the philosophy of language. Strawson initiated the debate about definite descriptions and has made a developing contribution to that debate and to one about proper names.

'On Referring' (1950) is one of Strawson's most discussed and influential articles. The target is Russell's theory of definite descriptions (see Russell, B.A.W. §9). According to it, a sentence of the form 'The F is G' (which I shall call 'S') is equivalent to 'there is an F, and only one F, and it is G' (which I shall call S*). Strawson argues that S is importantly different from S*. Thus, if there is no F then S* is false; whereas for S, in these circumstances, the question of its truth or falsity does not arise. Further, S* says that there only one F, whereas utterances of S do not claim that there is only one F, since it is quite possible to say 'The car won't start', despite there being lots of cars. Strawson suggests that a sentence like S has a context-independent meaning, but when used in the right context, 'The F' is used referentially, being somewhat similar to 'That F'.

The paper inspired an enormous debate. It was disputed (1) whether there are truth-value gaps, that is whether uses of S where there is no F are neither true nor false, and (2) whether Strawson's proposal fits many sentences containing 'the'. Strawson subsequently introduced the important concept of 'identifying reference'

('Identifying Reference and Truth Values' in *Logico-Linguistic Papers*). Roughly, hearers have knowledge of many objects around them. Speakers employ definite descriptions (at least sometimes), in identifying reference, when they exploit this knowledge to enable the hearer to know which object is being spoken of. According to Strawson, Russell's fundamental mistake is to deny this role to definite descriptions. Strawson also separates the issue of the validity of the notion of identifying reference from the issue of truth-value gaps, by allowing that whether there is a gap is influenced by other aspects of a speech situation (see Descriptions) (Neale 1990).

3 Logic and language

Introduction to Logical Theory (1952) is Strawson's first book. It aims, first, to explain standard formal logic. Second, it aims to give philosophical elucidations to some notions which logicians employ, crucially inconsistency. Third, and most originally, it aims to determine the relation between formal logic and ordinary language.

Strawson argues that logical appraisal applies to statements (singly or in groups) and not to sentences, because in different contexts individual sentences make different claims. He takes the notion of inconsistency as basic, one in terms of which to explain others, such as entailment. Inconsistency is itself explained by 'our own determination of the limits of application of words' (1952: 9). Strawson therefore adopts, and tries to elucidate, the view that entailments are, in some sense, linguistically grounded.

The most original aspect of the work is its discussion of logical constants and other elements of ordinary language. I shall mention two points. First, in Chapter 6, he introduces the notion of 'presupposition', to be distinguished from entailment. Roughly, S presupposes S* if the truth of S* is a necessary condition of the truth or falsity of S, whereas S entails S* if the truth of S* is a necessary condition for only the truth of S. This notion enables Strawson to claim, that 'The F is G' presupposes but does not entail 'The F exists'. Presupposition is a notion which has been utilized more extensively by grammarians than by philosophers (see Presupposition).

The second aspect is Strawson's account of the meaning of the logical constants. He argues that it is a mistake to equate the meaning of the formal logical constant with the meaning of the natural language expressions with which logicians pair them. The case most extensively argued for is the pair ' →' and 'if…then…'.

Strawson's view is that natural language expressions have a meaning because their use is governed by various context-relative and imprecise rules, some relating to entailment, others to reference in a context. The formal logician has devised a system to track various general entailments, but this system gives neither an exhaustive nor totally accurate account of the complexities of natural language (see Formal and informal logic).

4 Truth and meaning

Strawson published a series of articles about truth, most of them collected in *Logico-Linguistic Papers* (1971). The central idea is that Ramsey's redundancy theory is correct (according to which roughly 'S is true' is equivalent to 'S'), but that it can be supplemented by noting that the presence of the truth-predicate enables us to perform various distinctive speech acts. For example, we can use it to concede ('It is true that p, but…'). Initially Strawson was close to, and was taken to be, endorsing a 'performative theory' of truth. Strawson defended these ideas against Austin's version of the correspondence theory of truth. Austin endorsed a formula claiming, roughly, that a statement is true if the state of affairs with which it is demonstratively correlated (to which it refers) is of the type with which the statement is descriptively correlated (see Austin, J.L.; Truth, correspondence theory of; Truth, deflationary theories of).

Strawson offers many criticisms. Among the crucial problems he alleges are the following: (1) the formula can apply to only a limited class of descriptive sentences; it can hardly fit, for example, generalizations; (2) talk of a sentence being correlated with a state of affairs is vague; (3) even if, contrary to fact, it captures what must hold for a sentence to be true, when we say 'it is true that p' we are not *reporting* the fulfilment of that condition.

The prolonged debate about truth between Strawson and Austin was the most important discussion of truth in the period until Dummett and Davidson, in their different ways, significantly altered its direction. Strawson has contributed to both the subsequent debates about antirealism and about the truth-conditional theory of meaning, with its attendant idea of specifying the logical form of natural language sentences. About the former, Strawson

(1976) argues that antirealism is a plain distortion of our thought, for example, about other minds. It is a distortion, and it is needless, answering to no legitimate demands (see Realism and antirealism). Strawson's attitude to Davidson is more extensively presented. In 'Meaning and Truth' (1971) Strawson argues that the notion of truth is secondary to that of saying, and that saying itself involves the idea of belief expression, and concludes that truth-theoretic accounts of meaning are unsuccessful and a better elucidation of meaning would analyse it in terms of the expression of basic psychological states, along the lines sketched by H.P. Grice (see Communication and intention; Meaning and truth).

Strawson has also repeatedly criticized the views of Quine. In an article written with H.P. Grice, 'In Defence of a Dogma' (1956), it is argued that Quine's criticisms of the analytic/synthetic distinction rest on an illegitimate demand that semantic notions should be reducible to non-semantic ones, and that the agreement observed in applying the distinction indicates that it corresponds to something real. In other articles (for example, Strawson 1985) Strawson has argued that some of the categories which Quine himself applies to language presuppose the application of other semantic notions which Quine rejects, and he has also argued that we cannot engage with language in the way we do and at the same time be sceptical about the application of the notions which Quine rejects, for example, determinacy of meaning (see Analyticity; Radical translation and radical interpretation).

5 Subject and predicate

Strawson has written on a number of occasions about the distinction between subject and predicate. His constant aim has been to explain the linguistic features of the distinction in terms of the ontological differences between the items that different parts of language introduce. Both his discussion of this problem in part 2 of *Individuals* (1959) and in *Subject and Predicate in Logic and Grammar* (1974b) exemplify this. In the latter he begins by listing various suggested differences between subjects and predicates, including Geach's proposal that negation and compounding attach to predicates, and Quine's that subject expressions alone yield places for quantification, but argues that, even if they are not dubious, they cannot be regarded as fundamental, precisely because they are in need of explanation. Strawson suggests that the explanation is that a basic type of judgment, central to human thought, in which it is judged that a spatiotemporal particular possesses a general character, are expressed by subject/predicate sentences, and the role of subject expressions is to indicate the particular and one of the roles of the predicate is to indicate the general characteristic. (Predicates also have an assigning role, of representing that the general characteristic is being assigned to the particular.) Strawson suggests that the initial marks of the subject/predicate distinction can be derived from this fundamental characterization once the contrasting nature of empirical particulars and general characteristics is described. Thus, if C is a feature then lacking C is also a feature, whereas, if X is a particular object there is no such object as the other-than-X. This is why negation goes with predicates, and not with subject expressions (see Predication; Reference).

6 *Individuals*

Strawson's project in *Individuals* is 'descriptive metaphysics', as opposed, on the one side, to 'revisionary metaphysics', and on the other, to ordinary philosophical analysis. It differs from the latter by aiming to lay bare the fundamental and most general features of our conceptual scheme, from the former by aiming only to describe the structure of our thought and not revise it. In *Individuals*, and in more recent writings, Strawson has opposed attempts to revise the fundamentals of our conceptual scheme, and part of the point of the division is to show that fundamental investigations need not be motivated by a revisionary purpose.

Strawson starts with the idea that a hearer can know of which object a speaker is speaking. He talks of the hearer *identifying* the particular, and of the speaker making an identifying reference (see §2 above). It may be that some types of particulars are identifiable only on the basis of prior identification of another type of particular. The latter are then described as more basic in our scheme of thought. His picture is that identification by demonstration is possible for sensibly present particulars, and that other particulars can be identified by their relation to such sensibly present items. But we can have a grasp of this spatiotemporal framework only if we can *re*identify particulars over time. An epistemological conclusion follows; no one can think that all our criteria for reidentification are mistaken or dubious, since this claim undermines the intelligibility of our thought of the framework in terms of which the doubt is expressed. Strawson argues that within this framework bodies are, in the sense explained earlier, the basic particulars. They are observable, enduring, and form a relatively stable framework. They are to be contrasted with what Strawson calls 'private particulars', such as P's pain, which can

be identified only via their possessors; theoretical unobservables; and events, some of which are perceptually observable but which, as a type of thing, do not form a sufficiently stable framework. Finally, the reidentifiable entities necessary for our grasp of the spatiotemporal framework are bodies, and reidentifying events rests on reidentifying the bodies involved in them.

This complex leading argument in *Individuals* has inspired considerable debate, both about the truth of some of the claims, for example, whether events are secondary to bodies, and whether the framework of events is so irregular, and about the status of Strawson's claims, for example, how far the argument rests on contingencies of the human environment and how far is it supposed to be necessary (see Campbell 1994).

In Chapter 2, Strawson considers this last question by attempting to find a place for the concepts of an unperceived and reidentifiable particular, and of oneself, in the thought of an imagined creature whose experiences are restricted to a world of sound. Sounds are not intrinsically spatial, and so considering such a world illuminates the degree to which space is fundamental to our thought. Strawson argues that some ground is needed to distinguish between hearing the same sort of sound on different occasions and hearing the same individual sound. He employs a master-sound-sequence, which is constantly heard and which varies in regular ways, to substitute for spatial location, and thereby grounds a distinction analogous to the one required. It is conceded to be incomplete, and, moreover, it is problematic that there is a ground in this world for the experiencer to think of itself, for, as Strawson puts it, a 'non-solipsistic consciousness'. The purpose of this brilliant chapter is to promote understanding of the character of our own scheme, rather than to make the sound world genuinely intelligible (see Evans 1980).

7 Persons

Strawson begins Chapter 3 of *Individuals* with two questions. Why do we ascribe states of consciousness to anything? Why do we ascribe them to the same thing to which we ascribe physical predicates? Two theories would not accept this characterization of our concepts: according to the no-ownership theory consciousness is not really ascribed to any object at all, and according to Cartesian dualism we ascribe the two characteristics to two separate entities: egos and bodies (see Dualism). However, the no-ownership account is incoherent because it needs to explain how conscious states are associated with bodies, and it can do that only by picking out a range of experiences as being someone's. Against dualism Strawson brings a fundamental principle: it is a necessary condition of ascribing states of consciousness to oneself that one does, or is prepared to, ascribe them to others. To be available for identification, other subjects must have non-mental, that is physical, characteristics. Another subject cannot be picked out as the ego standing in that same relation to that body as I stand to mine, because this makes reference to others secondary to self-reference, contrary to Strawson's fundamental principle. Further, by what right is it assumed there is only one such ego per body? Strawson also stresses in 'Mind, Body and Soul' (1974a) that it is hard to understand the notion of non-spatial particulars; the way that we have of understanding the possibility of numerically distinct but qualitatively identical particulars of a spatial kind, namely that they occupy different *places* in a spatial framework, is not available for egos.

Rejecting these characterizations, Strawson suggests that the concept of a person is 'a primitive concept' (1959: 101), by which he means that it is a primitive practice to recognize oneself and others as objects with both physical and psychological characteristics. From this he draws the epistemological consequence that at least for some psychological properties the ways of telling 'that they apply to others must constitute logically adequate kinds of criteria' (1959: 105). Strawson is suggesting that there cannot be a genuine problem of other minds. Nothing so far says how the material and the psychological relate. In Chapter 3 of *Skepticism and Naturalism* (1985a) Strawson claims that it is more satisfactory to regard psychological and neural events as causally related, rather than as identical.

Strawson's claims have been widely discussed. In particular, his fundamental principle and his epistemological claim about logically adequate criteria have been questioned (see Ayer 1964). Whatever the resolution of these questions, Strawson has undoubtedly articulated some fundamental aspects of our thought about ourselves and others (see Persons).

8 *The Bounds of Sense*

The Bounds of Sense (1966) is an exposition and criticism of Kant's *Critique of Pure Reason* and a defence of certain claims about the necessary structure of our experience, which resemble those advanced by Kant.

Strawson rejects Kant's transcendental idealism. He provides a careful interpretation of it but argues that its incoherence is particularly clear in relation to the self, the location of which oscillates between the phenomenal world and the noumenal world. Strawson is, however, highly sympathetic to many others among Kant's positive and negative claims. In particular, he suggests that from Kant's arguments in the Transcendental Deduction a strong case can be reconstructed for saying that it is unintelligible to suppose that there is a self-conscious subject unless some of the experiences of the subject are of, and are taken to be of, independent objects other than itself. From Kant's arguments in the Analogies support can also be extracted for the claim that the subject's experience must allow the application of concepts of persisting and re-encounterable objects in a spatial framework, and of causal properties and powers.

Strawson defends the first necessity, that unity of experiences in a single subject requires experience of objects, by arguing that there is no point in ascribing a succession of experiences to a single subject unless for some of its experiences a distinction exists between the way, in that experience, it seems to the subject and the way the experienced item actually is. Then the notion of experience, as something distinct from but related to reality, has a point, and with it, the notion of the possessor of the experience, the subject. If, *per impossibile*, we had a subject none of whose experiences permit this distinction to be applied, then we have lost the idea that there is experience at all, and we have lost the idea of a subject. If Strawson's modified Kantian claims are correct, there is no genuine problem corresponding to that which gripped the empiricists, of showing that there is an external world on the basis of the character of private experiences. Indeed, part of the point of Strawson's enquiry is to outlaw that problem.

Strawson's brilliant treatment of Kant has been widely discussed. Two areas of debate may be singled out. One is that the force and soundness of transcendental arguments, as a style of philosophical argument, is disputable (see §9 below). The other is whether Strawson, despite his sympathetic approach, has provided the best account of the significance of Kant's idealism (see Transcendental arguments) (Walker 1978).

9 Epistemology

In *Individuals* and *The Bounds of Sense* Strawson developed a response to different types of scepticism by defending transcendental arguments. These are of two sorts. In *Individuals*, especially Chapter 3, which deals with other minds, he claims that in order to employ psychological concepts at all - which, of course, the sceptics themselves do - one must acknowledge the adequacy of our basic ways of telling that they apply to others. In *The Bounds of Sense* the transcendental claim is that the conceptual applications which the sceptic is prepared to make (roughly about themselves and their experience) require the application of the concepts about the application of which they are sceptical.

Against such arguments it has been objected that we cannot be confident that the intelligibility of the concepts requires what is claimed. There is the permanent fear of an overlooked possibility. It has also been disputed what the force of the final requirement is. Is it merely that the concepts are applied or is it that they are veridically applied (see Stroud 1968)? Finally, what other things, if any, need to be said in response to the sceptic, even if the transcendental claims are accepted?

In *Skepticism and Naturalism*, Strawson, developing themes in Hume and Wittgenstein, argues that it is simply natural for us to believe in bodies, and this psychological fact renders any chance of sceptical arguments generating real doubt impossible, which means that such arguments need not be taken seriously. As Strawson says, ‘Arguments on both sides are idle’ (1985a: 29). Strawson's new viewpoint seems to be sustained by doubts, of the kind mentioned, about the anti-sceptical value of transcendental arguments. The proposal has been much debated, the chief issue being whether the idleness of the sceptical arguments is itself ground for ignoring them (see Scepticism).

10 Philosophy

There are certain general and recurring themes in his philosophical writings (particularly his later writings) which need to be described. Although Strawson does not share Wittgenstein's conception of philosophy, regarding

philosophy as a rational and theoretical (and not primarily therapeutic) activity, he has evident sympathy with the conceptual conservatism implicit in the slogan that philosophy 'leaves everything as it is'. There is no ground in philosophy to criticize our fundamental opinions. An example is Strawson's treatment of the supposed conflict between moral responsibility and determinism in 'Freedom and Resentment' (1962). His basic claim is that our view of ourselves as responsible is an ingredient in a network of emotional responses which cannot be abandoned and which do not rest on any general conviction that might be refuted. Philosophy is, in this way, full of false forced choices. They have their sources in multifarious misconceptions. One misconception is scientism, the idea that science is the arbiter of all empirical truth. Another is a tendency to misinterpret common convictions: for instance, our tendency to refer to abstract objects seems problematic because all objects are regarded as necessarily material or quasi-material. Another is the failure to appreciate that there can be autonomous conceptual levels, evidenced in philosophical demands that all truths be reducible to some favoured base, say, the language of science, or a neutral sense-datum language. Strawson's idea here is that either the favoured language is itself a development of, and hence secondary to, the prior language (as in the case of science), or is mythical (sense-datum language). A central task of philosophy is to describe, and in the best way we can, explain the irrevocable fundamentals of human thought. The explanation consists in linking elements in the structure of concepts and experience, for example by displaying how our thought of ourselves links with our conception of the nature of experience. This structure of philosophical convictions has been enormously influential, for example, on and through the work of Gareth Evans, David Wiggins and John McDowell.

PAUL F. SNOWDON

List of works

Strawson, P.F. (1950) 'On Referring', *Mind* 59: 320-44; repr. in *Logico-Linguistic Papers*, London: Methuen, 1971.(Strawson's first, and very famous, discussion of definite descriptions and Russell's treatment of them.)

Strawson, P.F. (1952) *Introduction to Logical Theory*, London: Methuen.(Strawson's account of the fundamental notions of formal logic, and of the relation between formal logic and natural language. Chapter 9 is Strawson's influential attempt to 'dissolve' the problem of induction.)

Strawson, P.F. and Grice, H.P. (1956) 'In Defence of a Dogma', *Philosophical Review* 65: 141-58.(A jointly written reply to Quine's criticisms of the analytic-synthetic distinction.)

Strawson, P.F. (1959) *Individuals: An Essay in Descriptive Metaphysics*, London: Methuen.(Strawson's highly original essay in descriptive metaphysics. Part 1 tries to determine the role of bodies and of persons in our thought, and Part 2 links the subject-prediacte distinction to these roles.)

Strawson, P.F. (1966) *The Bounds of Sense*, London: Methuen.(Strawson's magisterial study of Kant's first Critique.)

Strawson, P.F. (1971) *Logico-Linguistic Papers*, London: Methuen.(Contains, among others, 'Identifying Reference and Truth Values' (1964) and 'Meaning and Truth' (1969).)

Strawson, P.F. (1974a) *Freedom and Resentment and Other Essays*, London: Methuen. (Contains 'Mind, Body and Soul' (1966) and 'Freedom and Resentment' (1962).)

Strawson, P.F. (1974b) *Subject and Predicate in Logic and Grammar*, London: Methuen.(A further discussion of the subject-predicate distinction, and of other aspects of natural language.)

Strawson, P.F. (1976) 'Scruton and Wright on Anti-Realism etc.', in *Proceedings of the Aristotelian Society* 77: 15-21.(A brief presentation of Strawson's views on antirealism.)

Strawson, P.F. (1979) 'Perception and Its Objects', *Perception and Identity*, ed. J. MacDonald, London: Macmillan.(A characteristic treatment of philosophical problems to do with perception.)

Strawson, P.F. (1985a) *Skepticism and Naturalism: Some Varieties*, London: Methuen.(Strawson's widely discussed study and rejection of philosophical revisions of ordinary thought.)

Strawson, P.F. (1985b) *Analyse et Metaphysique*, Paris: Vrin.(An account, in French, of Strawson's approach to philosophy.)

Strawson, P.F. (1992) *Analysis and Metaphysics*, Oxford: Oxford University Press.(Strawson's description of philosophy, overlapping with (1985b), but containing further topics.)

Structuralism

The term 'structuralism' can be applied to any analysis that emphasizes structures and relations, but it usually designates a twentieth-century European (especially French) school of thought that applies the methods of structural linguistics to the study of social and cultural phenomena. Starting from the insight that social and cultural phenomena are not physical objects and events but objects and events with meaning, and that their signification must therefore be a focus of analysis, structuralists reject causal analysis and any attempt to explain social and cultural phenomena one-by-one. Rather, they focus on the internal structure of cultural objects and, more importantly, the underlying structures that make them possible. To investigate neckties, for instance, structuralism would attempt to reconstruct (1) the internal structure of neckties (the oppositions - wide/narrow, loud/subdued - that enable different sorts of neckties to bear different meanings for members of a culture) and (2) the underlying 'vestimentary' structures or system of a given culture (how do neckties relate to other items of clothing and the wearing of neckties to other socially-coded actions).

Ferdinand de Saussure, the founder of structural linguistics, insists that to study language, analysts must describe a linguistic system, which consists of structures, not substance. The physical sound of a word or sign is irrelevant to its linguistic function: what counts are the relations, the contrasts, that differentiate signs. Thus in Morse code a beginner's dot may be longer than an expert's dash: the structural relation, the distinction, between dot and dash is what matters.

For structuralism, the crucial point is that the object of analysis is not the corpus of utterances linguists might collect, that which Saussure identifies as parole *(speech), but the underlying system (*la langue*), a set of formal elements defined in relation to each other and which can be variously combined to form sentences. Arguing that the analysis of systems of relation is the appropriate way to study human phenomena, that our world consists not of things but of relations, structuralists often claim to provide a new paradigm for the human sciences. In France, structuralism displaced existentialism in the 1960s as a public philosophical movement. Philosophically, proponents of structuralism have been concerned to distinguish it from phenomenology.*

1 Development and domain

Structural linguistics was developed by the Swiss linguist Ferdinand de Saussure in lectures published as the *Cours de linguistique générale* (1916), but the term 'structuralism' was coined by the Russian linguist and literary theorist Roman Jakobson in 1929. Jakobson was a member of the Prague Linguistic Circle which, between 1926 and 1938, drew upon Saussurian linguistics, Russian Formalist literary criticism, Husserl's phenomenology and Gestalt psychology to develop Prague Structuralism. Structuralism was opposed to atomism and was presented as a general method for the humanities and social sciences, although most of the circle's work focused on language, literature and art. A literary work is a structural whole; to study it is to analyse its internal relations (it is a hierarchically ordered system of structures of different kinds) and its place in the systems of a language and a culture, especially the system of literary genres and conventions.

Jakobson himself provided a link between Prague Structuralism and the structuralism which developed in post-Second World War France, first in anthropology (Claude Lévi-Strauss), then in literary and cultural studies (Jakobson, Roland Barthes, Algirdas Greimas, Gérard Genette), psychoanalysis (Jacques Lacan), intellectual history (Michel Foucault) and political theory (Louis Althusser). Although these thinkers never formed a school as such, it was under the heading of 'structuralism' that their work was exported and read in the UK, the USA and elsewhere in the late 1960s and 1970s, where it was influential first in anthropology and literary studies, and later in historical and cultural analysis.

In anthropology, structuralism insists on the reconstruction of underlying systems (of kinship, of totemic and mythic thought) through which a culture orders the world. Within the field of the history of thought it seeks to identify the system of possibilities or formation rules that permit the emergence, in a particular era, of certain disciplines and theoretical objects. In literary studies it promotes a poetics interested in the conventions that make literary works possible, and it seeks not to produce new interpretations of works but to understand how they can have the meanings and effects that they do. In cultural studies generally it encourages attempts to make explicit the rules and signifying procedures that govern fashion or other cultural practices.

According to structuralist theory, the identity of structuralism should come from contrasts within the system of modern thought, from the differences shared by a range of thinkers, rather than from a historical filiation. In fact, the term 'structuralism' is generally used to designate work that marks its debts to structural linguistics and deploys a Saussurian vocabulary, including *sign*, *signifier* and *signified*, *syntagmatic* and *paradigmatic*. There are many writings, from Aristotle to Chomsky, that share the structuralist propensity to analyse objects as the products of a combination of structural elements within a system, but if they do not display a Saussurian ancestry, they are often not deemed structuralist, whatever their affinities with the writings so designated.

Once structuralism came to be defined as a movement or theoretical stance based on a set of principles, some theorists began to distance themselves from it. Readers who could see that works by some 'structuralists' did not fit certain accounts of structuralism began to regard some of these thinkers (particularly Barthes, Lacan, and Foucault) as post-structuralists, going beyond a structuralism defined as a project aiming at mastery of objective structures (see Post-structuralism). In fact, many of the views associated with post-structuralism - such as the difficulty for any metalanguage to escape entanglement in the phenomena it purports to describe, the possibility for texts to create meaning by violating the conventions that structural analysis seeks to delineate, or the inappropriateness of positing a complete system because systems are always changing - are manifest even in the early work of such thinkers as Barthes, Foucault and Lacan who were at the time regarded as structuralists. Post-structuralism involves not so much the demonstration of the inadequacies or errors of structuralism as a turning away from the project of working out what makes cultural phenomena possible and intelligible, and a return to interpreting and narrating (sometimes called 'historicizing').

It is difficult to distinguish, in a principled way, structuralism from semiotics, the science of signs, which traces its lineage to Saussure and Charles Sanders Peirce. However semiotics is an international movement that has sought to adopt a scientific model and to cultivate links with, for example, zoology, while mostly eschewing the philosophical speculation and cultural critique that has marked structuralism in its French and related versions (see Semiotics).

2 Shared principles

Structuralism takes many different forms, but there are some general principles that could be identified as structuralist. Most of these are best stated differentially, as contrasts. Structuralism has defined itself against historicism, atomism, mechanism, behaviourism, psychologism, and humanism.

Structuralism is not hermeneutics (see Hermeneutics). Structural analysis seeks to understand the conditions of meaning, and in that sense it takes the cultural meaning of objects and events as a point of departure, as what requires explanation. Hermeneutics characteristically seeks to discover the meanings of a text or cultural phenomenon. Linguistic analysis does not try to tell us what sentences mean but to explain how these sequences are constructed and how they can have the meaning they do for speakers of a language. The linguistic model enjoins a concentration on poetics rather than interpretation (Culler 1975).

Structuralism is not phenomenology (see Phenomenological movement). Although the intuitions of subjects about the meaning or at least the well-formedness or deviance of cultural phenomena are often its point of departure, structuralism seeks explanation at the level not of structures of consciousness but of unconscious infrastructures, systems of relation that operate through subjects and work to constitute subjects but are not necessarily accessible to them. In *Le Visible et l'invisible* (1964), Maurice Merleau-Ponty imagined the possibility of linking a phenomenological critique of the distinction between subject and object (both subject and object are a posteriori constructs, notions derived from a unitary experience rather than experiential givens) to a structuralist account of the differential nature of meaning. Most theorists, however, have insisted on the fundamental difference in focus and approach between phenomenology and structuralism (Ricoeur 1969).

Cultural phenomena have a relational identity. They are defined by their differences from one another, not by any essential features. This basic principle of Saussurian linguistics has wide applicability.

The object of analysis is not the phenomena themselves but the underlying system which makes them possible or intelligible. Analysts cannot examine all the texts, artefacts or acts related to a given system, for the system, like a language, may have the capacity to produce an infinite set of objects or events. The goal is to identify the set of

contrastive elements which combine, according to rules to be discovered, to produce the cultural forms.

Structure, which is not form alone but the formal organization of content, plays a determining role in human affairs. One writer speaks of 'superstructuralism' to indicate that, in contrast with Marxism which treats language and culture as a superstructure determined by a material base, structuralism and post-structuralism share the conviction that the structures of language and meaning generally are not direct reflections of economic relations but themselves determine the parameters within which human beings live and act (Harland 1987).

The priority of synchronic over diachronic analysis. Saussure distinguishes the study of language as a system (synchronic analysis) from the study of changes in languages over time (diachronic) and argues that describing systems is a condition of understanding changes from one state or system to another. Generally, structuralism has maintained that culture should be studied as a series of synchronic systems, that much 'historical' analysis should be seen as synchronic analysis of moments in the past, and that the analysis of change requires prior understanding of the systems that change.

Structuralism does not narrate. In place of explanation which proceeds narratively, by linking a phenomenon to origins and ends, structural analysis explores conditions of possibility. The critique of structuralism known as post-structuralism often entails, in effect, a return to narrative as a mode of knowledge, but with no confidence in its authority, perhaps because the principled structuralist rejection of narrative explanation has been ignored rather than refuted.

For structuralism, the subject or self is a construct that needs to be explained, not a principle of explanation. It is not that the subject 'man' and human beings do not exist but that what counts as man or what counts as the subject depends upon a cultural system that requires analysis.

Some structuralists (for example, Lévi-Strauss and Lacan) claim to analyse the 'laws of thought' but most are agnostic on the question of whether the categories and rules of one system might be universals. Unlike transformational-generative grammar, which posits a rich universal grammar (a human language faculty that strongly constrains the properties of possible human languages), structural linguistics assumes that one language (linguistic system) may differ radically from the next. Nevertheless, most structural analyses treat meaning as the product of hierarchically-ordered sets of binary oppositions and thus, in effect, posit some universal principles of signification (see Chomsky, N.).

Structuralism in linguistics

The term structural linguistics can be used to refer to two movements which developed independently of each other. The first is European and can be characterized as post-Saussurean, since Saussure is generally regarded as its inspiration. The central claim of this movement is that terms of a language of all kinds (sounds, words, meanings) present themselves in Saussure's phrase 'as a system', and can only be identified by describing their relations to other terms of the same language; one cannot first identify the terms of a language and then ask which system they belong to. Moreover, because a language is a system of signs, one cannot identify expression-elements (sounds, words) independently of the content-elements (meanings), so that a study of language cannot be divorced from one of meaning. The second movement is an American one, which developed from the work of Leonard Bloomfield and dominated American linguistics in the 1940s and 1950s. It attached great importance to methodological rigour and, influenced by behaviourist psychology, was hostile to mentalism (any theory which posits an independent category of mental events and processes). As a result, unlike the first movement, it excluded the study of meaning from that of grammar, and tried to develop a methodology to describe any corpus in terms of the distribution of its expression-elements relative to each other. Whereas the first movement provided a model for structuralist thought in general, and had a significant impact on such thinkers as Barthes, Lacan and Lévi-Strauss, the second made a major contribution to the development of formal models of language, however inadequate they may seem now in the light of Chomsky's criticisms.

1 The concept of structural linguistics

Though a wide range of linguistic studies raise issues which are in some sense structural, we shall focus on two uses of the term *structural linguistics* which refer to separate movements, each of which advanced strong hypotheses about the nature of language and the methodology of linguistics. However, though each of the movements attaches great importance to structural analysis, their reasons for doing so differ profoundly; hence, the need to distinguish them.

The origin of the first movement is to be found in the work of Ferdinand de Saussure, the fundamental contention of which is that, since linguistic items of all kinds (sounds, words, meanings) present themselves as a system, they can only be identified in terms of the relations in which they stand to other elements within the system (Lyons 1973: 6). An acceptance of this thesis, together with one, sometimes qualified, of the following three Saussurean theses, defines post-Saussurean structuralism: it is necessary to distinguish *la langue* from *la parole*, and a synchronic study from a diachronic one; the fundamental linguistic study is a synchronic one of *la langue*; and, finally, a study of expression-elements (sounds and words) cannot be divorced from one of meanings. Of course, within this framework much is underdetermined, leaving scope for different emphases and developments, two of which are considered in §§2 and 3 below.

The origins of the second movement are to be found in the work of the American linguist Leonard Bloomfield, and, in particular, in his book *Language* (1933). Strongly influenced by behaviourist psychology (see Behaviourism, methodological and scientific), Bloomfield proposed an analysis of a speech act in terms of the notions of a *stimulus* and a *response*. In response to a feeling of hunger (a stimulus) one thing I might do is reach for an apple; but if I have mastered a language, another thing that I can do is to utter 'Pass me the apple', which is itself not only a response to my hunger but also a stimulus designed to get you to respond by passing the apple. So language increases the range of responses enormously by bridging the gap between different nervous systems. A problem with this analysis, as Bloomfield concedes, is that in most cases we seem unable to identify independently either the stimulus or the response. Since he defines the meaning of an utterance as a function of the situation in which it is uttered and the response called forth, it is hardly surprising that he concludes that the study of meaning largely evades our grasp. What can be studied nevertheless are the utterances themselves but, to avoid a lapse into a discredited mentalism, or an appeal to a theory which is not available to us, sound methodology requires that the study of language does not appeal to meaning. The study of language becomes, therefore, a study of a set of utterances, or of a corpus - indeed, Bloomfield once defined a language as the set of utterances uttered by its speakers. Such a study concentrates on the formal relations between constituents of utterances. It argues that for each constituent there is a limited range of environments in which it can occur; for instance, 'cat' can occur in the environment 'The jumped', but not in 'John Jill'. So if an item's distribution is defined as the ranges of

environments in which it can occur nondeviantly, there seem to be promising ways of defining its type in terms of its distribution, and of making generalizations about the relations between types. More and more sophisticated approaches to the analysis of a corpus in terms of the distributional relations holding between its constituents were developed in America in the 1940s and 1950s, culminating in the work of Z.S. Harris which will be discussed in §4. So three main features of post-Bloomfieldian structuralism are: it was corpus based; an appeal to meaning was rigorously excluded from the methodology adopted; and the object of analysis was the identification of the constituents of the utterances in a corpus, and the construction of a compact description of the distributional relations holding between them. Paradoxically, whilst it is clear why both movements should be regarded as structuralist, each from the point of view of the other is radically misconceived. Arguably the first movement is the more interesting from a philosophical point of view because of its impact on structuralist thought in general; but the second movement undoubtedly developed much more detailed formal models than the first.

2 The Prague School and functionalism

The central thesis of post-Saussurean structuralism is that the terms of a language present themselves as a system; but precisely what kind of a system do they belong to? A group of linguists whose work was strongly associated with Prague and who became known as the Prague School developed a distinctive answer to this question. For them a language is a dynamic system with many subsystems which interact with each other; one of these concerns the structure of its functional sounds (phonology), another the structure of its words (morphology), another the structure of its sentences (syntax), and so on. Each of these has a stable core, surrounded by a less stable periphery, and is striving for a state of equilibrium which it never quite attains, since a change which stabilizes one part of the system can adversely affect another. The Russian linguist Jakobson, who played a major part in the development of this conception, likened the attempt to restore equilibrium to the moves made in a chess game after the loss of a piece, which may strengthen one part of a defence at the expense of another. The Prague School's dynamic conception of a language as a system of subsystems striving to reach equilibrium led it in turn to adopt a different conception of diachrony from that held by Saussure, for all that it agreed with him that a synchronic perspective is logically prior. Since a language is a dynamic system, the School argued that the force for change in many cases is a state of the system itself, whereas Saussure had argued that change is brought about by factors external to the system which never affect it directly.

An important area in which the School made a major contribution to our understanding of what the system involved was phonology, the study of the functional sound units of a language. It seems clear that all languages utilize a relatively small number of such units (called phonemes), so that 'cat', for instance, contains /c/, /a/ and /t/; but how are they to be characterized, and in what way do they form a system? Saussure was prevented from answering this question in part because he assumed that phonemes were not complex, and that oppositions arise from differences. However, Trubetzkoy and Jakobson questioned both of these assumptions. They argued that phonemes can be analysed in terms of so called distinctive features, which are the ways in which phonemes belonging to the same language are opposed to each other, and that the differences between them arise from these oppositions. For instance, one way in which /m/ differs from /n/ is that the lips are closed when pronouncing it, so that there is a feature (labial) present in one case which is absent in the other. Features of this kind the School called 'distinctive features', claiming that each phoneme can be described in terms of the presence or absence of a small number of such features. Moreover, since what is being described is a set of ways in which the phonemes of a language can be opposed to each other, differences rest on oppositions. This theory was to have a major impact on structuralist thinkers; for example, Lévi-Strauss asked whether there are other kinds of oppositions which give rise to different kinds of structures in domains such as kinship and myth (see Structuralism in social science).

Another novel feature of the Prague School was its attempt to combine a functionalist conception of language with its structuralist conception. The central idea is that a study of a language cannot be divorced from its uses: 'language is not a self-contained whole, hermetically separated from the extra-lingual reality, but in fact its main function is to react to and to refer to this reality' (Vahek 1966: 7). Just as one cannot understand chess fully unless one understands what it is players are trying to achieve, so one cannot understand a language if one does not understand its uses. Moreover, various aspects of use have specific linguistic means of expression; for example, it is natural if one wants someone to do something to use an imperative, if one wants information to use an interrogative, and so forth. Whether functionalism is ultimately consistent with the strong form of the principle of the arbitrariness of the sign embraced by Saussure is questionable. However, by recognizing the diverse uses of

language, the Prague School greatly extended the range of domains open to structural analyses. For instance, if an utterance may have an expressive function as well as a descriptive one, may we not, as a limiting case, have a text which is purely expressive but which can nevertheless be analysed structurally - a poem for instance?

3 The Copenhagen School and glossematics

Arguably, the Prague School's theory of oppositions, which positively characterizes one item in an opposition, is incompatible with the Saussurean theses that in language there are only differences without positive terms, and that language is a form not a substance. The work of the Danish linguist Hjelmslev, which takes these theses as its cornerstone, is in this respect a more faithful development of the Saussurean conception of a system.

The fact that a given domain is structured in different ways by different languages shows, Hjelmslev argues, that a language is a form not a substance, with its own autonomous principles of organization. In the domain of colour, for instance, we find that 'Welsh lacks the English boundary between *blue* and *grey*, and likewise the English boundary between *grey* and *brown*' (Hjelmslev 1943: 53); other examples of this phenomenon are systems of tense and pronouns. But how can an autonomous system be described without characterizing some elements positively, and so appealing to something external to it? This can be done, Hjelmslev argues, by characterizing the elements *only* in terms of the relations they can stand in to other items, so that it matters not at all what the elements are, provided that *they are different from each other*.

The resulting description is a linguistic algebra which Hjelmslev called a *linguistic schema*; whilst the result of interpreting a schema, that is of applying it to a domain, he called a *linguistic usage*. The difference between schema and usage corresponds to a more and a less abstract conception of *la langue*; and for Hjelmslev the primary object of linguistics is the schema. The proper way of studying this is to develop a deductive system and to define its entities relationally. For example, an item of a given kind *A* is said to presuppose an item *B* in a context *C* if *A* cannot occur without *B*, but *B* can occur without *A*; for instance, an indefinite article requires a count-noun in a noun-phrase, but not vice versa. Another relation distinguished by Hjelmslev is that of interdependence, that is, of mutual presupposition, which is a relation holding, for instance, between vowels and consonants, or mood and tense. Finally, there is a relation called 'solidarity' which obtains when *A*, though compatible with *B*, can occur without it, and vice versa; for instance, this relationship holds between *accusative* and *plural* within a case system. By appeal to such relationships one can, Hjelmslev argued, characterize a linguistic-schema in purely formal terms without recourse to phonetic, phenomenological or ontological premises. Moreover, he argued that such an abstract study underlines the theory of meaning as well as that of expression-elements. For just as in phonetics 'cat' can be further analysed into /c/, /a/, /t/, so the content of 'ram' can be analysed as 'he-sheep', that of 'horse' as 'he-horse', and so on; so that in formal terms we can ask what is the set of minimal constituents and operations on them which will enable us to describe the structure of the content of the words of a language. To distinguish his conception of linguistics as the study of form, that is of a science which 'would be an algebra of language, operating with unnamed entities' (1943: 79), Hjelmselv coined the term 'glossematics'. Whether so abstract a study could be the fundamental study of a natural language, and indeed whether Saussure thought it could be, seems doubtful. But Hjelmslev's work is important because his development of the Saussurean claim that language is a form led to a formal conception of linguistics, and encouraged the comparison of the structure of natural languages with other formal structures in a number of fruitful ways.

4 Post-Bloomfieldian linguistics and distributional relations

Post-Bloomfieldian linguistics developed sophisticated methodologies for the analysis of a linguistic corpus, and, as an example, we shall concentrate on one of those developed by Z.S. Harris. This methodology did not have to be used when framing hypotheses, Harris argued, but it is needed to check the validity of claims made; and though there is no uniquely correct methodology, 'what is essential is the restriction to distribution as determining the relevance of the inquiry' (Harris 1951: 6). Since distributional relations are ones of co-occurrence or of mutual substitutability, the restriction is tantamount to the Saussurean one of the study of syntagmatic and paradigmatic relations. So that, though a corpus-based study like Harris' has no use for the conception of *la langue*, it does restrict the field of inquiry in one important respect in an analogous way to that in which Saussure did.

A distributional analysis must proceed at two levels, phonemic and morphologic. At each of these levels it must first identify the relevant units, before going on to describe the distributional relations holding between them. To

analyse *This is my house* on the morphemic level we must identify its morphemic segments. What shows, for instance, that *house* is such a segment is the fact that it is replaceable by many other *prima facie* segments, such as *car*, *hat* and *dog*, all of which can occur in other environments, such as *She has a* , *big* , and so forth. Having identified the morphemic segments in a corpus, then to give as compact a description of the corpus as possible it is necessary to group the segments into morphemic classes, and these in turn into more inclusive classes. For instance, segments occurring in the environments *The* and *s* are classed as *N*; whilst those which occur in *ed*-past are classed as *V*, within which class we could, for instance, distinguish segments occurring before *N* (*V-trans*) from those which do not (*V-intrans*). The need for more inclusive classes is shown by the fact that $N + S$ can occur whenever *N* occurs except when *N* itself is $N + S$ - we have both *the dog* and *the dogs* but not *the dogss* - so it is necessary to distinguish $N + S$ from *N* as an N^2. More inclusive classes can be defined in analogous ways, making very compact descriptions of a sentence's constituents (its 'phrase structure') possible. *The boys run*, for instance, consists of a higher order *N* followed by a *V-intrans*; whilst the higher order *N* (an *NP* in more familiar terminology) consists of a determiner and an N^2 which in turn consists of an $N + S$.

The great achievement of the post-Bloomfieldian linguistics was to propose many detailed analyses of sentences in terms of their phrase structure. This made the development of a theory of syntax possible, which is something that Saussure had notoriously failed to do. It also enabled the formulation of a strong hypothesis about *all* theories of structural linguistics, namely that because of the restriction to distributional relations, the most powerful syntactic description of a sentence available to it is of that sentence's phrase structure. Whether the kind of methodology proposed by Harris is capable of yielding such descriptions is another matter. Because of the refusal to appeal to meaning it is fatally flawed from a Saussurean perspective. And whether or not that is so, it seems that to apply his methodology Harris would often have to assume he knew something which at that stage had still to be established; it is hard to see, for instance, how on his account one could identify any morphemic segment unless one had already identified some others. But though the methodology is flawed, the crucial objection - due to Chomsky - is that the linguistic descriptions proposed are inadequate; a phrase structure analysis cannot distinguish *John is eager to please* from *John is easy to please*, for all that in the first *John* is the agent, but not in the second. So despite its many insights and achievements, structural linguistics has inherent limitations.

Structuralism in literary theory

'Structuralism' is a term embracing a family of theories that between them address all phenomena of the human world - notably language, literature, cookery, kinship relations, dress, human self-perception. In all these domains, structuralists claim, the observable, apparently separate elements are rightly understood only when seen as positions in a structure or system of relations.

The linguist Ferdinand de Saussure is generally recognized as the founder of the structuralist movement. For him semiology - the science of the meaning of natural languages - consists in determining the formal place of any signe *within the inclusive system of signs that is language (*langue*), that is, to see it as a 'difference' among the system of inseparably linked 'differences'. Literary significance is treated in a similar way. But both in linguistic and literary studies the existence of a complete and closed system has been largely anticipated, presupposed rather than confirmed, where no more than fragments of the supposed system could ever really be collected.*

This itself is a point of serious contention: for one thing, the meaning of any fragment of a would-be system seems, on the structuralist view, not to be defined if the full system is not accessible; for another, there is no way to approximate to the inclusive system to which apparent fragments belong. But if that is so, it is asked, then can structuralism - whether applied to literature or to language in general - be a science at all?

1 Historical overview

The earliest structuralist practitioners includeSaussure, the Russian linguist and theoristT.S. Trubetzkoy, and Roman Jakobson. The movement expanded rapidly to encompass a remarkably diverse company, of which the best-known (though not theoretically uniform) contributors include the anthropologist Claude Lévi-Strauss, the psychoanalyst Jacques Lacan, the narratologist Gérard Genette, the early Roland Barthes, the literary critic Michael Riffaterre, the theoretical linguistLouis Hjelmslev, the analyst of narrative and social structureA.J. Greimas, and the folklorist V. Propp. To list such a diverse group is to confirm structuralism's cross-breeding tendencies. This was already apparent in the strong Slavophone branch of the movement, which linked Russian Formalism with structuralism and saw the flowering of Prague linguistics and literary studies in the second and third decades of the twentieth century. Remarkably, Roman Jakobson was prominent in both Slavic movements and appears to have introduced Lévi-Strauss to structuralism.

Once it became clear that the fixed system of *langue* or literature was unlikely to be determined and the seminal idea of an underlying network of internally linked significative *relata* became more and more generously construed, it became commonplace to recognize conceptual homologues of the structuralist orientation: for instance, in the works of Louis Althusser, Michel Foucault, Mikhail Bakhtin, Northrop Frye, Noam Chomsky, Lucien Goldmann, René Wellek, Jean Piaget, Bourbaki, Pierre Bourdieu, and even Ernst Cassirer. In any case, the general eclipse of the movement's core (that is, the eclipse of the model of a science of 'differences' or *relata* functioning within a closed system of *relata*) has ensured the permanent presence of the structuralist theme itself - among the human studies (for instance, various literary, linguistic and cultural studies). For there is no commanding alternative model of description and explanation among these studies that has been able to displace the semiological (significative, symbolic, syntactive, self-referential or interpretable) dimension of the human world, or to account for it in a way that does not to some extent suggest a system of differentiated *relata* construed as a holist model of rationality (a closed system factored by constituent *relata*).

2 General features of structuralism

Structuralism is traced as a distinct movement largely through the genealogy of its originating theories. For example, it is often claimed that Northop Frye's *Anatomy of Criticism* (1957) contributed to English-language literary structuralism. But Frye is explicitly an Aristotelian; his theory of determinate literary genres is largely based on Aristotle's conception of a biological species applied to forms such as tragedy and related genres thatFrye believes fit the same scientific analogy. Frye's 'structuralism' cannot reasonably be traced back toSaussure or Jakobson or to any intermediary figures, and so it is rightly thought not to be structuralist in the original sense of the term, though it bears a remote resemblance to structuralism. A similar argument may be mounted to show that Noam Chomsky is not a structuralist. There is little to be gained from such disputes.

Structuralism was originally motivated by a repugnance for those fields of the human studies that could not reasonably claim the status of a bona fide science - that is, could not address what is distinctive about the human world and at the same time be capable of supporting a methodological rigour comparable to that of the natural sciences. Without ever proving it, the structuralists (notably, Lévi-Strauss) believed that the 'laws of thought' (which supposedly determined the system underlying the phenomena of the human world) were ultimately the same as the laws of physical nature. In fact, they could not provide a sustained account of how the underlying structure could be confirmably abstracted from or imposed a priori on the pertinent phenomena.

The difficulty is deeper than it first appears. Consider that distinctly human phenomena are formed, entrenched and made legible to the apt members of a human society through practices that enable new cohorts both to share those practices and to discern their significance. The aggregated body of such practices is plainly collective, in the sense that no single participating human can master all of them. Oddly, on the one hand the structuralists tend *not* to theorize about the causative conditions under which system-like structures may be deemed to regularize the variable phenomena of cultural life; on the other, there are many theories that admit something like the structuralist thesis but are palpably not structuralist in the relevant sense. Almost any account of societal life - Hegelian, Marxist, Durkheimian, Weberian, Diltheyan, phenomenological, neo-Kantian, hermeneutic, Frankfurt Critical, Wittgensteinian and possibly even Aristotelian - will bear some resemblance to the structuralist emphasis; but that hardly warrants marking them down as structuralists, in all but an unacceptably vacuous sense. It is currently well-nigh impossible to distinguish sharply between structuralist or semiological analyses of literary materials and, for instance, hermeneutic accounts - except for differences in their theoretical lineage.

In this sense, both Barthes (1977) and Bloom (1973) favour the imposition of interpretive codes on canonical texts and canonical readings - codes that claim no canonical validity of their own beyond the power of their sheer plausibility and fresh force; and yet, Barthes, but notBloom, will be recognized as a kind of structuralist despite his (welcome) liberties. In fact, Jakobson and Lévi-Strauss' analysis of Baudelaire's *Les Chats* (1962), which many claim to be the very paradigm of a structuralist analysis of poetry, has been seriously (and reasonably) challenged - not so much for the details of its analysis as for the mistaken picture of structuralist analysis it affords (Riffaterre 1970).

3 Treatment of literature

To speak of a structuralist account of literature - chiefly poetry and narrative prose - is to emphasize, however informally, one or more of the following themes:

(1) the underlying and invariant laws of mental activity, unconscious at the level of linguistic and other cultural phenomena (Lévi-Strauss' central theme (1967));
(2) a dominant binarism ofSaussure's kind (*signifiant*/*signifié*), applied congruently with Jakobson's analysis of metaphor and metonomy (1956);
(3) a formal system of interpretive analytic codes said to constitute the underlying structure of the domain in question (notably, in V. Propp (1928) and A.J. Greimas (1987));
(4) any combination of (1)-(3), strictly or loosely.

Any interpretive critic or theorist meeting conditions (1)-(4), exhibiting a relevant lineage, may reasonably be said to be a structuralist. In this sense, Barthes (here, the 'later' Barthes, author of *S/Z*) andFoucault *are* structuralists, in spite of the fact - though possibly because of it - that they are also poststructuralists, that is, critics of the extreme presumption of the canonical structuralists; they are themselves interpretive critics who attack the sense of closure, apodictic certainty, a priori necessity or the fixities of canonical structuralism.

Barthes and Riffaterre provide an interesting contrast in their development; for both may be said to exhibit the general marks of structuralist lineage: in *The Elements of Semiology* (1964), for instance, Barthes accepts a relatively straightforward Saussurean theory; but, in *S/Z* (1970), in 'From Work to Text' (1977) and in other places, he overthrows strict structuralism in a decidedly florid poststructuralist manner. Riffaterre begins early on as a critic of Jakobson's poetic model, but then adheres quite strictly to the closure and relative isolation of the poetic domain itself (1984). Tacitly, Barthes' model calls Riffaterre's closure into question; and Riffaterre's would deny the coherence ofBarthes' practice. Yet both are structuralist. Without giving a detailed comparison of their critical methods, it needs to be said that the underlying dispute that their opposed practices implicate is the one that

animates Lévi-Strauss' criticism of Jean-Paul Sartre (*Tristes Tropiques* 1955).Lévi-Strauss challenges the putatively superficial history of phenomenal change, favouring instead the 'diachronic' articulation of an underlying 'synchronic' system - and this yields a sense of history deeper than empirical history could ever afford. This is what Lévi-Strauss means by 'anthropology' and its justified displacement of 'history'. The difference between Barthes and Riffaterre is the difference between Lévi-Strauss' andSartre's conceptions - within the space of structuralism.

Riffaterre's isolation of the poetic world from the intrusions of contingent history (developed through his theory of reference) justifies in his eyes the rejection of historical hermeneutics, historical genre studies, associative and impressionistic literary criticism and the like. Riffaterre falls back on the implicit codes of interpretation (sets of formal homologues, he believes) rightly applied to the images of particular poems. Barthes, by contrast, invents new interpretive 'codes' *ad hoc* from the 'infinite' resources of our enveloping culture; here, the undeniable ingenuity of his interpretation (in *S/Z*) threatens (implicitly) to confound Riffaterre's exclusiveness. On the historicist side (ultimately, Foucault's theme), the pretence of constructing a fixed, unconscious system is itself no more than an artefact of a contingent *episteme* (a regime of reason or knowledge) that, in time, will also be superseded. On the 'anthropological' side (which Riffaterre advocates), there can be no methodological rigour in a practice of analysis that is entirely open to the vagaries of phenomenal history.

The formalism of the structuralist approach to literature is possibly more the result of Jakobson's conviction and influence than that of any other early structuralist. Jakobson himself theorized more about poetry than narrative prose. But his single most important contribution to a structuralist analysis of literature, abstracted in a relatively late summary (1960), marks the distinction of poetry but also accords implicitly with Propp's influential study on the narrative structure of the folktale, originally published in 1928. Both Barthes (on narrative) and Riffaterre (on poetry) derive fromJakobson, although Barthes is certainly no formalist and Riffaterre expressly objects toJakobson's theoretical model. The line of narrative analysis (which extends to psychoanalysis and film) may be fruitfully traced to Greimas, Genette,Todorov, Eco and Kristeva. Regarding the analysis of poetry, there is hardly any figure who compares favourably with Riffaterre (1978).

Jakobson's formula (1960) is both famous and arresting: 'The poetic function projects the principle of equivalence from the axis of selection into the axis of combination.' With this, Jakobson means to distinguish between metaphor (vertical equivalences of meaning drawn from a suitable fund: 'selection') and metonomy (horizontal equivalences affected by contiguities of sentential structure: 'combination'); and to indicate the executive direction of poetry *from* the 'associative' equivalences of an imaginative play with images and meanings *to* the 'syntagmatic' equivalences of structural role, stress and the like in sentential contexts. Ironically, Barthes' treatment of *S/Z* may resemble Jakobson's model of poetry more thanRiffaterre's treatment of poetry itself.

Structuralism in social science

Any school of thought in the social sciences that stresses the priority of order over action is 'structural'. In the twentieth century, however, 'structuralism' has been used to denote a European, largely French language, school of thought that applied methods and conceptions of order developed in structural linguistics to a wide variety of cultural and social phenomena. Structuralism aspired to be a scientific approach to language and social phenomena that, in conceiving of them as governed by autonomous law-governed structures, minimized consideration of social-historical context and individual as well as collective action. Structural linguistics was developed in the early part of the twentieth century primarily by the Swiss linguist, Ferdinand de Saussure. After the Second World War, it fostered roughly three phases of structural approaches to social phenomena. Under the lead of above all the French anthropologist Claude Lévi-Strauss, classical structuralism applied structural linguistic conceptions of structure with relatively little transformation to such social phenomena as kinship structures, myths, cooking practices, religion and ideology. At the same time, the French psychoanalyst Jacques Lacan appropriated Saussure's conceptual apparatus to retheorize the Freudian unconscious. In the 1960s, a second phase of structural thought, neo-structuralism, extended structural linguistic notions of order to a fuller spectrum of social phenomena, including knowledge, politics and society as a whole. Many of Saussure's trademark conceptions were abandoned, however, during this phase. Since the 1970s, a third phase of structuralism has advanced general theories of social life that centre on how structures govern action. In so refocusing structural theory, however, the new structuralists have broken with the conception of structure that heretofore reigned in structural thought.

1 Social structure

The idea of social structure articulates the intuition and experience that social existence is ordered and not merely random and chaotic. Roughly four conceptions of social structure dominate in the social disciplines. At one extreme lies voluntarism, which combines the thesis that all there is to social phenomena are individuals' actions (and mental states) with the idea that with every action individuals wilfully recreate whatever order exists in social life. On this view, there are no real social structures. A second position, considerably more popular than voluntarism, is empiricism, the view that social structures are patterns in actions and practices. These patterns are usually not thought of as determinants of human activity. Rather, they are by-products of actions and practices and the mental states responsible for these. A third conception, grammaticism, assimilates structure to grammatical rules conceived of as non-conscious principles governing speech. On this view, social structures are the sets of rules and principles that govern activities in the different domains of social life. These rules do not determine action, but structure its possibilities, and do so by being embedded in actors' practical understandings or cognitive processes. A final conception, determinism, construes structures as abstract systems that determine action and social phenomena without working through practical or cognitive understanding. These systems are highly counterintuitive, for they are composed of elements, relations and principles known to social scientists alone. Structuralism typically works with structures of this fourth kind.

2 Structural linguistics

The notions of structure and order applied by later structuralists to cultural and social phenomena were introduced first in linguistics by Ferdinand de Saussure in his *Cours de linguistique générale* (1916). Above all two Saussurian ideas influenced structural thought after the Second World War. The first was that language is an autonomous structure distinct from the world. Saussure conceived of language as a system of signs and of a sign as a combination of signifier and signified. A signifier is a material entity - a sound, image, pencil mark - with meaning. Its meaning is the signified associated with it. Saussure argued that the signifiers and signifieds that together constitute signs are defined solely through their differences with other signifiers and signifieds, respectively. This thesis draws signifiers, signifieds and thereby signs into closed, discrete systems. Language is an autonomous structure of elements defined internally through differences, which can be studied in isolation from the world to which it refers and the activities in which it is used (see Saussure, F. de).

Saussure's second telling idea was that abstract structures govern spatial-temporal events. The autonomous system of elements that constitutes language (*langue*) is an abstract (or 'synchronic') entity lying outside space and time

that governs spatial-temporal (or 'diachronic') acts of speaking and writing (*parole*). This famous distinction between *langue* and *parole*, between abstract and concrete linguistic entities, lines up with at least two further oppositions, namely, depth/surface and essential/accidental. Concrete speech acts are accidental and variable phenomena in comparison to the underlying, abstract and essential structure of language.

Saussure thus detached language from social-historical context as well as from the understandings and practices of actual speakers and writers. In studying language, consequently, both history and people can be bracketed (except for comparative purposes).

3 Classical structuralism

After the Second World War, structuralism broke out of the domain of language (and poetry as well as folklore) to focus upon cultural and social phenomena more generally. Its initial phase was marked by wholesale application of the Saussurian apparatus to social affairs and by the resulting assimilation of these affairs to language. Among the social sciences, classical structuralism enjoyed greatest impact in social anthropology, undoubtedly because of the brilliance of that theorist who, more than any other, epitomizes structural social investigation: Claude Lévi-Strauss.

Heralding structural linguistics as the long awaited breakthrough that set the human studies for the first time firmly on the road to scientific knowledge, Lévi-Strauss proposed to extend the field's methods and conceptions of order to encompass communication, or symbolic, systems generally. He wielded, moreover, an expansive notion of a communication system, one that embraced not only myths, religion, and ideology, but kinship structures and social organization as well.

Lévi-Strauss took from Saussure the idea that communication systems are closed, discrete systems that can be studied in isolation from both socio-historical context and the consciousness of actors. Each communication system and type thereof, moreover, possesses an underlying synchronic structure that governs spatial-temporal practices and contents even though it is unknown to the actors involved. Lévi-Strauss further retained the idea that differences and relations, especially binary oppositions, play a crucial role in defining structural elements.

Structures, for Lévi-Strauss, are scientifically constructed matrices of possible combinations of relations (between elements). In the case of a particular kinship system, for instance, an anthropologist might construct a matrix along whose horizontal axis lie 'warm' (friendly) and 'cold' (distant) brother-sister and husband-wife relations, and along whose vertical axis lie warm and cold father-son and mother's brother-sister's son relations. The kinship structure involved would then consist in the possible combinations of warm and cold relations that can characterize the kinship system. According to Lévi-Strauss, which combinations of relations are possible is determined by a rule of transformation (a law), which thus specifies the range of combinations of warm and cold kin relations possible in the system. In this way, autonomous and internally defined structures lying outside space and time govern spatial-temporal states of affairs encompassing individuals.

Most provocatively, Lévi-Strauss maintained not only that all communication systems of a given type (for example, kinship systems) share certain structures, but that the different communication systems found both in a given society and across societies generally are governed by homologous structures. The reason for this homology, he hypothesized, was that all communication (symbolic) systems are ultimately grounded in the logical properties of cognitive brain processes.

The grandeur and scope of Lévi-Strauss' vision captivated a generation of anthropologists and other social scientists, especially in France and the UK, and secured for him acclaim as one of the leading twentieth-century theoreticians of social life.

As Lévi-Strauss was extending Saussurian analysis to cultural phenomena, Jacques Lacan was focusing Saussure's signifier-signified model of the sign inward upon the Freudian unconscious. Although Lacan transcended Saussure's conceptions in important ways, and for this reason is labelled a 'post-structuralist' by some commentators, his theories of child development represent one of the most consequent applications of the Saussurian model of the sign to human beings. Like Lévi-Strauss, moreover, Lacan believed that to apply Saussurian conceptions to phenomena other than language is to analyse these phenomena as if they were language. This attitude, it should be noted, also characterizes those 'semiotic' analyses that, in applying Saussure's

conception of the sign to social and cultural phenomena, treat those phenomena as systems of signs, for example, some of Roland Barthes' work (see Barthes, R. §2; Semiotics).

Lacan's account postulated an initial pre-Oedipal, or 'imaginary', phase of development in which the identity of the child is bound up with its mother's body. The subsequent Oedipal, or 'symbolic', phase is inaugurated when the father (the law) divides the child from the mother's body and drives its desire for her underground, thus forming the unconscious. The child's identity now derives from difference (rejection as the mother's lover, absence of the mother's body); and possession of the mother can occur only in the realm of language. So the child's desire for its mother, severed forever from real possession, can only reverberate within the system of language, moving anchorlessly from signifier to signifier. Dreams offer an especially fertile realm of signifiers for the articulation of desire. In this realm, the movement of desire among signifiers, which Freud had referred to as 'dreamwork', is effected by the substitution and association of signifiers. Dreams are series of signifiers, and the unconscious generally a movement of signifiers, whose signifieds are not immediately obvious. Lacan's theory is summed up in his famous epigram, that the unconscious is structured like a language.

Lacan's controversial Saussurian theories of child development and the unconscious have had greater influence in literary studies than in the human sciences. They have also found greater resonance in movements such as academic feminism and post-structuralism that became prominent after structuralism proper. This reflects how Lacan undermines the structural notion of determinate associations between signifiers and signifieds by fracturing desire among a plurality of signifiers to which stable signifieds cannot be attached. It also bespeaks how Lacan, in following Freud and making other people crucial to children's identity and development, opens the door to acknowledging of the crucial impact of society and history upon systems of signifiers and signifieds.

4 Neo-structuralism

During the 1960s, a wide variety of thinkers adopted an array of theses forcefully promoted by classical structuralism: de-emphasis of history, opposition to basing social life in individual subjects, belief in abstract structures and postulation of a governing stratum that underlies the surface appearances of social life. These thinkers were not, however, in a strict sense structuralists. They did not (1) emphasize the role of difference and opposition in the constitution of abstract, underlying structures; (2) employ Saussure's terminology of signifier and signified; or (3) work with a clear distinction between synchrony and diachrony. These changes meant that, although neo-structuralists retained classical structuralism's notion of internally-defined governing structures, they no longer assimilated the social phenomena governed by these structures to language. These changes also facilitated their attempt to extend the scope of governing structures beyond Lévi-Strauss' communications systems to embrace political systems, the organization of knowledge, and societies as wholes. Accordingly, neo-structuralism exploded classical structuralism's confinement primarily to social anthropology and spread structural ways of thinking to political theory, history and sociology.

Perhaps the most prominent branch of neo-structuralism was so-called 'structural Marxism'. Led by the French thinker Louis Althusser, this school theorized society as a set of political, economic, cultural, educational and other structures. The structures comprising a given society were thought to form a total state of interrelatedness, moreover, to which Althusser gave the name 'mode of production'. For the structural Marxists, all social change is a matter of either the recalibration of the different structures constituting a given society (piecemeal change), or the lining up of these structures in a 'structural conjunction' that enables wholesale transformation of the mode of production (revolution). All social causality and change is thus rooted in the realm of interlocking structures. Individuals, as mere occupants of positions established by structures, are powerless to effect change. Significantly, Althusser abandoned Marx's claim that the economy determined all other social sectors, arguing instead that the economic structure determined the remainder of social life only 'in the last instance'. Although this represented a welcome loosening of economic determinism, Althusser's extreme structural determinism made his position unpalatable to most.

A second especially fertile ground for the broadening of structural thinking was the organization of human knowledge. Jean Piaget and Michel Foucault proposed that human knowledge forms systems governed by abstract principles. Piaget elaborated an account of the genetic stages though which children's knowledge of the world progresses, on each level of which a different set of principles structures knowledge. Foucault, meanwhile, espied three large-scale *epistemes* in Western history since the Middle Ages, in each of which different rules governed the

formulation and certification of knowledge of living beings, language and wealth. During each such period, in his view, knowledge of these matters formed systems governed by rules that were unknown to the individual thinkers and researchers who complied with them. But while Foucault retained the structural marginalization of the individual subject, he like Lacan contravened the structural slighting of history. The rules governing knowledge are 'historical a prioris' that change over time. His work thus broke down the distinction between synchrony and diachrony, and in this and other ways marked a shift into post-structuralism.

5 The new structuralists

Classical and neo-structuralism's de-emphasis of history and agency worked against them in the 1970s and 1980s. Social theorists increasingly found it implausible to isolate communication and sign systems, and social phenomena more broadly, from either speakers/writers/actors or the social-historical contexts of speech, script and action. This, together with (1) the post-structural assault on the differences and binary oppositions wielded by classical structuralists, (2) the earlier mentioned (§3) break-up of determinate associations between signifiers, signifieds and referents, (3) the inability of structuralists to theorize satisfactorily the connections between abstract structures and action-practices, and (4) the spreading European reaction against unself-critical scientistic approaches in the social sciences, dampened enthusiasm for both flavours of structural thought.

Remnants of these movements remain however. Cultural studies in the 1980s and 1990s still widely employed Saussure's figure of signifier-signified. The idea of abstract, underlying structures that govern social phenomena similarly persisted in the social sciences. That these structures are composed of relations also persevered as an influential notion.

Revisions of the latter two ideas formed the heart of a third phase of structural thinking. The 'new structuralists' - the French anthropologist Pierre Bourdieu, the English sociologist Anthony Giddens and the English philosopher Roy Bhaskar (see Critical realism) - prolonged structuralism's emphasis on governing structures. In constructing theories of social life in general, moreover, they perpetuated the structural Marxist attempt to theorize all of social life as governed by structures. Their pursuit of this aim, however, granted action unprecedented prominence: structures relate to social phenomena only by way of governing the actions that constitute these phenomena.

This move underlay the profoundest difference between new structuralism and the two prior phases of structural thought. Structures are not autonomous systems outside space and time whose relations to social phenomena and spatial-temporal doings are an unresolved enigma. Structures instead govern action in being the contents of the practical knowledge on the basis of which people act and interact. The new structuralists thus abandoned the hitherto reigning 'deterministic' conception of structure in favour of a 'grammatical' one (see §1). Indeed, on their view, not only does structure govern action, but structure exists and is able to govern action only because action draws on and thus renews structure. Structure is both the medium and result of action. This circular dependency was accompanied by retheorization of how structures 'govern' action. In Giddens, for example, structures accomplish this by opening and closing possibilities of action.

At the same time, the new structuralists reached back to classical structuralism in depicting the structures embedded in practical understanding as centrally composed of relations and differences. Giddens, for instance, theorized structures as sets of interrelated rules (of meaning and normativity) and resources (arising from commands over persons and objects). These sets are linked by relations of interconvertibility, and thereby form 'structural sets'; redolent of Lévi-Strauss' matrices, that govern systems of action and practice. Bourdieu, meanwhile, exhibited greatest continuity with classical structuralism, construing the structures that govern action and practice as systems of oppositions (such as those between up/down, hot/cold and wet/dry). He combated the hypostatization of abstract structure pervasive in the two earlier phases of structuralism, however, by basing the system of oppositions on opposed movements of the human body and on the biological difference between male and female.

Despite their abandonment of the deterministic notion of structure, the new structuralists perpetuated Saussurian thinking in their accounts of grammatical structure. The future of structural thinking presumably rests on the possibility of further novel transformations of traditional structural themes.

Subject, postmodern critique of

The critique of the subject in late twentieth-century continental philosophy is associated primarily with the work of Foucault, Derrida, Lacan and Deleuze. Driven by philosophical, political and therapeutic concerns, these thinkers question the subject's ability to declare itself self-evidently independent of the external conditions of its own possibility, such as the language in which it expresses clear and distinct ideas, the body whose deceptions it fears, and the historical or cultural conditions in which it perceives reason or tyranny. Moreover, they fear that the ethical price of such insistence upon absolute self-possession is the exclusion and oppression of social groups whose supposed irrationality or savagery represent the self's own rejected possibilities for change and discovery. Their work draws upon Marxist, Freudian and Nietzschean insights concerning the dependence of consciousness upon its material conditions, unconscious roots, or constituting 'outside'. However, their use of these influences is guided by a common fidelity to Kant's search for the 'conditions of possibility' underlying subjective experience, as well as his scepticism regarding our capacity to know the self and its motivations as objects 'in themselves'.

1 Intellectual and historical context

The work of Foucault, Derrida, Lacan and Deleuze, the thinkers primarily associated with the critique of the subject in late twentieth-century philosophy, reflects the intellectual and the political milieu of 1950s and 1960s France, but it also challenges important currents of thought regarding the relation of philosophical reason to historical change or progress. The critique of the subject is simultaneously an attack upon the idea of a universal humanist subject whose reason is reflected in the thought of all 'civilized' cultures, and an attack upon traditional philosophical dichotomies such as reason/madness, consciousness/embodiment or civilization/savagery. To a certain extent, therefore, the critique of the subject is an attempt to renegotiate the conceptual relation between history and philosophy, questioning whether the philosophical or scientific subject is necessarily the primary factor in the intelligibility of historical events. It is both an event in the history of ideas and a challenge to the way in which events (including intellectual events) have been conceptualized by philosophical reason. Traditionally, the self-present, freely acting subject has been considered the pivot linking historicist and transcendental accounts of Western political and psychological experience. A philosophical perspective which questions the plausibility of such a subject reopens the question of how philosophers can make sense of their own historical and psychological experience.

Anti-subjectivist approaches to philosophy arose in reaction to Sartrean existentialism and the extreme capacity for freedom, self-creation and historical agency with which Sartre credited the conscious ego (see Sartre, J.-P.). But Hegel was an equally prominent ghost on the intellectual horizon of this time, due to Kojève's influential lectures and translation of the *Phenomenology of Spirit* (see Hegel, G.W.F. §5; Kojève, A.). Where for Kant the self remained ignorant of its own nature and motivations as thing-in-itself, Hegel argued that the self *was* capable of thorough self-knowledge and conscious freedom to the extent that it recognized social and historical structures as mediating the relation between itself as consciousness and as thing-in-itself. Anti-subjectivist thinkers focused on the role played by mediating social structures in the formation of self-consciousness while retaining Kant's suspicion that such self-knowledge could never be complete. Unlike Kant, however, they placed higher ethical and political significance upon the recognition of this *blind spot* in the constitution of human freedom than upon the belief in human autonomy made possible by such scepticism.

Both Hegel and Sartre believed that historical struggles for freedom constituted the objective basis for the increasing rationality and self-knowledge of the subject. Western political culture, liberal or Marxist respectively, represented for these thinkers the highest form of this self-consciousness to date. It is significant, therefore, that the anti-subjectivist reaction against Hegel and Sartre took place amid upheavals in the world-historical role of the French state. Well before the student uprisings and general strike of May 1968, anti-colonial revolutions in Southeast Asia and Africa explicitly challenged the traditional equation of universal human subjectivity with the political consciousness specific to Western 'man'. The Nazi Holocaust and the legacy of Western imperialism had made it increasingly difficult to perceive the subject described by Western philosophy as the unquestionable vanguard of humankind's march toward historically embodied reason and freedom. Indeed, it became clear how much of the West's material progress and cultural self-sufficiency were built upon the oppression and exclusion of ethnic populations elsewhere in the world.

Ironically, considering his personal history of Nazi involvement, one of the single most important influences upon postmodern critiques of the subject was Martin Heidegger's lifelong investigation into the nature of the subject's *subjectivity* - into what makes it a 'subject' and makes it possible for us to speak of 'subjectivity' as such. For Heidegger, the subject's autonomy and capacity for knowledge do not precede its interaction with objects and other humans but arise amid a pre-given world of involvements, projects, moods and historically given meanings. Heidegger insists that human 'being-there' (*Dasein*) can only be understood from *within* those involvements, through an investigation of the *Being* of both subject and object. Language indicates the various ways in which Being occurs in the world of human involvements. Both the etymology and the ordinary usage of 'being' offer archaeological evidence of the ways in which humans have historically understood the relation between their self-conception as subjects and the way in which both subjects and objects come to *be* (see Heidegger, M. §§2-4).

2 Thinkers and themes

Heidegger's effort to illuminate suppressed or latent philosophical alternatives to the structures through which subjects and objects currently appear to one another served as a starting point for Foucault's investigation into the relationship between history and traditional philosophical conceptions of the self-knowing subject (see Foucault, M.). The Foucauldian critique of the subject explores the historical conditions making possible various conceptions of subjectivity, agency and truth. In his most anti-Sartrean work, *L'Archéologie du savoir* (1969) (*The Archaeology of Knowledge*, 1972), Foucault questions whether historical events are best understood as expressions of human agency, especially the sort of agency thought to define the Western political subject. Like Derrida, Foucault also questions the ontological unity of the philosophical and literary author, exploring the way in which the agency and consciousness attributed by readers to a philosophical or literary author depend upon social and academic conventions regarding the relation between types of texts. In doing so, he draws attention to the different ways in which the concept of truth has established criteria for the assignment of agency and consciousness to particular actors, writers and processes at different points in history. Like Derrida and Deleuze, Foucault attempts to develop the broader philosophical implications of Nietzsche's inquiry (known as genealogy; see Genealogy) into the historical or political origins of central metaphysical concepts such as truth or the good. His goal is less to embed these structures and criteria in a more accurate and complete history than to emphasize their contingency and possible malleability.

Foucault is best known, however, for philosophical histories which describe the production of modern individualized self-consciousness through the everyday social impact of institutions such as the school, prison, hospital, social welfare apparatus, and psychiatric and psychoanalytic discourses concerning sexuality. His work considers the human body as a plastic medium which expresses the biological and productive power of a population insofar as it observes and controls itself under the direction of specific social institutions. Foucault locates modern 'subjectivity' at the nexus of these techniques of control and surveillance, which affect bodies in their most everyday existence and may become the sites of resistance to such institutions.

Analysis of the subject of desire and sexuality forms a major point of contact and contestation among Foucault, Lacan and Deleuze, in addition to 'French' feminists such as Irigaray and Kristeva. In questioning the nature of the subject's relation to history, and in examining the conditions which allow us to perceive reason in both subjectivity and historicity, anti-subjectivist thinkers were also forced to reconsider the nature of the psychological experience in which the relation between reason and madness is expressed. The debt which this philosophical conversation owes to psychoanalysis is enormous. At the turn of the century, Freud's clinical discoveries had undermined the concept of a pure rationality or transparent subjectivity and drawn attention to the complexity of distinctions between the normal and the abnormal or the intellectual and the sexual. Yet by the 1950s the psychoanalytic establishment had downplayed the potentially revolutionary implications of Freudian theory in favour of a practical emphasis on therapeutic techniques designed to *adapt* patients to a social reality considered given and unquestionable. Foucault's early work on the distinction between madness and sanity, and his later accounts of the changing concept of 'sexuality', argued for a historical understanding of the conditions of the possibility of the desiring subject. Yet, despite Freud's contribution to philosophical critiques of the transparent and ahistorical subject, Foucault regarded psychoanalysis as one in a long series of institutions for the identification, study and eventual normalization of those who either would not or could not apprehend themselves as subjects.

Rather than investigate the historical conditions of the possibility of subjective experience and sexual desire,

radical psychoanalyst Jacques Lacan remained interested in the structural and logical conditions making such experience possible and recognizable at *any* point in history. In an effort to restore the critical implications of psychoanalytic theory, Lacan stressed the structural and logical conditions underlying the individual personality as subject of language and desire. His major innovation in Freudian theory is to have interpreted psychoanalysis as a linguistic account of self-formation, and thus to have conceptualized sexual identification and desire as the result of inclusion in a speaking community. In contrast to Anglo-American efforts to think of the psychoanalytic subject as a self-contained (and more or less ‘normal’) manipulator of words, the Lacanian school expressed deep suspicion regarding the extent of the ego’s self-control. For Lacan, neurosis *results* from the ego’s refusal to acknowledge its dependence upon a (conflicted) social and linguistic field in order to maintain an imaginary bodily integrity. Lacan’s theory describes an inevitably *split* subject, whose activity is largely unconscious; a subject formed in the child’s struggle to be represented by language as a speaker. The sexual specificity and desire of the resulting subject are irrevocable marks of this split or insufficiency. Because Lacan considers sexual difference to be a transcendental condition of the possibility of psychological experience as such, his work was both influential upon and ultimately reworked by feminist thinkers who shared his scepticism regarding the existence of transparent (and sexually neuter) subjects (see Feminism and psychoanalysis).

Many of the thinkers under consideration here share a general conviction that the terms of dichotomies such as reason/madness, thought/embodiment, freedom/power, or self/other ultimately depend upon one another and are only maintained *as dichotomies* through an inescapable act of exclusion, intellectual or political. This principle has been most explicitly developed in the work of Jacques Derrida. Like Foucault and Lacan, Derrida was greatly influenced by Heidegger, but unlike the other two he engages directly with Heideggerian texts and problems. Derrida is best known for his critique of the philosophical subject as self-present in the language of its thought. Derrida argues that the history of philosophy has regarded thinking as a sort of transparent awareness of present meaning, comparable to the testimony of a spoken confession rather than the (potentially misunderstood or forged) evidence of a written signature. In fact, he contends, thought always bears witness to ambiguities, to metaphoric constructions, and to prior texts and social contexts which render it partially opaque even to thinkers themselves. ‘Deconstruction’, the name given to Derrida’s technique for the analysis of authoritative philosophical texts, disrupts apparent hierarchies and identities within texts and cultural phenomena by demonstrating the dependence of a superior or independent term upon a constituting exterior or Other. Deconstruction attempts to show that political, ethical, and philosophical subjectivity bears traces of production by a prior social or conceptual field - one traditionally considered to be the subject’s textual *product*, subordinate to him or her.

The ’French’ feminist critique of the subject as embodied and sexually differentiated expands upon the critique of universal subjectivity offered by psychoanalysis and deconstruction. Yet, because of its links to an evolving international political movement, it also attempts to explore the positive aspects of certain non-traditional accounts of subjectivity and community, especially those which give a central role to embodiment or the act of writing rather than the self-presence of consciousness. ’French’ feminism is usually identified with the work of Luce Irigaray, Hélène Cixous and Julia Kristeva, despite great differences in their individual philosophical projects and the spread of ‘continental’ feminism well beyond the borders of France. This philosophical genre is unique for its critique of the supposed sexual neutrality (and therefore *de facto masculinity*) of the universal philosophical subject. Continental-style feminist philosophy seeks to undo the apparent simplicity and givenness of the notion of sex, and to investigate the manner in which culture and language shape the sexed individual’s opportunities for pleasure, political agency and philosophical activity. Like critics of colonialism, continental feminists are particularly concerned to undermine the association of subjectivity with particular dichotomies such as masculine/feminine or Western/non-Western.

Finally, the work of Gilles Deleuze combines a Derridean emphasis on difference and differentiation, a Foucauldian conception of power and the social field, and the psychoanalytic notion of desire (thought of as productive, rather than split) to create a resolutely Nietzschean understanding of the subject as a multiplicity of forces. In fact, subjectivity is for Deleuze only *one* aspect or face of multiplicity. He regards neither the traditional, transparent subject nor the split psychoanalytic subject as the healthiest or most liberating vehicles for productive, desiring multiplication. His collaboration with radical psychoanalyst Félix Guattari produced a major theoretical study of the way in which psychoanalysis itself perpetuates a form of subjectivity appropriate to capitalist production. *Anti-Oedipus* hoped to find in schizophrenia’s noted inaccessibility to analysis the resources for a way

of thinking about history, desire and subjectivity which resists capitalist culture itself. Deleuze’s other works on cinema, literature and historical figures such as Nietzsche, Hume, Spinoza and Bergson offer concepts with which the philosopher may actively *think* of him or herself as multiple without falling into despair at his or her failure to live up to the Oedipalized subject, whether supposedly self-present or self-absent.

3 Debates

This field of continental philosophy is characterized by several key debates. Many of the critical positions described above are designed to undo traditional political and conceptual hierarchies which limit the political agency of the oppressed, as well as the political imagination of theorists. The question remains, however, whether critiques of the subject do not undermine the very idea of an ‘agent’ capable of political contestation, thus perpetuating the hierarchies they were meant to subvert. Similarly, do theoretical accounts of ‘constructed’ subjects (those of Lacan and Foucault) attribute so much power to social structures that it no longer seems possible to imagine subjects exercising the power which capitalist and disciplinary institutions have invested in their bodily activity and self-policing? Critiques of the humanist subject and of the subject of scientific certainty have raised the spectre of cultural incommensurability which provokes many of the arguments between French-influenced continental philosophers and descendants of the Frankfurt School such as Jürgen Habermas. Another heated debate concerns the purported ‘valorization’ of schizophrenia, hysteria and madness in the works of Foucault, Deleuze and the ’French’ feminists. In attempting to scrutinize the theoretical and political context in which distinctions are made between the sane and the insane, do they romanticize or inappropriately universalize their conception of mental illness?

Finally, it must be noted that the concept of ‘postmodernism’ itself is controversial (see Postmodernism). The term and its possible relevance or meaningfulness depend upon our ability to conceptualize continuity, progress or clear breaks between historical periods. Jean-François Lyotard uses the term ‘postmodern’ to indicate the historical condition making possible various aspects of *modernity*, including the distrust of totalizing historical narratives which has characterized much of late twentieth-century thought. Both Lyotard and the American literary critic and Marxist Fredric Jameson emphasize the difference between post-structuralism, a philosophical movement which questions the ahistoricism and rigidity of structuralist accounts of subjectivity and culture, and postmodernism, a sociological or historical characterization of the culture of late capitalist societies (primarily in the First World). Jameson is critical of the supposed distinction between ‘modern’ and ‘postmodern’ periods, but does acknowledge that the decentralization of productive forces and communications networks, not to mention the saturation of everyday life with advertising, have fragmented social consciousness in a new and potentially problematic way. Whether one regards the critique of the subject and the advent of late capitalism as the results of transcendental structures or historical events, the difficult concept of the ‘postmodern’ calls attention to the uneasy relation between historical frameworks of analysis and the philosophical frameworks which have traditionally made sense of history by relying upon the agency of a supposedly self-present subject.

Sublime, the

The origin of the term 'the sublime' is found in ancient philosophy, where, for example, Longinus linked it with a lofty and elevated use of literary language. In the eighteenth century, the term came into much broader use, when it was applied not only to literature but also to the experience of nature, whereafter it became one of the most hotly debated subjects in the cultural discourse of that age.

The theories of Addison, Burke and Kant are especially significant. Addison developed and extended the Longinian view of the sublime as a mode of elevated self-transcendence, while Burke extended John Dennis's insight concerning sublimity's connection with terror and a sense of self-preservation. While Addison and Burke encompassed both art and nature in their approaches, Kant confined the experience of the sublime to our encounters with nature. In his theory, the sublime is defined as a pleasure in the way that nature's capacity to overwhelm our powers of perception and imagination is contained by and serves to vivify our powers of rational comprehension. It is a distinctive aesthetic experience.

In the 1980s and 1990s Kant's and (to a much lesser extent) Burke's theories of the sublime became the objects of a massive revival of interest, in the immediate context of a more general discussion of postmodern society. Kant's theory, for example, has been used by J.-F. Lyotard and others to explain the sensibility - orientated towards the enjoyment of complexity, rapid change and a breakdown of categories - that seems to characterize that society.

1 Origins

Boileau's translation of Longinus' treatise *Peri Hupsous* (first published in 1674) was probably the single most important factor in the establishment of the sublime as a critical and aesthetic concept. For Longinus, the sublime consists essentially in a loftiness and excellence of language which, rather than engaging reason, serves to transport the reader to a higher plane. Indeed, to express and even exceed the vastness of nature through lofty thought and literature is the ultimate human vocation. It is to transcend the baseness and ignobility intrinsic to merely finite being. This is why Longinus goes on to suggest that those who achieve the sublime in literature are more than mortal; they lift us towards the Deity.

Before considering the influence of Longinus' 'self-transcendent' notion of the sublime on the theorists of the eighteenth century, we must first look at a second fundamental source of the concept. It is to be found in the literary criticism of John Dennis, and especially in his *The Grounds of Criticism in Poetry* (1704). In this work, we are told that the sublime consists of great thoughts that move the reader to 'Enthusiasm'. For Dennis, loftiness (that is, great thought) is a necessary, but not (as it is for Longinus) sufficient condition of the sublime. We require in addition that the great thought should transport the soul by means of 'passion'. This leads to a crucial step. Dennis first suggests that ideas producing terror are especially suited to the sublime. In this respect, he distinguishes between terror *per se* and 'Enthusiastic Terror' - terror that is experienced from a position of safety and is consequently attended by joy. (The paradigm here, one presumes, would be terrible events encountered as the subject matter in literature.) Second, the reason for our pleasure in the sublime is shifted on to a reflective awareness of our present immunity from the terrible events under consideration. Self-preservation rather than self-transcendence provides the ground of our response, and while this emphasis on self-preservation is only an aspect of Dennis's theory of the sublime, it is one which he originates and which marks the logical opposite of Longinus' notion. Together, however, the themes of self-preservation and self-transcendence constitute the seed from which eighteenth-century theories of the sublime grew. I shall now consider this in the context of possibly the most influential pre-Kantian theorists: Addison and Burke.

2 Nature

Addison's major discussion of the sublime is to be found in his famous *Spectator* articles on the pleasures of the imagination. In article 412, the subject is introduced by a way of threefold distinction between the great, the uncommon and the beautiful. For Addison, the 'Great' consists not in mere bulk, but in the largeness of a whole view - such as the scenes of an open country, mountains or wide expanses of water. We will remember that, for Longinus, the state of sublime self-transcendence is achieved through the creation of and response to 'lofty' thought and literature - literature that expresses and exceeds nature's greatness. Addison, by contrast, argues that a

similar state of self-transcendence can come about when we encounter nature’s greatness *by visual perception alone*. Nature provides us with a kind of image of liberty, which takes us beyond the confines of the immediate. The mediation of literature or lofty thoughts is not a prerequisite for the sublime in this context.

While Addison extends Longinus’ self-transcendent approach to the sublime, Burke develops Dennis’ notion of self-preservation (see Burke, E.). He bases his argument on the idea that pleasure and pain are logically independent of one another; pleasure is not simply the absence or diminution of pain, and vice versa. The reasoning behind this is as follows. Most of the time, we are in a state of ‘indifference’ (or ‘tranquillity’) where neither pleasure nor pain preponderates. Given this, it is clearly possible to move from a state of indifference to a state of pleasure without the mediation of pain, and vice versa. These unmediated states Burke terms ‘positive pleasure’ and ‘positive pain’ respectively. Having established this logical independence, Burke suggests that while the diminution or removal of pain and danger does not yield positive pleasure, it can be characterized as an agreeable state of ‘delight’. Hence, when terrible things excite ideas of pain or - from a position of safety - danger in our minds, the terror we feel is moderated into a state of delight. A similar state can be occasioned in us, indeed, when we behold vast or obscure items, which test or strain our perceptual faculties without pushing us over the threshold of conscious pain.

Interestingly, Burke explains both these routes to the sublime in terms of a common causal structure. Just as labour is necessary to keep the ‘grosser’ parts of the body healthy, so stimulation is required for the ‘finer’ parts upon which the mental powers act. Indeed, it is on the very occasions that we experience moderated terror or pre-conscious pain that the finer parts receive healthy stimulation - thus diminishing the possible danger that inactivity poses to the system. Burke’s causal argument is far from compelling, however, and towards the end of the eighteenth century Kant offered a more convincing account - an explanation orientated towards the cognitive.

3 Kant

Kant’s most thorough treatment of the sublime is found in his *The Critique of Judgment* (1790). It unites the self-transcendent and self-preservatory approaches in the context of a much broader and more complex theory concerning our ultimate human vocation as rational human beings (see Kant, I.). He distinguishes two fundamental varieties or modes of the sublime. First, the ‘mathematical’ mode arises through our perceptual engagements with vast objects. While his exposition of this is notoriously intricate and often obscure, his basic strategy can be described as follows. As rational beings, when we are presented with some perceptually overwhelming object, we strive to comprehend it - to find some measure whereby we can make its overwhelming aspect intelligible. The use of mathematical rules is the most obvious means to this end. (A towering mountain in the distance, for example, does not perhaps seem quite as towering if we can define it as ‘no more than *x* metres in height’.) However, all rules of measure presuppose units of measurement, and these are, in the final analysis, ‘aesthetic estimates’, that is, based on what we can grasp ‘by the eye alone’ in direct perception. It is at this point that Kant’s reasoning becomes particularly difficult. He seems to hold that, when faced with particularly impressive and vast objects, our search for an appropriate measure leads us towards the idea of infinity itself. We cannot, however, comprehend this notion in perceptual and imaginative terms. It defeats all our attempts to form an aesthetic estimate. The vast object therefore serves a mediating function. In our struggle to find a measure for it, the sense of being perceptually or imaginatively overwhelmed by the infinite illuminates the extraordinary scope of our rational powers. For we can, despite our sensible limitations, at least comprehend the infinite *as an idea*. The experience of the mathematical sublime therefore involves a ‘mental movement’ from privation to exhilaration at the superiority of our rational being over all sensible limitations.

The second mode of the sublime - the ‘dynamical’ - involves a similar mental movement, in this case instigated by our experience of mighty or dangerous objects or phenomena (from a position of safety). Again, Kant’s presentation of the argument is often awkward, but in contrast to the account of the mathematical sublime its logical structure is more straightforward. When beholding a mighty object or phenomenon, we know that in relation to our puny natural being the mighty item has absolute physical authority. It could destroy us many times over. However, as rational beings, we know that we are more than simply entities of physical nature. Life, destruction and death are not blind mechanistic forces; they are given meaning in the context of our rational endeavours. Hence while the mighty object indeed makes us fearful, we can, as rational beings, nevertheless evince a kind of moral resistance to it. In comprehending and articulating the danger, we are elevated above it.

Thus the object serves a mediating role. It provokes an awareness of our sensible limitations, which in turn vivifies the extraordinary scope of our rational being.

The importance of Kant's theory is that it coherently articulates the sublime as an aesthetic experience of 'the containment of excess'. In both the mathematical and dynamical modes an overwhelming item in the natural world is contained by our rational comprehension of it. The fact that this involves a direct interplay between our receptive sensible capacities and rational insight (rather than intellectual comprehension alone) is what gives it aesthetic character. By characterizing it in these terms, Kant is also able to link it (albeit problematically) to general criteria of aesthetic judgment involving, fundamentally, disinterestedness and universality.

4 Postmodern revival

The 1980s and 1990s saw the development of a widespread discussion of contemporary society in relation to the term 'postmodernism'. One of the most remarkable aspects of this development was a massive concomitant revival of interest in the concept of the sublime. J.-F. Lyotard, for example, has not only published a closely detailed account of Kant's position (1994) but also more speculative articles applying the theory. These extremely influential works centre on a modified concept of the Kantian sublime that is analysed in terms of two varieties or modes - on the one hand, a nostalgic, backward-looking mode, which yearns for the lost metaphysical absolutes of Romanticism, and, on the other, a forward-looking mode ('novatio') associated fundamentally with avant-garde art.

In this latter variety the difficulty or *outré* character of the particular work serves to represent the infinite developmental possibilities of artistic creativity. This suggestion of infinite potential is congruent with the ever-accelerating surge of technological transformation - a surge which seems especially manifest in the societal changes brought about by new information technologies. This congruence is taken by Lyotard to indicate an important continuity between avant-garde modern culture and new postmodern sensibility.

Lyotard's application of Kant is at best oracular, and at worst obscure. He seems to focus in particular on the idea that the sublime hinges on a 'mental movement' from a negative to a positive state. But what are the criteria for the ascription of such states? On this point, Lyotard takes us no further than Kant himself. An alternative approach is the one proposed by the author of this entry - again, in a detailed study of Kant and in a number of papers applying a Kantian-type theory. The basic strategy is to eliminate all talk of 'mental movement' and to recentre the theory on logical presuppositions. No matter how overwhelming or excessive an object may be in relation to our powers of perception or imagination, it is, *qua* phenomenal item, of *finite* extent and power. This means that it can be comprehended or contained in rational terms. The sublime object is one whose presence makes this intellectual insight emotionally vivid.

The sublime, then, has become fashionable once again. Raw nature was once the major source of this experience, but now the accelerating complexity and instability of society itself is also acknowledged as a basis of the spectacle. This broadening scope is further reflected in a burgeoning quantity of writing on the relation between sublimity, psychoanalysis, politics and literature. Slavoj Žižek (1988), for example, has considered the sublime in almost all these contexts (and more besides), and reads the experience on the basis of Lacanian psychoanalysis. Thomas Weiskel (1976) has attempted to reconstruct the Kantian approach in relation to the reading and content of texts, on the basis of both Freudian theory and structural linguistics (see Structuralism in linguistics). There is much in philosophical terms that is obscure and/or problematic about all these psychoanalytic strategies. However, it is significant that they draw on Kant's theory to greater or lesser degrees. His approach - suitably modified - seems to offer the best philosophical tool for understanding the basic experiential structure of sublimity that underlies its many historical and cultural changes of emphasis and context.

Substance

For Aristotle, 'substances' are the things which exist in their own right, both the logically ultimate subjects of predication and the ultimate objects of scientific inquiry. They are the unified material objects, as well as the natural stuffs, identifiable in sense-experience, each taken to be a member of a natural species with its 'form' and functional essence. Entities in other categories - qualities, actions, relations and so forth - are treated as dependent on, if not just abstracted aspects of, these independent realities.

With the rise of mechanistic physics in the seventeenth century, the Aristotelian multiplicity of substances was reduced to universal matter mechanically differentiated. This move sharpened the issue of the relation of mind to the physical world. The consequent variety of ways in which the notion of substance was manipulated by materialists, dualists, immaterialists and anti-dogmatists encouraged later scepticism about the distinction between independent realities and human abstractions, and so idealism.

Twentieth-century conceptualism, like some earlier versions of idealism, rejects the distinction altogether, commonly ascribing the logical priority of material things in natural language to the utility of a folk physics, as if they were the theoretical entities of everyday life. As such, their identity and existence are determined only through applications of a theory outdated by modern science. Yet this 'top-down', holistic philosophy of language is belied by the detailed insights of traditional logic, which point clearly to a 'bottom-up' account of classification and identity, that is an account which recognizes the possibility of perceptually picking out material objects prior to knowledge of their kind or nature, and of subsequently classifying them. The idea that material things are theoretical entities, and that their individuation is accordingly kind-dependent, is a hangover from an atomistic approach to perception which calls on theory to tie sensory information together. A more accurate understanding of sensation as the already integrated presentation of bodies in spatial relations to one another and to the perceiver is consonant with the possibility denied by the idealist- namely, that, with respect to its primitive referents, language and thought are shaped around reality itself, the independent objects given in active sense-experience. That the coherence or discrete unity of material objects has a physical explanation does not mean that physics explains it away.

1 The canonical concept of substance

The definitive concept of substance is Aristotle's, but it arose within an existing debate about what fundamentally 'is' in the world - meaning thereby not only what ultimately *exists*, but also what ultimately *is* such or such, as the subject of predication. The term employed, ουσια (being), was later translated in Aristotle's use of it as *substantia*, substance. Another Aristotelian term applicable to substance, ηποκειμενον, was more usually translated *substratum*, substrate.

Aristotle (see *Metaphysics* I) identifies two extremes. The first, typified by atomism, takes matter to be 'that of which all things that are consist, and from which they come, and into which they are finally resolved'. For atomism, all change occurs through the motion and rearrangement of immutable material atoms (see Atomism, ancient). Plato (see *Republic* V-VII), on the other hand, held the sensible world, because in perpetual flux, to be less real than the eternal universal characteristics or Forms fleetingly manifested in that world. It is the Forms which, as the subject-matter of enduring knowledge, are in the strong sense. Aristotle's middle way (see *Metaphysics* VI) takes unitary 'bodies', both living things and homogeneous stuffs, to be the fundamental objects of knowledge and subjects of predication. Such substances comprise two elements, particularizing matter and universal form. An individual horse is the specific form of a horse embodied in *this* matter. Forms are the objects of universal science - teleological principles of activity and change within what is material and individual.

The Aristotelian theory has two aspects, as it figures in logic on the one hand, and in the theory of scientific knowledge and explanation on the other. In the former role, substance is the first of the 'categories' or 'things said' (see *Categories*). Substances, falling under such predicates as 'horse' or 'wood', *are* in the primary and most fundamental sense. Other 'things said', sometimes called 'accidents', are somewhat arbitrarily listed under nine or ten heads. Such entities as a horse's shape, colour, location or neigh *are* in a derivative sense. They can be subjects of predication, but are themselves 'said of' and exist 'in' something else (in this case, the horse), whereas substances are neither 'said of' nor exist 'in' anything else. The brownness or neigh of a horse exists just in so far

as the horse is brown or neighing, but the primitive noun-predicate ’horse’ simply names the given individual, the horse itself. The horse is thus a logically independent entity, whereas its neighing or brownness is dependent on a subject or substrate. Aristotle called the individual horse the ’primary substance’, which cannot be ’said of’ anything, while the specific ’secondary substance’ *horse* can be ’said of’ (but does not exist ’in’) the individual, and the generic secondary substance *animal* can be ’said of’ both the individual and the species.

Only substances can be the subjects of contraries, that is endure through change, change explicable in terms of their natures or essences. Aristotle’s schema for scientific definition by *genus* and *difference*, later called the Doctrine of Predicables, applies primarily to substances. Non-substantial entities have definable essences in a sense, but Aristotle held, with reason, that only substances fall into natural species with genuine essences. *Properties* are attributes necessarily connected to essence, while *accidents* in the strict sense are those attributes of a substance which neither figure in, nor flow from, its definition. The Doctrine of Categories and the Doctrine of Predicables both encourage a question to which Scholastic Aristotelians gave a variety of answers: what is it for accidents to exist in a substance? The variety reflected the extent to which different philosophers were prepared to treat accidents as ’real’ (that is, really distinct, if naturally dependent) entities, as opposed to taking the view, which Epicurus had held, that they are merely conceptually distinct aspects of independent bodies. William of Ockham and Francisco Suarez wrote famous contributions to this debate (see Aristotle §§12-14; Epicureanism §§2-3; Plato §§2, 3, 8).

2 Early-modern heretical concepts of substance

Modern European philosophy began with a proliferation of variant conceptions of substance in an extended attempt to replace the dominant Aristotelian metaphysics and science with a new authoritative system. Later scepticism about the notion of substance arose with the rejection of this dogmatic enterprise. The very multiplicity of conceptions of substance may suggest that substance-based metaphysics was arbitrary and confused. Yet the various directions taken all fall within an intelligible framework of argument. The crucially productive move was the expulsion of teleological explanations from science through a reversion to something like the ancient atomists’ conception of matter as a substance possessing mechanical properties sufficient to explain all physical phenomena (see Teleology). Materialists such as Thomas Hobbes (1651) concluded that matter or body, determinately modified, is all there is (see Hobbes, T. §3). The variety of sensible qualities by which we distinguish things is a mere ’diversity of seeming’ consequent on differences in structure and motion. The activity of substances is simply the motion of bodies in accordance with necessary laws. Sensation and thought are themselves species of motion. More popular than materialism, however, in that religious age, was René Descartes’ dualism (see Descartes 1641), which postulated incorporeal thinking substance in addition to extended substance (see Descartes §8). A respectable philosophical motive for dualism was that it by-passed the insoluble problem of explaining consciousness, including ’seeming’ itself, in mechanical terms.

This new physics might seem far from the theory of predication, but mechanists saw themselves as explaining the logical relation between substance and accidents: accidents are simply the various and changing sizes, shapes and motions of bodies, limits or determinations of extension rather than Suárez’s distinct real entities mysteriously inherent in a subject. Descartes (1644) took it that, analogously, particular modes of thought are determinations of thought in general, and that the formal idea of a *subject* of extension or thought refers to nothing over and above these attributes. The connection with predication also figured in the system of Spinoza (1677), whose monism constitutes not only a holistic, deterministic philosophy of nature, but also a logical model according to which the ultimate subject of predication is the universe as a whole, of which individuals are modes or aspects (see Spinoza, B. de §§2-3). Leibniz (1686 and 1714), too, in arguing for his anti-materialist monadism, associated two principles: the claim that our awareness of ourselves thinking gives us our only intelligible paradigm of variety within a unitary, active substance, and the logical principle that in every true proposition the predicate is conceptually contained in the subject (see Leibniz, G.W. §§4-5). Partly by means of the latter principle he attempted to explain the identity and diversity of immaterial substances in a non-spatial, non-material world, and his failure supplies an invaluable philosophical lesson. There is, as Aristotle supposed, a demonstrable tie between concrete substantial existence and existence in space.

Logical theory and philosophy of science were differently linked by John Locke (1689), who rejected all claims to know essences and so to understand the substance - accident relation. Substances, including matter and mind, are

known to us only through a plurality of disparate observable qualities and powers, which we take to flow from some common cause. Hence we define the primitive noun-predicates which are the names of substances in terms which include a place-marker for that unknown essence: ‘When we speak of any sort of substance, we say it is a *thing* having such or such qualities, as body is a *thing* that is extended, figured, and capable of motion’ (1689, II. xxiii, 3). ‘Substance’ is just a name for the unknown. Modes, on the other hand, such as a *triangle*, *democracy* or a *triumph* are not mind-independent unknowns, but constructs reflecting human interests and containing nothing more than the features by which they are defined (see Locke, J. §§4-5). Locke was not denigrating the notion of substance, but attacking the pretensions of dogmatic theories. Scepticism was taken further by David Hume(1739-40), however, for whom the philosophical conception of substance was deconstructed as a product of deranged imagination (see Hume, D. §2). After Hume, Immanuel Kant attempted to reinstate the notion on a new basis, advancing the ‘transcendental’ argument that, for objective experience to be possible, it must be experience of a substance (that is, matter) undergoing change in accordance with law. The very ineluctability of the category, however, he took as proof that it does not correspond to anything in independent reality, but is generated by the interplay of sense and intellect, the forms of judgment and the forms of sensibility (see Kant, I. §§5, 6).

3 A new role for substance: realism versus conceptualism

Humean empiricism revived in the twentieth century. For A.J. Ayer, for example, the philosophical notion of substance reflects only a ’primitive superstition’ about names, since nothing is independently there to be named except sense-data, the equivalent of Hume’s impressions (see Ayer 1936). But much present-day philosophy, although influenced by both Hume and Kant, in general denies both that there is anything ineluctable about the way we think about the world, and that anything is simply there to be named. W.V. Quine (1953) expresses this denial in the terms of Russellian logic holding that to be is to be the value of a bound variable. For Quine, ontology is a matter of deciding which types of entity to postulate and quantify over - material objects, events, properties, ’stages’, ’fusions’, ’sense-data’ or what you will - a decision that is not determined for us by reality. The difference between types of entity is a difference between criteria of identity - between what we count as the same individual again (1960). Here a rational decision is simply a pragmatic one (see Quine, W.V. §5; Ontological Commitment). Material objects may fill the fundamental place in evolved natural language, but that is a matter of practical convenience or utility. Indeed, the folk-physics embodied in natural language has been supplanted, unless for everyday purposes, by a physics with no room for the ’bodies’ canonically assigned to the category of substance.

Is the traditional notion of substance therefore dispensable, the manifestation of an illusion engendered by contingent features of natural, everyday language? To suppose so would arguably be to set aside a storehouse of philosophical insight capable of suggesting to us just what can most cogently be brought against a conceptualism like Quine’s. Conceptualism is a ’top-down’ philosophy, taking the structure of our thought and language to be the structure of an imposed theory of interpretation of sensory input such that (contrary to Humean empiricism) even input itself must be conceived of in terms of the theory. Concepts are holistically inter-related, slicing out entities as theoretical postulates of the whole scheme. There are no independently given individuals. Not all conceptualists approve the analogy between natural language and scientific theory. Wittgenstein (1953), for example, invites us to see the structure of language as a product of its employment in, above all, social interaction. But all conceptualists have agreed, since the first modern idealists, that we cannot compare our scheme of notions or beliefs directly with reality. An equally old, still popular conclusion is that we can therefore only aim for coherence, and the total scheme that best anticipates experience.

The stiffest opposition to this aspect of pragmatism has come largely from two directions. Drawing on Kant, Peter Strawson (1958) has constructed a transcendental argument aimed at demonstrating that the distinction between experience of independent objects and merely subjective experience - in effect the distinction between oneself and other things which even the sceptic takes for granted - presupposes that both the individual objects and the individual subject of experience exist, endure, are mobile, and interact in space (see Strawson, P.F. §8; Transcendental Arguments). Whether or not this argument rebuts scepticism (would it not be enough for these distinctions that the subject should *seem to itself* to be so related to bodies in space?), it does offer an explanation of the primacy of the category of substance in natural language, and of the unreality of the suggestion that, but for utility, entities of a different category - events, thing-stages, sense-data or whatever, might have played the basic role. Yet although Strawson disavows an idealism like Kant’s, and presents a powerful alternative to Quine’s

relativism, he does not clearly depart from a ’top-down’, conceptualist picture. Indeed he has talked of his thesis as if it concerned the necessary structure of any conceptual scheme that could be the vehicle of objective experience - the general scheme or order which sensory input must fit, as it were, for there to be experience of objects. Individual substances are necessarily basic, but are picked out only by means of sortal concepts applied to input.

A different line of argument, pioneered by Saul Kripke (1980) and Hilary Putnam (1975), might be taken to refute the idea that our conceptual scheme structures the world for us, rather than being structured by the world. This proposes that, like proper names, names of natural kinds owe their meaning not to some concept in our heads but to their naming what they name. Consequently, ’gold’ on the lips of a present-day physical chemist means the same as an ancient Chinese character, whatever differences exist between the users’ conceptions of, or theories about, the natural kind of stuff that both name. That their words mean the same could not be determined by an inspection of their ’ideas’ or definitions, but would depend on the identity, that is the actual (and, for at least one of them, unknown) common nature, of what each names (see Reference §3). Yet even if this point is taken to undermine the analogy between language and theory, and to demonstrate the possibility of a pre-theoretical naming of things, it does not speak directly to the question of the distinction between what is naturally, and what is only conceptually distinct. For it could be made almost as readily about the general names of natural events, processes or properties as about the names of substances. The term ’freezing’ has the same pre-theoretical grip on a natural kind of process as ’horse’ has on a natural kind of substance, yet the freezing of some water in a glass is not a naturally discrete whole in the way that a horse or, for that matter, a glass is. Although no process is properly freezing unless it shares the common nature of freezing, unknown to most of us, yet a particular instance of freezing is individuated and bounded by the concept, not by nature. Every event or process is part of indefinitely many wider events or processes, and there are no natural, only conceptual, parts and wholes. But a horse is a natural whole, and its hooves and tail are natural parts. Because it has nothing directly to say about boundaries, unity, individuation and identity, the Kripke-Putnam thesis is compatible with conceptualism, as Putnam himself has claimed. David Wiggins (1980) has presented a ’conceptualist-realist’ theory of the identity of substances drawing on Kripke’s insights, but remains firmly within the conceptualist fold.

To rebut conceptualism, therefore, more is needed than a Kantian transcendental argument or the recognition of natural kinds in the Kripke-Putnam sense. It must be shown that reality itself contributes to the way we take the world to be articulated or divided, and this contribution must be distinguished from the contribution of the mind as receptor or interpreter or speculator - from the contingencies of sense-experience, language or theory. The canonical doctrine of substance took it that primitive logical subjects are apprehended as naturally unitary, naturally whole, naturally enduring individuals, prior to their classification by us. Such ‘bodies’ are standardly contrasted with merely notionally distinct and unitary individuals in other categories. Any philosophy of experience, identity and classification must either endorse such a distinction or rule it out: that is, must be either realist or conceptualist.

What reasons are there for adopting a realist, ‘bottom-up’ theory of identity and classification? A non-substantial entity such as an event is not determinately individuated except in virtue of some general concept, commonly a correspondent to nominalized predicate, adjectival or verbal. If standard conceptualist theories of identity were correct, the same would apply to substances. Only in virtue of a quasi-theoretical concept of an *insect*, or insect of a certain type, would it be possible to single out the individual which is in turn egg, larva, pupa and imago. Yet it seems evident that a material object can be picked out without our knowing what kind of thing it is, and that we can then learn from observation what metamorphoses such an object will normally undergo, or can survive. The possibility of refined classification comes with sustained observation of previously identified individuals. To classify substances is to group given individuals. Genera are groups of these groups. There is therefore no question of the individuals of the genus being different from the individuals of the species. This peculiarity of substances lies behind the Aristotelian principle that there are no ultimate species or individuals except in the category of substance. If a class of non-substances, say, *public assemblies*, is divided for some purpose into peaceful ones and violent ones so as to include, say, *demonstrations* and *riots*, then the class of riots is as good a species as the class of assemblies, and the individuals of these classes have different principles of individuation. An assembly exists while people are assembled, but a riot exists only as long as they riot. If an assembly is composed of a demonstration followed by a riot, the assembly, the demonstration and the riot are three distinct individuals. With substances, however, species can be divided without creating new species or individuals, as the species of human

beings is divided almost indefinitely by natural languages. Bakers, adolescents, albinos, diabetics and rioters constitute neither distinct species nor individuals distinct from human beings. Rioters do not cease to exist when they cease to riot, nor children when they grow up. This is not an accidental feature of natural language, modifiable by stipulation. To stipulate identity-conditions for an entity, (say) a *bakens*, such that a *bakens* exists just as long as a baker is a baker, is only to individuate a non-substantial entity such as a baker's practice of baking. The notion of a temporal part or 'stage' has played a central role in twentieth-century conceptualist theories of identity, but what comes to an end when a kitten becomes adult is its kittenhood, a part or stage of its life, not a temporal part of a cat - there is no such thing. 'Kitten' is a compound predicate satisfied by naturally unitary individuals whose identity through time consists in their continuing so united, not in their satisfaction of that or any other predicate. Things which satisfy primitive noun-predicates such as 'cat' do so throughout their existence, but that is because these predicates mark membership of more or less natural groups by origin, morphology and structure. The individuality of the members of the kind is prior to such classification. The unity upon which their continuity depends is the natural discreteness and coherence of a material object: materiality and the possibility of such natural unity go together. In contrast, individual non-substances are notional unities sliced out by general terms; which is why modification of the terms in question breeds new individuals, and new species.

Other considerations relating to identity confirm the contrast between the category of substance and other categories of entity. For example, just as we can literally place a material object in new circumstances, so we can consider what would have happened to it if circumstances had been different. The very same individual might have had very different attributes - that is implicit in our ordinary understanding of a material thing as possessing indefinitely many potentialities. An event or state of affairs or action could not in this way be supposed qualitatively different and yet numerically identical: a possible Battle of Hastings won by the Saxons cannot be the same event as the battle actually won by the Normans.

Realism's strength lies not only in its philosophy of language but in an epistemology which explains how substantial individuals can be 'given' prior to conceptualization. It has traditionally been supposed that the deliverances of the different senses present only qualities which have somehow to be tied together conceptually or theoretically in order that we should conceive of the things or substances that possess them. In the Second Mediation Descartes saw this process as the intellect's employing an innate idea of extended substance in order to think the reality behind appearances, but idealists and some empiricists have seen it as an act of quasi-theoretical construction (see Kant, I. §3; Phenomenalism). Yet the model itself is wrong. That we have several senses does not mean that they are not integrated in their operation, presenting a unified field of bodies in space oriented in relation to our own perceived and perceiving body (that is, ourselves). Indeed, the briefest reflection on the phenomenology of perception supplies instances of such integration not only of sense with sense, but of sense with action. That we can hear a sound close to our ear does not mean that we hear our ear, or infer a relation to our ear from a quality of the sound, but that hearing is integrated with bodily awareness. That prismatic spectacles can invert all the objects in the visual field equally demonstrates that the way we feel our body to be, which includes our feeling it to be upright, can frame the deliverances of another sense. Eye and hand are coordinated in normal subjects because sight, bodily awareness and touch present a single sense-field integrated with the field of action. Here the philosophy and empirical psychology of perception converge, allowing us to understand the possibility of our pre-theoretical, preconceptual apprehension of just those natural individuals, traditional 'substances' that are logically fundamental in natural language. Although such objects are not also, as Aristotle supposed, fundamental in natural science, their unity and structure are there for physics to explain. It is false, then, that the world as we experience it, conceive of it and act within it in ordinary life owes its articulation to the structure of language, theory or 'conceptual scheme'. Rather, thought is shaped by the experienced world, and language owes the possibility of its deepest features, reference and predication, to the senses' grasp of really discrete individuals. That is a lesson that traditional theory of substance can still help to teach us.

Suchon, Gabrielle (1631-1703)

Seventeenth-century rationalist feminist philosopher and author of two books dealing with many moral, social and political issues, Suchon advocated liberty, knowledge, authority and the possibility of an unmarried life for women. In this she did not employ any ready-made philosophy but created her own. Freedom and knowledge are everyone's natural rights, understood as rights that get their strength from themselves only and are to be observed everywhere alike.

Self-taught philosopher, author of a *Traité de la morale et de la politique (Treatise on morals and politics)* (1693) and *Du Célibat volontaire (Of voluntary single life)* (1700), Gabrielle Suchon was born at Semur in Burgundy, France. Forced into a convent, she later went to Rome and got a Papal writ releasing her from her vows. Her family took her to court and the Dijon Parliament ruled that she had to go back to her convent. Evading the sentence she spent the rest of her life reading and writing, 'abandoned of all creatures, but not of my Creator, who gave me the grace not to abandon myself' (1693: XV).

Suchon's *Traité* on morality and politics is valuable as a work of metaphysics, epistemology and theology. Advocating 'liberty, knowledge and authority' for women, the book provides inventive theories about, among other things, 'privation' (described as being productive of effects), natural rights, original sin and constraint. Suchon is not a relativist. Her method implies that looking at women's position with respect to knowledge, liberty, marriage and the like, provides a deeper insight into what those things are in themselves and helps better to judge of their exact values.

Like many others, Suchon was scandalized that schools and universities were closed to women while male 'idiots' had access to them. Yet she considered that personal reflection and use of the seeds of light given by God were most important of all, learning acquired by reading being second. As for knowledge derived from tutors, it is an enjoyable luxury but no more. Furthermore, the original sin was not the transgression of an interdict against knowledge of good and evil: God wanted humankind to know, and Suchon seems not to acknowledge any ban on curiosity. But Adam and Eve should have sought wisdom through their own intellectual effort, rather than seeking a ready-made answer by the facile method of eating an apple. Women can acquire a valuable understanding of moral, political and metaphysical questions by thinking for themselves. Reason is the name of that which enables us to be self-taught people. Although this applies to men and women alike, it can be best demonstrated by first considering women's position and then drawing from this an indication of how things stand in themselves, and so incidentally for men as well.

Knowledge and freedom are everyone's natural rights, natural right being a 'right that holds its strength from itself only and is to be observed everywhere alike' (1693: 23). It is not contingent upon laws or capricious custom. Knowledge and freedom both come into being by being exerted, but there is an interaction between the two. And knowledge is 'beatitude commenced'.

It is a knowledge of values that Suchon ultimately seeks. Why is freedom so good? What different kinds of liberties are most important? What is marriage but an oppression and a burden only a saint's sister could bear? Bad enough in itself, submission becomes so insufferable when one is forced to obey a person with no sense that it requires a special grace to endure the miseries involved. Again Suchon writes this with women's marital duties in mind. But in this second work, *Of voluntary single life*, she considers, as she did in her first treatise, that what is true for women must also to some extent be true for men. After all, male authors have harped on the many vexations of married life.

Suchon makes the female the universal, and her strategy is supported by a linguistic feature in French. The word 'person', which refers to men, women and components of the Holy Trinity alike, is grammatically feminine. It is therefore quite easy for her to have a universal 'she' and constantly to shift from statements concerning women to statements concerning 'persons' and vice versa. Her work is dedicated to the Trinity, again a feminine word in French and, obviously enough, a female power under Suchon's pen.

Nothing is known yet about how Suchon managed to educate herself. Through the authors she quotes, one may surmise what books she had access to: ancient philosophers, (though not all), countless Church Fathers, perhaps

the Scriptures themselves (not obviously a possession for a lay person in Louis XIV's France), some modern authors such as Petrarch, Pascal and Poulain de la Barre (a Cartesian who had published *De l'égalité des deux sexes (On Equality of Both Sexes)* in 1673). Her convent's library may well have been decently furnished, and she did make a point about using whatever little money one has to buy books. The reception of her work is not much known either. Perhaps it was not too bad. Her two books were reviewed in *Le Journal des Savants* in 1694 and 1700, the second one also in *Nouvelles de la République des Lettres*. Long after her death, an entry 'Gabrielle Suchon' appeared in Papillon's *Bibliothèque des auteurs de Bourgogne* (1745).

Suffering

Although sometimes identified with pain, suffering is better understood as a highly unpleasant emotional state associated with considerable pain or distress. Whether and how much one suffers can vary in accordance with any meaning attached to the associated pain or distress, or with expectations regarding the future. Because suffering can be affected by thoughts of meaning or of the future, some have focused on this dimension of suffering and asserted that only humans can suffer. But there is a very strong empirical case that many nonhuman animals suffer. The fact of suffering provokes moral concern, especially when suffering is caused unnecessarily, and raises ethical questions, mainly regarding the nature and extent of our obligations to those who suffer. Suffering is also an important source of personal or religious meaning in many people's lives.

1 Concept

What is suffering? Casual usage sometimes suggests that suffering is identical to *pain*, but surely the pain caused by an ordinary pinch on the arm is too mild to count as suffering. Moreover, pain, but not suffering, can be located in specific body parts. While pain and suffering differ, it is possible to overstate their differences. On the *sensation model*, pain is simply a kind of sensation, which varies in intensity, duration, location, and features that permit classifying it as a particular kind of pain (such as an ache or twinge). On this model, pain need not be at all unpleasant: we may or may not suffer even when we are in great pain, since pain does not necessarily involve an affective dimension. On the *attitude model*, however, pain is any sensation (or perhaps any feeling) we dislike for its own felt qualities, suggesting less conceptual distance between pain and suffering. Each model of pain faces certain theoretical challenges. It seems safe to say, however, that pain is at least typically (whether or not intrinsically) unpleasant, in which case at least most painful experiences involve some degree of affect - a feature shared with suffering, as we will see (see Bodily sensations).

Suffering also bears a close relationship to *distress* but cannot be identified with it. The mild distress of a professor who is late to class need not involve suffering, even if someone having an anxiety attack (a kind of distress) clearly does suffer. Very roughly, distress is an emotional state that can be caused by, or take the form of, various more specific mental states such as fear, anxiety and discomfort.

While any precise analysis of 'suffering' will be controversial, suffering may be understood roughly as *a highly unpleasant emotional state associated with considerable pain or distress*. The words 'associated with' bypass the issue of whether considerable pain or distress *causes* suffering or *is a form of* (or conceptually overlaps with) suffering. Perhaps terror is a form of suffering, not a mere cause. Perhaps excruciating pain in its affective dimension (as opposed to its bodily location) is suffering. One's judgments here will depend on one's specific analyses of these mental states.

Whether and how much one suffers can vary in accordance with attitudes or expectations about the associated pain or distress or about the context in which it occurs. Even the mild pain of a common headache can lead to great distress and suffering if the pain endures with no end in sight, or if the subject believes the headache is a sign of impending physical deterioration. On the other hand, soldiers have sometimes received major injuries yet apparently not suffered much, due, for instance, to the relief of expecting removal from combat, or to positive attitudes to the heroic context of their injury. Long-distance runners who experience pain and discomfort in a race may or may not suffer, or may suffer more or less, depending on such psychological factors as how they evaluate their efforts, and whether they are relaxed or fearful in their attitudes regarding the remainder of the course. Thus any meaning one attaches to one's situation, as well as one's expectations for the future, are important factors in whether and how much one suffers.

2 Subjects of suffering

Who can suffer? Because meaning and expectations for the future are important factors in human suffering, and because nonhuman animals are often thought incapable of assigning meaning and anticipating the future, it is sometimes asserted that only humans can suffer (see Moral standing §2).

This assertion is highly doubtful, however. First, to say that meaning and expectations for the future are important factors in human suffering is not to say either is a necessary condition of suffering. It seems plausible that pouring

scalding water on a human baby would cause suffering, even if the baby could assign no more meaning to the event than a dog could. And even if expectations for the future were necessary for suffering, the thesis that only humans can suffer would depend on the premise that animals have no sense of the future. But it is highly questionable whether the behaviour of ‘higher’ animals, as studied in cognitive ethology, can be adequately understood without attributing at least minimal awareness of time to them.

Because suffering is an emotional state, only sentient beings can possibly suffer. Behavioural evidence, physiological data, and evolutionary considerations together make a strong case that many animals - possibly including most or all vertebrates - are sentient. But there may be sentient animals who cannot suffer, either because they can experience only minimal pain and distress or because they are incapable of highly unpleasant emotional states.

3 Ethical importance

It is generally agreed that suffering tends to make one less well off, due to its intrinsic aversiveness and its instrumental disvalue, the way it interferes with our doing and getting things we want. Suffering is a harm.

Suffering therefore provokes moral concern and raises ethical issues. It often isolates the subject, posing special challenges, for example, to medical professionals and families dealing with infirm elderly persons. When suffering results from human action, it clearly becomes an ethical matter, and virtually every ethical theory or tradition includes some injunction against unnecessary causing of suffering (see Evil). But whose suffering counts? While humans uncontroversially fall under the scope of such an injunction, it is increasingly believed that sentient animals do as well (see Animals and ethics).

Points of controversy include the following. First, when is it ‘necessary’ - that is, justified - to cause suffering? For example, do the products of factory farming justify the suffering caused to the animals? Second, do we have positive obligations to those who suffer and, if so, to what extent? What are our obligations, if any, to famine victims, politically persecuted individuals, and women sold into spousal slavery? Third, what affective capacities and moral virtues are required for appropriate responses to suffering? Can one respond well to a grieving associate without vividly grasping their experience? Could an appropriate response be described without mentioning virtues, such as compassion and sensitivity?

4 Personal and religious meaning

Although a harm, suffering is for many people a source of personal or religious meaning. Those who have suffered extensively often report that their experience has enabled them to appreciate what is truly important in life as opposed to what is superficial and fleeting. Someone who has endured cancer may say that they are now less concerned with personal accolades and more involved in their children’s lives. The experience of suffering sometimes increases one’s sensitivity to others’ suffering. Someone evicted unexpectedly from their apartment and rendered temporarily homeless may better understand and care about the plight of the chronically homeless. It is also often asserted that suffering builds character. A confident individual for whom things always came easily may be devastated by a spouse’s death but, in the aftermath, begin to cultivate courage, perseverance, and humility. Moreover, when suffering provokes a compassionate response from others, this may strengthen the subject’s faith in their fellows. (Sometimes such positive experiences of meaning help to alleviate present suffering (see §1).)

Religious individuals often understand suffering to have a positive aspect or some other important meaning. Priests and monks of various religions may embrace self-denial, the suffering that comes with it, and the virtues such suffering encourages. Christians understand suffering to permit greater identification with Jesus, who is believed to have suffered for the benefit of all, providing a model of virtuous sacrifice. According to Buddhism, suffering results from desire or craving - whether for sensual pleasure, wealth, or even personal ideals - and all desire involves the idea of oneself as separate from other things. Suffering is eliminated by extinguishing desire, through right living, meditation, and the eventual achievement of *nirvāna*, a state of peace and insight in which one abandons the notion of a separate self (see Asceticism).

Suffering, Buddhist views of origination of

The Sanskrit term pratītyasamutpāda *(Pāli,* paṭiccasamuppāda*) literally translates as 'arising [of a thing] after encountering [its causes and conditions]'. This term, conventionally translated as 'dependent origination', 'conditioned co-arising' or 'interdependent arising', signifies the Buddhist doctrine of causality. This doctrine is usually applied to explain the origin of suffering (*duḥkha*) as well as the means of liberation from it. According to the Buddhist tradition, the Buddha discovered the law of dependent origination during his meditation on the night he attained his awakening. According to traditional accounts, he saw all his former lives and the lives of all other beings, understood the principle governing transmigration, and found the way of liberation. He then formulated the so-called Four Noble Truths, the Eightfold Noble Path and the Law of Dependent Origination. The twelve elements of the chain of dependent origination were designed to explain the mechanism of entanglement of a sentient being in a wheel of consecutive lives, and, at the same time, to explain how this entanglement is possible without admitting the concept of a permanent principle, like 'self', 'ego', and the like. These twelve members are: (1) ignorance, (2) formations (volitional dispositions), (3) consciousness, (4) name and form, (5) six bases of cognition, (6) contact, (7) feeling, (8) desire, (9) attachment, (10) existence, (11) rebirth, (12) ageing and death. In addition to the twelvefold formula, there is also the so-called 'general formula' of dependent origination, which goes 'when this is, that arises; when this is not, that does not arise.'*

1 Canonical accounts

The Buddhist tradition has it that Prince Siddhārtha Gautama, after a prolonged meditation under the bodhi tree, attained enlightenment or awakening (*bodhi*), the ultimate understanding of the Four Noble Truths: (1) there is suffering, (2) there is a cause of the arising of suffering, (3) there is an extinction of suffering, and (4) there is a means to come to the end of suffering. The means is to follow the so-called middle path between the extremes of self-indulgence and self-mortification. This fundamental teaching was expounded in the Buddha's first sermon, the so-called 'Sermon of the Turning of the Wheel of the Law' (*Dhammacakkapavattana Sutta*) (see Buddha).

The second of the Noble Truths, the Noble Truth of the Arising of Suffering, is often explained in terms of the twelvefold law of dependent origination. The twelve members of the chain of dependent origination are: (1) ignorance, (2) formations (volitional dispositions), (3) consciousness, (4) name and form (body and mentality), (5) six bases of cognition (sense faculties), (6) contact (of sense faculty with sensible object), (7) (physical and mental) feeling, (8) desire, (9) attachment, (10) existence, (11) birth, (12) old age and death. Each member of this sequence is conditioned by what precedes it. The doctrine is commonly regarded as the fundamental teaching of the Buddha, together with his teaching on the Four Noble Truths and the Eightfold Noble Path. An often-quoted canonical passage says that 'He who sees dependent origination sees the Doctrine (*Dharma*; Pāli, *Dhamma*); he who sees the Doctrine sees dependent origination' (*Majjhima Nikāya* 1.190-1). Elsewhere it is said that one who sees the Doctrine sees the Buddha. Thus, to see the principle of dependent origination is equivalent to seeing the Buddha. From the very beginning, this doctrine was regarded as the most profound and difficult teaching of the Buddha.

Some traditional texts declare that the law of dependent origination exists independently of whether Tathāgatas, those who know the truth, appear in the world to discover it. According to these texts, the law of dependent origination is rediscovered each time by the present *buddha*, as an old deserted city hidden in the jungle is discovered by a traveller. Śāriputra, one the most prominent disciples of the Buddha, was converted to his teachings by means of a single stanza uttered by Aśvajit (Assaji), one of the five first disciples: 'All things are born of causes, and of these the Tathāgata has proclaimed the cause, and their extinction too: thus does the Great Ascetic speak' (see Takasaki 1987: 72). This stanza summarizes the law of dependent origination, the very core of the Buddha's teaching on the causal character of the phenomena of existence. It later became regarded as a kind of Buddhist credo.

Research by Lamotte (1980) has shown that the Buddhist sources are not unanimous as to the moment of the discovery of dependent origination by the Buddha and its place within his doctrine. According to some texts, the Buddha acquired a full comprehension of the twelve-membered chain of dependent origination before the attainment of enlightenment, while other texts place the event during or after the enlightenment.

The notion of suffering (*duḥkha*) has in Buddhism an existential dimension and extends over all aspects of human life in this world. Everything existing is produced from causes, is momentary and devoid of a 'self' (that is, of any permanent unchangeable principle), and therefore is painful. Since the Buddhist doctrine denies any permanent principle like a soul, self or ego that transmigrates by virtue of previously committed actions from one life to another, it is admitted that a 'human being', a 'person' is but a conventional designation of a conglomerate of various factors, which appear in a stream of five groups of psychical and physical existential phenomena, and which are mutually conditioned and regulated by the law of dependent origination. A full insight into the twelve members of the chain of dependent origination, and into the extinction of consecutive members, brings realization of the ultimate goal of Buddhism, attainment of buddhahood.

According to Frauwallner's hypothesis, it is possible to demonstrate that the chain of dependent origination has a composite character; the twelvefold chain could have been compiled by the Buddha himself from two shorter causal chains. Also, the so-called *Pratītyasamutpādasūtra*, a fundamental canonical exposition of the doctrine, is to be regarded as a later compilation (Frauwallner 1956). This text was the object of a lengthy commentary by the fifth-century Buddhist philosopher Vasubandhu.

One can also show that beside the twelvefold chain of dependent origination there existed in the canonical texts other causal sequences, in which are clearly visible the components known to us from the former sequence. The final formulation of the doctrine seems to have been completed only after a long process of compilation which may have lasted until the great schism within the Buddhist order, perhaps shortly before Aśoka (middle of the third century BC).

2 Scholastic interpretations

The doctrine of dependent origination has been variously modified and interpreted within the schools of Buddhism. Usually it is applied to explain an individual human life in three time periods: past, present and future. Vasubandhu's *Abhidharmakośa (Treasury of the Doctrine)* (3.20-) presents several classifications of the twelve members of dependent origination (see §1). Vasubandhu distributes the twelve items into three periods of time: (1) and (2) belong to the past, (3) to (10) to the present, and (11) and (12) to the future. Alternatively, there is a twofold division of the members, whereby (1) to (7) belong to past existence, and the remainder to future existence. From the point of view of karma, (1), (8) and (9) are regarded as defilements that predispose one to karma, (2) and (10) are regarded as actions (karma itself), and the remaining seven members are regarded as supports of the defilements and actions.

The Pāli canonical *Mahātaṇhāsaōkhayasutta (Great Discourse on Destruction of Desire)* juxtaposes the theory of dependent origination and another explication of entanglement in the painful world, namely the theory of *gandhabba* (Sanskrit, *gandharva*), an immaterial being that acts as a bridge for human beings from one incarnation to another. The text describes the consecutive stages of conception, embryonic development, birth, growing up and sensual contact with the outer world, which result in origination of the whole mass of suffering. Conception takes place when mother and father are sexually united, when the mother is ovulating and when a *gandhabba* is present. When the child is born, its senses mature, and it amuses itself with the pleasures of the senses. It becomes attached to pleasant experiences and vexed by unpleasant ones. This delight in feelings is attachment; conditioned by attachment, there is desire for further becoming; conditioning by this desire, there is birth; conditioned by birth, there is old age and death, and also sorrow, lamentation, pain, grief and despair. Such is the origin of this whole aggregate of suffering, without any permanent 'soul' or 'self' or any other unchangeable principle.

The fusion of the theory of an intermediate immaterial being and the theory of the twelve links of dependent origination is mentioned in Vasubandhu's *Abhidharmakośa* (ad 3.15a-b; 3.19). His *Abhidharmakośa* (ad 3.28ab) contains the Sarvāstivāda interpretation of dependent origination, which is outlined in as follows. A fool who does not comprehend that the world is nothing more than a collection of mutually dependent phenomena develops a false notion of a self. He performs bodily, vocal and intellectual actions with the intention of experiencing pleasure. He performs beneficial deeds in the hopes of securing a better future life. He may perform harmful deeds in order to secure short-term gains. In this way he accumulates karma conditioned by ignorance. His stream of consciousness, forced by his previous karma, goes from one destiny to another in the same way that a flame 'moves'; in reality there is no motion, but merely the arising of contiguous moments, each caused by its predecessors. At death of the body, the predisposition to survive continues, so the stream of consciousness seeks

out a new body in which to dwell. In this way karma gives rise to new consciousness. When it finds a new body, consciousness conditions the acquisition of body and mentality. When these mature, sense faculties arise. These come into contact with sensible objects, giving rise to pleasant or unpleasant feelings. From these feelings there arises craving. Pleasant experiences give rise to a craving for pleasure to continue, while unpleasant experiences give rise to a craving for discomfort to end. These cravings are the condition for the development of clinging to false views and belief in (or hope for) an enduring self. This clinging conditions desires for future existence, as a result of which there is birth. From birth there inevitably follows ageing and death (see Mejor 1991: 96-7).

3 Mādhyamika and Yogācāra

With Nāgārjuna (second century), the founder of the Mādhyamika school, the theorem of dependent origination acquired a central position. The full comprehension of dependent origination is tantamount to comprehension of the Four Noble Truths: 'Whoever comprehends dependent origination also comprehends suffering, its arising, its ceasing and the path' (*Mūlamadhyamakakārikā(Fundamental Treatise on the Middle Path)* 24.40). The ultimate elements of being arise from causes. They are mutually conditioned, are dependent on others, and thus, devoid of any kind of self-nature, they have no real existence of their own. Whatever exists that has originated dependently is said to be empty (*śūnya*). Therefore, dependent origination is tantamount to emptiness (*śūnyatā*) (see Buddhist concept of emptiness). All names are but conventional designations, for ultimately they refer to no real existents. Discrimination of the two truths, conventional and ultimate, shows the equality of the emptiness and dependent origination of the elements of being. Nāgārjuna says: 'We say that dependent origination is emptiness. That is dependence upon convention. That itself is the middle path' (*Mūlamadhyamakakārikā* 24.18).

In the Yogācāra school, the functioning of twelvefold dependent origination is applied to the transformation of consciousness. According to Vasubandhu's exposition of the doctrine of 'ideation-only' (*vijñaptimātra*), all distinctions between subject and object are due to the threefold transformation of consciousness, which itself depends on various causes. Thus, the transformation of consciousness is but an ideation, a false imagining of subject and object, and all this is a mere representation of consciousness. As the sixth-century Yogācārin philosopher Sthiramati states in his commentary on Vasubandhu's *Triṃśikā(Thirty Stanzas)*:

> No cognizable object exists in reality, because it is in its nature wrongly imagined. Further, consciousness does not exist substantially, because it is dependently originated. So it is assumed. Further, the dependent origination of consciousness is known under the term 'transformation'.
>
> (commentary on stanza 1; see Vasubandhu, ed. Levi 1925)

In other words, the process whereby the elements of being arise and accumulate is a process of obscuration or defilement of thought. And this is dependent origination in its ascending order; that is, beginning with consideration of ignorance, one realizes that it conditions volitions, and so forth through the cycle of conditions to birth and its inevitable consequences of ageing and death. The reverse process of purification of thought is dependent origination in descending order, leading to final liberation; that is, realizing that there would be no ageing and death without birth, no birth without the desire to continue being, and ultimately none of this without ignorance, one knows that one must eliminate the ignorance that takes the form of imposing a distinction between subject and object upon experience as a whole (see La Vallée Poussin 1913: 65).

In the Perfection of Wisdom (*Prajñāpāramitā*) literature, the contemplation of dependent origination is included in the practice of a *bodhisattva* who aspires to perfection of wisdom. In this literature, it said, for example, that the *bodhisattva* should aspire to realize that no phenomenon whatsoever is produced without a cause. On seeing this, the *bodhisattva* will know that nothing is permanent, and nothing is spared eventual extinction. On seeing this in turn, he will see no item of experience as a self, a being, a soul, a creature, a human being, a person, a youth, a personality, an agent, one with feelings, one who knows or one who sees. If the *bodhisattva* does not see experience in these terms, he will not see experience as either permanent or impermanent, as pleasant or unpleasant, or as 'self' or 'other' (see Conze 1984: 491).

Suicide, ethics of

Suicide has been condemned as necessarily immoral by most Western religions and also by many philosophers. It is argued that suicide defies the will of God, that it is socially harmful and that it is opposed to 'nature'. According to Kant, those who commit suicide 'degrade' humanity by treating themselves as things rather than as persons; furthermore, since they are the subject of moral acts, they 'root out' morality by removing themselves from the scene.

In opposition to this tradition the Stoics and the philosophers of the Enlightenment maintained that there is nothing necessarily immoral about suicide. It is sometimes unwise, causing needless suffering, but it is frequently entirely rational and occasionally even heroic. Judging by the reforms in laws against suicide and the reactions to the suicides of prominent persons in recent decades, it appears that the Enlightenment position is becoming very generally accepted.

1 The horror of suicide

The word 'suicide' is used here in the sense defined by Emile Durkheim (1897), the leading sociological writer on the subject. He refers to 'all cases of death resulting directly or indirectly from a positive or negative act of the victim himself, which he knows will produce this result' (see Durkheim, E. §3). The question of whether suicide can ever be morally justified has been extensively discussed both by secular philosophers and by religious moralists. According to Plato, Aristotle, St Augustine, St Thomas Aquinas, Kant and Hegel suicide is always morally wrong, although Plato inconsistently allowed some exceptions. According to another tradition which goes back to Epicurus and the Stoic philosophers, suicide is not only frequently justified but on occasions highly admirable. 'Against all the injuries of life', wrote Seneca, 'I always have the refuge of death'. The Stoic view was revived in the sixteenth century by Montaigne and it had the support of all the leading figures of the French Enlightenment, notably Montesquieu, Holbach, Diderot, Rousseau and Voltaire. David Hume's 'On Suicide', which could not be published during his lifetime, may be regarded as the classic statement of the Enlightenment viewpoint. In Germany in the nineteenth century the Enlightenment position was championed by Schopenhauer and also by Nietzsche, who even went so far as to suggest that chronically sick people should be encouraged to commit suicide. 'In a certain state', Nietzsche wrote in *Twilight of the Idols* (1888: §36), 'it is indecent to live longer - to go on vegetating in cowardly dependence on physicians and medications, after the meaning of life… has been lost, ought to prompt a profound contempt in society'.

In the past, the anti-suicide viewpoint was frequently stated with extreme ferocity. Entirely typical of sermons in the eighteenth and nineteenth centuries is *The Guilt, Folly and Sources of Suicide* by Samuel Miller D.D., delivered and published in New York City in 1805. According to Miller suicide is 'repugnant to every genuine feeling of human nature'. It is 'as degrading as it is criminal'. It is a crime of 'complicated malignity' against which 'man, depraved, afflicted, and covered with evil, requires to be guarded by restraints'. The person who commits suicide 'is as great a monster in morals as an atheist in religion, or as the most hideous assemblage of deformities in animal nature'. Writing in 1908, the English poet and novelist G.K. Chesterton (1874-1935) declared suicide to be the worst of all crimes. 'Not only is suicide a sin', according to Chesterton, 'it is *the* sin. It is the ultimate and absolute evil…. The man who kills a man, kills a man. The man who kills himself, kills all men; as far as he is concerned he wipes out the world'. It is of some interest to note that the Talmud contains a similar idea. We are told that 'there is none more wicked than one who has committed suicide'. This is so because the world was created 'for the sake of one individual' and 'thus he who destroys one's soul is considered as though he had destroyed the whole world' (see Bioethics, Jewish §3).

If we take Chesterton literally, then Cato, Brutus, Cassius, Thomas Chatterton, Samuel Romilly, Heinrich von Kleist, Gerard de Nerval, Ludwig Boltzmann, Vladimir Maiakovskii, Wilhelm Stekel, Stefan Zweig, Ernest Hemingway, Percy Bridgman, Sylvia Plath, Paul Celan, Marilyn Monroe and Arthur Koestler, to mention just a few, were criminals; and indeed far worse criminals than mass murderers. Hitler's extermination of millions of innocent men and women was a lesser crime than his own eventual suicide. Chesterton did not at all deplore the 'weird harshness' that Christianity has shown to the suicide: 'The suicide is ignoble… he is a mere destroyer; spiritually, he destroys the universe'. We are assured that there is much rational and philosophic truth in the

practice of driving stakes through the bodies of suicides and burying them at crossroads. The suicide 'was so bad that his bones would pollute his brethren' (Kant [1775/80] 1930: 151).

Miller and Chesterton may be dismissed as religious fanatics and marginal figures. Immanuel Kant was not a religious fanatic and can hardly be dismissed as a marginal figure, but his denunciations of suicide are just as furious. According to Kant 'suicide is in *no* circumstances permissible'. The man who commits suicide 'sinks lower than the beasts'. We 'shrink from him in horror'. 'Nothing more terrible can be imagined'. 'We look upon the suicide as carrion'. If a man attempts suicide and survives, he has in effect 'discarded his humanity' and we are entitled to 'treat him as a beast, as a thing, and to use him for our sport as we do a horse or a dog'.

None of these writers showed the slightest compassion for a person who committed suicide, and their ravings were directed even against philosophers who did show such compassion and who denied that suicide was necessarily wrong or criminal. Hume in particular was denounced by clerical enthusiasts. G. Clayton, author of *The Dreadful Sin of Suicide* (1812: 48n), called Hume's essay a 'source of incalculable evil', and in a huge treatise, *A Full Inquiry into the Subject of Suicide* (1790 vol. 2: 54), Charles Moore denounced Hume as 'a more pernicious and destructive member of society than even the profligate and abandoned liver'.

2 Humans as God's property

According to Sir William Blackstone (1723-80), the influential English jurist, the suicide is guilty of a double offence. The first of these is 'spiritual' and consists in 'evading the prerogative of the Almighty, and rushing into his immediate presence' (Blackstone 1765-9 IV: 189). We evade God's prerogative, according to some theologians, because we are God's property and he alone has the right to terminate our lives. This argument is found in Plato's *Phaedo* (61c) where Socrates remarks that humans are 'the possession of the deity' and ought not to kill themselves before the deity lays them under a necessity of doing so: 'if one of your slaves were to kill himself, without your having intimated that you wished him to die, should you not be angry with him, and should you not punish him if you could?' This argument is repeated, almost verbatim, by Aquinas and also by Kant.

Kant relies primarily on purely secular arguments, but at the end of his most extended discussion of suicide he also appeals to the Divine ownership of man. 'We have been placed in this world', he writes, 'under certain conditions and for specific purposes. But a suicide opposes the purpose of his Creator; he arrives in the other world as one who has deserted his post; he must be looked upon as a rebel against God'. Human beings 'are sentinels on earth and may not leave their posts until relieved by another beneficent hand' (Kant [1775/80] 1930: 154). This notion had already been put forward in Locke's *Second Treatise on Civil Government*. We are there told that all are the 'servants of one sovereign Master… they are His property' and must not 'quit their station wilfully' (Locke 1690: §6).

The views just quoted are frequently accompanied by pronouncements that God created human beings primarily for his glory. Zachary Pearce (1690-1774), Bishop of Rochester, may be taken as a typical representative of this position. In his 'Sermon on Self-Murder' (1736), he declares that God had two ends in view when he created humans. These 'could have been no other than… the promoting of His own Glory and Service, and of our true and real happiness'. We promote God's glory 'by the practice of every virtue'. Patience and submission to the Divine Will are virtues that are 'chiefly exercised in a state of adversity'. From all of this it clearly follows that suicide is impermissible. 'The greater the adversity, the more conspicuous these virtues appear', and it follows 'very plainly' that 'the most afflicted man is capable of advancing the honour and interests of his Maker'.

All these arguments are open to a number of serious objections, even if one allows that the universe was created by God. In the first place, the fact that God created human beings does not mean that they are his property. My parents created me, but I am not their property. Similarly, the assertion that God presented me with the gift of life does not imply that I may not dispose of it in any way I please. A donor surely has no right to dictate to the recipient what they are to do with the gift. It might also be observed that human beings did not request the gift of life. Schopenhauer in one place remarks that many a human being 'would have declined such a gift if he could have seen it and tested it beforehand' ([1818] 1883, vol. 3: 390).

Another objection relates to God's perfect goodness and wisdom. It is not easy to see why such a being would be so concerned about his own glory, gripped by what Hume called 'one of the lowest of human passions, a restless appetite for applause' ([1777] 1965: 300). Nor is it at all obvious that a human being in a state of extreme physical

or mental agony, especially with no relief or improvement in sight, would be promoting God's glory by continuing to live. Moreover, if God is good and kind he will hardly wish human beings to suffer for *his* sake.

Furthermore, although it is, according to Kant, 'God's intention to preserve life', this is apparently consistent with human life being destroyed by all manner of causes other than by suicidal acts. Why is it not equally consistent with the latter? Kant remarks that 'human beings are sentinels on earth and may not leave their posts until relieved by another beneficent hand' (Kant [1775/80] 1930: 154). Why cannot the desire to die on the part of a person whose 'patience', in Hume's words, has been 'overcome by pain and sorrow' qualify as one of the manifestations of such a 'beneficent hand'? In such a situation, Hume adds, 'I may conclude that I am recalled from my station in the clearest and most express terms' ([1777] 1965: 301). If it is remembered that 'relief by the beneficent hand' may take such forms as cancer or murder at times when the person very much *wishes to live*, it is not easy to see that committing suicide when the individual does not wish to live will not also qualify as relief by the same hand.

3 Adverse effects on survivors

As mentioned above, Sir William Blackstone condemned suicide as a 'double offence'. The first, the 'spiritual' offence, was discussed in the previous section. The second offence is 'temporal, against the king, who hath an interest in the preservation of all his subjects'. This argument is found in Aristotle's *Ethics*, and stated more fully by Aquinas who writes:

> It is altogether unlawful to kill oneself, because every part, as such, belongs to the whole. Now every man is part of the community, and so, as such, he belongs to the community. Hence by killing himself he injures the community.
>
> (*Summa theologiae* IIaIIae.64.5)

Some writers have been less concerned with harm to the community than with the grief and suffering that a suicide may bring to friends and family. 'It is not wisdom but barbarity', in the words of the great Italian poet-philosopher Giacomo Leopardi ([1827] 1893: 225), 'to reckon as nothing the grief and anguish of the home circle, the intimate friends and companions'.

A little reflection shows that such considerations fail to establish the conclusion that suicide is always wrong. The most they show is that a responsible individual would carefully take into account the effects on others before taking such a drastic step. One need not deny that an individual has obligations to society or to family and friends. However, apart from the fact that some people have neither family nor friends and that some people are justly aggrieved against the society in which they live, there are two objections to all arguments of this kind. In the first place, in any number of situations, a person's welfare may rightly take precedence over obligations to others. If by suffering a little, a person can avoid a great deal of suffering on the part of friends and family or the whole of society, his suffering is justified. If, on the other hand, the continuation of the person's life involves terrible pain, far exceeding the sufferings which their suicide would produce on other people, the person is not obliged to go on living. Hume discussed this topic at some length. Allowing for the sake of argument, he writes, 'that our obligations to do good (to society) were perpetual, they certainly have some bounds; I am not obliged to do a small good to society at the expense of a great harm to myself' (Hume [1777] 1965: 304). In a great many cases, furthermore, a person who commits suicide acts, at least in the long run, for the *benefit* of others. Although death may produce grief it also produces relief. 'Suppose that it is no longer in my power to promote the interest of society', Hume writes, 'suppose that I am a burden to it; suppose that my life hinders some person from being much more useful to society; in such cases, my resignation of life must not only be innocent, but laudable'. Since we are here dealing with utilitarian considerations it may not be amiss to observe that the suicide of a malevolent tyrant may bring great joy to large numbers, and not only to those he has harmed. Millions of people were happy to hear of Hitler's death, but the fact that he committed suicide gave greater satisfaction than if he had died of cancer or heart disease: it was, in effect, an admission of defeat.

4 An offence against nature

One of the most widely used arguments against suicide is that it is opposed to 'nature'. Thus, in a much-quoted judgment, Mr Justice Brown in 1562 declared suicide to be a crime on the ground that it is 'an offence against nature: because to destroy oneself is contrary to nature, and a thing most horrible'. In Aquinas the appeal to nature

is the first of his three reasons for condemning suicide. Suicide, he tells us, ‘is contrary to the inclination of nature and to the charity whereby every man should love himself’ (*Summa theologiae* IIaIIae.64.5). It follows from this that suicide is ‘always a mortal sin’. The argument is also found in numerous Protestant tracts of the eighteenth and nineteenth centuries. Samuel Miller employs his usual hell-fire rhetoric. ‘Suicide is repugnant to every genuine feeling of human nature,’ he tells us. ‘It is an outrage on the dignity of those faculties with which the Author of Nature has endowed us’. Although most writers who used this argument were believers in God and also employed theological arguments, the appeal to nature is meant to be of a purely secular character. Leopardi, a total atheist, expressed himself in similar language. ‘Nature itself’, he wrote, ‘unmistakeably teaches that it is not permitted to quit this world by our mere will and our own act’. It is implied that if humans were to cut off their arms or pluck out their eyes, this would be horrendously unnatural. Such acts, however, are not nearly as unnatural as to extinguish one’s very life. Such an act is ‘the one most opposed to nature which a person can commit’ (Leopardi [1827] 1893: 215).

The sufficient answer to this argument is that the suppression of an instinctive urge is not necessarily wrong. A surgeon who gets extremely hungry in the course of an operation can surely not be blamed for suppressing a passionate desire for a roast beef sandwich. Furthermore, instinctive desires may and frequently do conflict with one another, and then the right action, whatever it is, will have to frustrate our instincts. It may be granted that our desire to continue life is natural, but it is just as natural to avoid intolerable pain with no relief in sight. In such a situation suicide may be no less ‘in accord with nature’ than continuing to live. The best comment on the arbitrariness of the orthodox position has come from Henry Romilly Fedden in *Suicide - A Social and Historical Study* (1938). ‘A monk’, Fedden writes, ‘denies sex, the suicide disregards self preservation: both should be equally guilty, yet one is a saint and the other a sinner’ ([1938] 1972: 282).

5 Kant’s arguments

Kant appeals not only to the alleged fact that man is God’s property for his blanket rejection of suicide. He also offers a number of purely secular arguments. Two of these deserve some discussion. According to one of these, people who commit suicide are ‘abasing’ and ‘degrading’ their humanity by treating themselves as no more than things:

> Man can only dispose of things; beasts are things in this sense; but man is not a thing, not a beast. If he disposes of himself, he treats his value as that of a beast. He who so behaves, who has no respect for human nature makes a thing of himself.
>
> (Kant [1775/80] 1930: 151)

Kant is surely wildly wrong here. I am treating people as things and debasing their humanity if I try to dominate them so that they will, under the force of my superior will, automatically do what *I* want. Setting aside the notion of treating somebody as a thing, it is unquestionable that people frequently debase other human beings. I am debasing people if I humiliate them, if I get them to the point at which, to preserve their jobs which I control, they have to fawn and beg for mercy or to confess to wrongs they never committed. In such circumstances I have no regard for the others’ feelings, especially for their pride and dignity. In reply to Kant it must be emphasized that a great many cases in which people committed or attempted to commit suicide do not at all resemble debasements of this kind. If I commit suicide I am not necessarily the victim of the stronger will of somebody else. I am not indifferent to my own feelings or dignity, but on the contrary I may *compassionately* decide to terminate what I regard as my pointless (perhaps even degrading) suffering. I have not become a thing and I have not at all debased myself.

Kant’s other argument is based on the undeniable fact that if people commit suicide they can no longer perform any moral acts. ‘It cannot be moral’, he says, ‘to root out the existence of morality itself from the world’. The suicide ‘robs himself of his person. This is contrary to the highest duty we have towards ourselves, for it annuls the condition of all other duties’ (Kant [1775/80] 1930: 152). To this it must be replied that people who commit suicide do *not* root out the existence of morality itself from the world. They do not do so any more than when they die a natural death or are killed in battle. They ‘root out’ any new moral acts on their part, but presumably there will be other people left. They would root out ‘morality itself’ only if they wiped out the human race.

Kant’s argument involves a confusion between: (1) I ought to do my duty as long as I am alive, and (2) It is my

duty to go on living as long as possible. Kant's basic value judgment that doing one's duty is the highest good implies (1), but it does not imply (2); and only (2) could serve as a basis for condemning suicide.

It should be noted that Kant himself in various places rejects statement (2). In one place he remarks 'there is much in the world far more important than life' and that 'it is better to sacrifice one's life than one's morality'. Furthermore, it is entirely permissible and even laudable 'to risk one's life against one's enemies, and even to sacrifice it, in order to observe one's duties towards oneself'. Kant also fully endorses the right of 'the sovereign' to 'call his subjects to fight to the death for their country'. Those who die in battle, Kant goes on, are not suicides but 'victims of fate'. They are to be admired as 'noble and high-minded' in contrast with soldiers who run away to save their lives. Yet the deaths of the noble 'victims of fate' root out the existence of 'morality itself' from the world just as much as the deaths of people who commit suicide, while cowardly soldiers who saves their own lives thereby preserve the condition for further moral action. Hence the mere fact of not preserving the presupposition of future moral action cannot be a sufficient reason for condemning suicide.

6 The legal punishment of suicide

Until relatively recently suicide was regarded as a capital crime in the legal statutes of most Western countries. Unfortunately from the point of view of the punishers, it is not possible to carry out a death sentence in the case of successful suicides. This does not mean, however, that nothing has been done by the state or church to show their extreme disapproval. The suicide was declared a felon and their property confiscated. Regular burials were strictly forbidden and Christian rites denied. The body was usually taken to the crossroads, a stake driven through it and a stone placed over the face. The Prussian Code published in 1788 and confirmed in 1794 declares that 'the corpse of a suicide shall be duly executed, if, in the opinion of the judge, the act would operate as a deterrent'. Such laws are perhaps not as absurd as they appear at first. Most people, almost regardless of their philosophical or religious views, are concerned about the disposition of their body and repelled by the notion of its mutilation.

In the case of suicides whose attempts fail, the authorities were in a position to carry out the execution of the 'murderer'. It is not known how often this was actually done but we have an appallingly gruesome description of one such case that took place in England in 1860 (Carr 1981: 336).

Laws against suicide were abolished in France in 1790 largely as a result of the influence of Beccaria, Montesquieu, Diderot and Voltaire. Other European countries and several US states followed the lead, but in Britain people were prosecuted as recently as 1955. Several of these cases are described in Glanville Williams (1958). The 'criminality' of attempted suicide was finally abolished in Britain in 1961 following a recommendation (1959) by a commission appointed by the Archbishop of Canterbury. Much of the report repeats, in very strong language, some of the older Christian condemnations, but in the end, after quoting extensively from the writings of Hastings Rashdall, Dean Inge and Canon Peter Green, it is grudgingly admitted that, in certain situations, suicide is not immoral.

Assisting suicide remains a crime in thirty-two US states but, as is generally known, such prohibitions are commonly disregarded by humane physicians. Dr Jack Kevorkian, a Michigan pathologist, has openly defied this law. He has been tried several times and acquitted on each occasion. In two (April and May 1996), one in New York City, the other in San Francisco, Courts of Appeal found statutes forbidding physician-assisted suicide to be unconstitutional. Both cases are under appeal at the time of writing, but there is every indication that, before long, physical-assisted suicide will be regarded as a constitutional right.

Sunzi

Sunzi: The Art of Warfare (or Sunzi bingfa), a text traditionally ascribed to Sun Wu, a contemporary of Confucius, is the most widely read military classic in human history. Although it provides counsel on military strategy and tactics, it is fundamentally a philosophical text, reflecting a way of thinking and living that is distinctively Chinese. The received text has thirteen 'core' chapters, but in 1972 an additional six chapters of the original eighty-two-chapter text was recovered from a Han dynasty tomb. In the same tomb, a text called Sun Bin (or Sun Bin bingfa), ascribed to a later descendent of Sun Wu, was also recovered. This work elaborates on the substance of the Sunzi's military philosophy.

In the centuries leading up to the founding of the Chinese empire in 221 BC, death had become a way of life and military texts were among the most widely circulating documents. The *Sunzi* and *Sun Bin* date from what is aptly called the Warring States period (403-221 BC), a period in which the heat and ferocity of warfare among independent nation-states, caught up in the frenzy of zero-sum politics, was rising exponentially. Historical records report that, between 350 and 250 BC, the approximate dates for the *Sunzi* and *Sun Bin* respectively, average battle casualties rose from 30,000-40,000 to ten times that number.

Many factors contributed to the carnage, including widespread use of the crossbow, siege engines to attack increasingly important population centres, advances in metallurgy and the introduction of cavalry. But in the final analysis, the revolution was intellectual. During this period, loosely organized militia gave way to the use of fixed formations, creating unrelenting killing machines similar in concept to the Roman phalanx, the revival of which in modern Europe made the Napoleonic armies so formidable.

The key and defining idea in the *Sunzi* is *shi* (pronounced like the affirmative, 'sure!'), translated variously as 'circumstances', 'situation', 'power', 'strategic advantage' and 'military or political purchase'. *Shi* entails manipulating circumstances to create a strategic advantage. It separates the skilful manipulation of a situation from brute force, and military wisdom from mere physical prowess.

An exploration of *shi* provides a contrast between an agent-centred model of order which tends to emphasize linear efficient cause, and the more situationally-defined alternative. When *shi* is translated as 'strategic advantage', many readers move immediately to assign it to one side of the conflict or the other. *Shi*, however, refers to the synergistic relationship that obtains among all of the factors on both sides of the conflict (numbers, terrain, logistics, morale, weaponry and so on) as they converge on the battlefield to give one side the advantage over the other. It is the tension generated in the contest between surplus and deficiency that becomes the 'force of circumstances'. *Shi* is both the shape and the momentum that the encounter assumes: it is the tide of battle. It is the purchase and the leverage that gives troops the will to join the battle and to win it.

Shi is thus not a given; it must be created and carefully cultivated. A failure to cultivate *shi* will surely give the upper hand to the enemy, and even the best soldiers under the worst circumstances will turn and flee. What makes cultivation of a situation possible are the indeterminate elements. At the same time, these ever-present fluid factors make each battlefield unique, and render any formulaic or mechanical application of even a proven military stratagem ultimately unreliable. Indeed, each new situation that develops in the field brings with it the necessity for reconsideration, and a flexibility that must constantly be ready to take account of any eventuality. It is this indeterminacy that makes the range of available strategies limitless.

The capacity of the small, incipient and seemingly incidental to control the large by virtue of its pivotal position is an enduring theme in classical Chinese philosophy, and underlies the notion of getting the most from a situation while minimizing loss. The commander must search the circumstances to identify a 'trigger' that can alter the propensity of battle. In this sense of order, this initially indeterminate aspect, while relatively small, can become a motivating force for reorganization and renewal, thus constituting a critical turning point. Because uncertainty can provide the occasion for transformation, it can offer either 'danger' or 'opportunity', depending upon whether or not the commander is able to capitalize on the moment and make the most of it. In fact, in modern Chinese, the combination of 'danger' and 'opportunity' - *weiji* - means 'critical point'.

In the *Sunzi*, the prosecution of warfare must imitate nature, and nature is too complex to be linear and

scale-invariant. Reconfiguration can take place on the battlefield in the same way that renewal can occur in nature because both situations are fluid, and rich in disorder and surprise. Small, pointed alterations can have precipitous and cascading consequences. Rather than separating what orders from what is ordered, this dynamic sense of order locates the energy of change within the situation itself by assuming order to be richly vague, ever-changing and always unique. When understood in this way, order is reflexive: it is self-organizing and self-renewing. While the stabilizing regularity of a specific event anticipates the way in which it will continue to unfold, the chaotic aspect within the event itself defeats any notion of necessity or absolute predictability. The combination of pattern and uncertainty in nature and on the field of battle undermines the possibility of universalizable claims and renders precarious any globalizing generalizations. All the commander can depend upon is the *relative* stability of site-specific and emerging patterns of order, and enough knowledge of the situation to identify and act upon the positive uncertainties that present themselves. He must constantly weigh the stochastic variables at every level of the battle and be prepared to parlay them into large scale advantages.

In the sequel text of the same lineage, the *Sun Bin*, the meaning of *shi*, a rather complex idea, was subcontracted out to other technical terms, a cluster of images which became evocative in both communicating and stimulating military insights. Among the most important were *quan* (weighing up with the lever scales or steelyard), *zhen* (battle formation and display), *bian* (adaptability) and *zhi* (foreknowledge based upon information gathering). These two texts belong to a lineage of military philosophy which, in modern times, has attracted a cult following with their ideas being extended from the battlefield to all other forms of competition, notably diplomacy, the marketplace and the field of play.

Supererogation

Supererogatory actions are usually characterized as 'actions above and beyond the call of duty'. Historically, Catholic thinkers defended the doctrine of supererogation by distinguishing what God commands from what he merely prefers, while Reformation thinkers claimed that all actions willed by God are obligatory. In contemporary philosophy, it is often argued that if morality is to permit us to pursue our own personal interests, it must recognize that many self-sacrificing altruistic acts are supererogatory rather than obligatory. The need for some category of the supererogatory is particularly urgent if moral obligations are thought of as rationally overriding. There are three main contemporary approaches to defining the supererogatory. The first locates the obligatory/supererogatory distinction within positive social morality, holding that the former are actions we are blameworthy for failing to perform, while the latter are actions we may refrain from performing without blame. The second holds that obligatory actions are supported by morally conclusive reasons, while supererogatory actions are not. On this approach the personal sacrifice sometimes involved in acting altruistically counts against it from the moral point of view, making some altruistic actions supererogatory rather than obligatory. The third approach appeals to virtue and vice, holding that obligatory actions are those failure to perform which reveals some defect in the agent's character, while supererogatory actions are those that may be omitted without vice.

1 Historical antecedents

Early Christian writers like Ambrose and Tertullian often distinguished those things that God willed through commandments or precepts, and those things that he willed only through counsels. They held that we are obliged only to obey God's precepts, and that we are permitted to disregard God's counsels if we so choose, although following them is always better than disregarding them. Actions in conformity with the counsels are called 'supererogatory'. The 'Evangelical Counsels', as they were first called, are poverty, chastity, and obedience (Tertullian, *Exhortation to Chastity*, section 3). It was held that in giving permission, for example, to live a life of less than complete chastity, God exercises his will 'in a spirit of indulgence', as a concession to the weakness of human character.

Scholastic thinkers typically offered a rather different account, sometimes side by side with this more traditional one. Aquinas, for example, held that only the conduct required by the precepts is necessary for salvation (see Aquinas, T. §13). Conduct recommended by the counsels is either advice about the most efficient way to gain salvation (*Summa theologiae*), or advice about the way to go beyond what is required for salvation, in order to attain perfection (*Summa contra gentiles*). On Aquinas' teleological view of moral necessity, conformity to the precepts is thus obligatory, or morally necessary, because it is necessary for salvation. Conformity to the counsels is morally optional because it is optional (though perhaps useful) with respect to that same end.

According to Catholic doctrine, God chooses to reward acts of supererogation with the gift of greater merit than the agent requires for salvation. This surplus merit is stored in the 'Treasury of the Saints', owned by the Church, and available to be drawn on by others. This notion of 'congruent merit' or freely-given and transferable reward provided the theological underpinnings for, among other things, the practice of granting indulgences, or the cancelling of another's punishment for some or all of their sins (Heyd 1982: 26).

The Reformers, particularly Luther and Calvin, vehemently criticized the doctrine of supererogation; but much of the criticism that was focused specifically on this doctrine was directed less to the Thomistic position than to the older view formulated by Tertullian (Calvin 1536; see Mellema 1991; Heyd 1982: 26-9).

2 The contemporary argument for supererogation

The Reformation disputations over the coherence and the legitimacy of the notion of supererogation are echoed in contemporary secular debates. It is often argued that if one were always obliged to promote wellbeing, then the demands of morality would be far too strenuous. Our own personal projects would never get off the ground; and even once launched they would constantly be held hostage to the needs of others (Wolf 1982). On the other hand, it is said, if morality recognized a category of supererogatory action and assigned many of the more personally demanding acts of beneficence to this category, then we would have some opportunity to pursue our own interests without moral penalty (see Help and beneficence).

This argument assumes, first, that there are two distinct and competing perspectives: the moral point of view and the self-interested point of view; and that these can recommend conflicting courses of action in the same circumstances (see Egoism and altruism). Second, the argument locates the cause of the conflict in a too-narrow, tripartite conception of the moral realm. This conception recognizes only three categories of action: the forbidden, the required, and the morally indifferent (morally permissible) (Urmson 1958). After all, the reasoning goes, since presumably acts of beneficence are never morally indifferent, on the tripartite conception (unless they are forbidden) they will be obligatory. Hence the conflict with self-interest.

But does the mere prospect of such conflict, however extensive, really require the introduction of some notion of the supererogatory? Why not just accept that such conflicts can occur? Alternatively, why not take the possibility of such widespread conflict with personal concerns to de-legitimize the very conception of the moral on which that possibility turns?

These questions show that our two assumptions do not force the introduction of a category of the supererogatory. However, if we are willing to set aside the option of rejecting our working conception of the moral, we can introduce a third assumption that makes the need for a category of the supererogatory more urgent. This is the assumption that moral reasons are rationally overriding. Suppose that moral reasons always outweigh reasons of self-interest, and that beneficent action is (nearly always) obligatory. It follows that to the extent that beneficence and self-interest are in frequent and fundamental conflict our pursuit of personal projects will be contrary to reason. This conclusion seems entirely unacceptable. To see whether admitting the idea of supererogatory action will avoid this conclusion, however, we must understand how supererogation is to be defined.

3 Supererogation and positive social morality

Assuming that supererogatory action and obligatory action can both be supported by moral reasons, how are we to distinguish them? There are at least three possible approaches. The first is John Stuart Mill’s proposal to restrict the operation of the distinction to the realm of social morality. On this proposal (1861), both supererogatory actions and obligatory actions are actions that maximize utility, and hence actions that one ought to perform. The difference lies only in whether various external and internalized sanctions like blame and guilt are appropriate (useful) given failure to perform. Here Mill echoes Tertullian’s idea that it is God’s willingness to punish failure to perform that distinguishes obligation from supererogation. To avoid the unacceptable conclusion described in the previous section, this approach must hold that to say moral reasons are overriding is only a way of making the point that they are strongly reinforced by negative social sanctions. It will then follow that only obligation-making reasons will be ‘overriding’.

4 Supererogatory acts as morally optional

The second approach focuses attention not on social morality but on the character of the reasons that support beneficent acts. Suppose we accept the following as partial definitions of obligation and supererogation: an act is obligatory only if its omission is morally impermissible; and an act is supererogatory only if its omission is morally permissible. Suppose we further posit that it is morally permissible to act against some set of moral considerations if and only if those considerations are not morally conclusive. We then have a criterion for distinguishing obligatory action from supererogatory action: any action supported by morally conclusive reasons will be obligatory; any action supported by reasons that are less than morally conclusive, will be supererogatory (Dancy 1993).

We can complete this approach by adding an account of overridingness: moral considerations are rationally overriding (if and) only if they are morally conclusive. This approach thus allows for the rational pursuit of self-interest whenever considerations of personal cost (represented within morality) are powerful enough to render the balance of moral reasons inconclusive. Conversely, only when morality regards certain considerations as conclusive must reason do so as well. Hence one is rationally required only to do one’s duty (see Duty §3).

5 Supererogation, virtue, and vice

The third approach accepts the partial definitions of obligatory action and supererogatory action with which the previous approach began. But it proposes that we regard both obligatory action and supererogatory action as supported by morally conclusive reasons. This proposal is backed by the suggestion that considerations about

personal inconvenience are not really full-blown moral considerations, on a par with considerations about human wellbeing, fairness, loyalty, honesty, and so forth. Thus helping others can be 'the moral thing to do', this approach says, regardless of whether it happens to require self-sacrifice.

Here is the puzzle for this third approach: whenever an action is supererogatory, it must be morally permissible to refrain from acting altruistically. But how can it ever be morally permissible to act against morally conclusive reasons?

We might solve this puzzle by making a distinction between first- and second-order moral judgments. Think of first-order judgments as being about agents' actions, while second-order judgments are about the motivation or perhaps the character agents display in their choice of actions. Judgments about the moral conclusiveness of the considerations at stake are first-order judgments. Now in some cases, when the cost to the agent is negligible and the human value at stake is great, to disregard morally conclusive considerations would be to show a degree of callousness, indifference, or smallness of spirit so great that it could only be called a vice (see Virtues and vices §§4-5). This is why refraining from acting in accordance with the first-order reasons is impermissible in this case, and why acting in accordance with those reasons is therefore obligatory.

In other cases, for instance when the cost to the agent is substantial, although to disregard the first-order moral considerations would be to display a less-than-ideal level of motivation, it would hardly be to sink so low as to warrant the imputation of vice. This is why it is permissible to refrain from acting in accordance with the first-order reasons in this case, and why acting in accordance with them is therefore supererogatory (see Trianosky 1986).

Finally, we can add to this third approach a more nuanced account of overridingness. On this account, morally conclusive first-order considerations will be rationally overriding if and only if to disregard them is to display some vice (and hence to do what is morally impermissible). Thus this third approach makes room for the rational pursuit of personal concerns just to the extent that morality is lenient in its judgments about virtue and vice.

6 Supererogation and praiseworthiness

By providing various accounts of overridingness, all three approaches offer some way to interpret the attractive idea that in doing what is supererogatory one acts freely, while in doing what is required, one is bound. It is often thought that this freedom is the ground of the special merit or praiseworthiness that is characteristic of supererogatory action (Heyd 1988).

But are all supererogatory acts necessarily praiseworthy? After all, whichever one of these three approaches one takes, the definition of the supererogatory will remain a purely *deontic* one, on a par with the definitions of the obligatory, the permissible, and the forbidden. This means that an agent can perform supererogatory acts from any one of a variety of motives, some morally admirable and some not. (Even the third approach says nothing about the motives of those who do what is supererogatory. It evaluates only the motives of those who refrain. Compare Brandt's discussion of obligation (1969).) In some ways this consequence seems intuitively plausible, since people can and sometimes do go 'beyond duty' for the most self-serving of reasons.

Even on a deontic analysis of supererogation there remains a certain conceptual link between supererogatory action and praiseworthy motivation: to go beyond duty, not for ulterior, self-interested reasons but for the sake of the moral concerns that are at stake, is necessarily praiseworthy. Here we have a notion of acting from *non*-obligatory moral considerations that is a strict analogue of Kant's notion of acting from duty. In the case of obligation, action from this praiseworthy motivation is what Kant calls 'dutiful' action. In the case of supererogation, it is what Mill (1843) calls 'noble' action. But not all actions in accordance with duty are dutiful; and not all actions beyond duty are noble (Mellema 1991: 3).

Supervenience

Supervenience is used of the relationship between two kinds of properties that things may have. It refers to the way in which one kind of property may only be present in virtue of the presence of some other kind: a thing can only possess a property of the first, supervening kind because it has properties of the underlying kind, but once the underlying kind is fixed, then the properties of the first kind are fixed as well. The supervening features exist only because of the underlying, or 'subjacent' properties, and these are sufficient to determine how the supervening features come out. For example, a person can only be good in virtue of being kind, or generous, or possessing some other personal qualities, and an animal can only be alive in virtue of possessing some kind of advanced physical organization. Equally, a painting can only represent a subject in virtue of the geometrical arrangement of light-reflecting surfaces, and its representational powers supervene on this arrangement. A melody supervenes on a sequence of notes, and the dispositions and powers of a thing may supervene on its physical constitution.

Although the word supervenience first appears in twentieth-century philosophy, the concept had previously appeared in discussion of the 'emergence' of life from underlying physical complexity. The central philosophical problem lies in understanding the relationship between the two levels. We do not want the relationship to be entirely mysterious, as if it is just a metaphysical accident that properties of the upper level arise when things are suitably organized at the lower level. On the other hand, if the relationship becomes too close so that, for instance, it is a logical truth that once the lower-level properties are in place the upper-level ones emerge, the idea that there are two genuinely distinct levels becomes problematic: perhaps the upper-level properties are really nothing but lower-level ones differently described.

If this problem is dealt with, there may still remain difficulties in thinking about the upper-level properties. For example, can they be said to cause things, or explain things, or must these notions be reserved for the lower-level properties? Supposing that only lower-level properties really do any work leads to epiphenomenalism - the idea that the upper-level properties really play no role in determining the course of events. This seems to clash with common-sense belief in the causal powers of various properties that undoubtedly supervene on others, and also leads to a difficult search for some conception of the final, basic or lowest level of fact on which all else supervenes.

1 Varieties of supervenience

The basic instinct behind a supervenience claim is that although we talk in terms of two levels of fact, one of them is fundamental in that once it is fixed then so is the other. It is as if God had only to decide how the basic level is arranged and the other follows on automatically, just as a composer need only decide on the notes and the tempo and then the melody emerges without anything further being done. In this kind of case the relationship is simply one of composition, and there is perhaps nothing mysterious in the way that the melody supervenes upon the notes and tempo, any more than there is anything mysterious in a house supervening on an arrangement of bricks and mortar. But in other cases we are not talking of the supervenience of one thing upon other things, but of one kind of fact upon other kinds of fact, and the relationship seems not to be so simple. In the philosophy of mind, for example, physicalists will certainly want to say that the fact that a creature is alive or conscious supervenes upon complex neurophysiological facts. God needs only to create beings of sufficient neurophysiological complexity and thereby will have created living or conscious beings; no further act of breathing life into the being is necessary.

But it seems only metaphorical to say that life is 'composed' of neurophysiological complexity. The relationship is not simply that of a building to its building blocks. Similarly, one might think that the fact that a computer is running a particular programme supervenes upon microphysical facts about its components, yet it is hard to make sense of the idea that its running the programme is literally composed of some arrangement of hardware. The term 'supervenience' was itself originally applied to the way ethical properties relate to natural ones, and in this case too it is hard to see how a person's virtue can literally be composed out of their natural dispositions, although here it may be more appropriate to think in analogous terms, since at least their virtue may be said to have components, such as charity or honesty. In any event, a general definition is needed.

If the root idea is that once the basic level is fixed, nothing more need be done to fix the upper level, then at least it

should be true that if two things are identical in respect of their basic properties, then they must also be identical in respect of the upper-level properties. The other way round this is not necessarily so, for two things may be identical in the upper-level respect without being identical all the way down. For example, two computers might be running the same programme but with rather different configurations of hardware, or two people may be equally virtuous but because of somewhat different characters. This is frequently referred to as the 'variable realization' of the upper-level properties, and is compatible with their supervenience on the lower level. Returning to the root idea, we can now frame it as an impossibility claim:

(S) It is not possible that two things should be identical in respect of their lower-level properties without also being identical in respect of their upper-level properties.

Various questions arise. First, and most obviously, any such claim only makes sense given a background distinction between the two levels of property. If we cannot genuinely separate the basic or subjacent (sometimes called subvenient) level from the upper or supervening level, then no such claim can be formulated. And in interesting cases, such as the supervenience of the ethical on the natural, there will be philosophers who deny that such a separation can be achieved, seeing it as dependent on a doubtful fact-value distinction.

Similarly, there may be disputes about priority: some philosophers may hold that the semantic elements of a language supervene upon the intentions with which its speakers use its elements; others hold that the content of peoples' intentions supervene upon the semantics of the language in which they would be disposed to express them (this kind of dispute also generates the battle between methodological individualism and various kinds of holism). There may also be disputes about the extent of the basic class. Thus, to some philosophers it is important that the present content of someone's sayings should supervene only on their present brain states; to others it is important that it supervene upon the nature of the historically extended entire social and physical environment in which they live.

A second range of problems arises because we might worry about the strength of impossibility in any particular case. Is it a matter of logical impossibility, or metaphysical impossibility, or is it simply a question of the laws of nature? One might need to advance claims in different strengths, such as:

(E) It is not possible, as a conceptual matter, that two things should be identical in respect of their natural properties without being identical in respect of their ethical properties.
(M) It is not possible, as a metaphysical matter, that two things should be identical in respect of their physical properties without being identical in respect of their mental properties.
(P) It is not possible, given the laws of physics as they are, that two things should be identical in respect of their microphysical properties without being identical in respect of their macro-physical properties (such as weight or tensile strength).

Such formulations probably do not exhaust the intended significance of supervenience claims. For example, they do not capture the asymmetrical dependency, whereby the upper arises 'in virtue of' the lower (after all, denying variable realization, someone might think it impossible that two things should be identical mentally without being identical physically, but this would not mean that the physical supervenes on the mental). Nevertheless, they form the essential core.

The third kind of claim is perhaps the easiest to understand: it only demands that the laws of physics, as they actually obtain, connect the two levels in such a way that identity in one respect delivers identity in the other. In different possible worlds obeying different physical laws, the connection may be severed, with the weight or tensile strength of objects depending on other factors also (in fact weight, in our world, actually depends on other factors, such as the distribution of matter around the universe). The only problem with this kind of supervenience claim is that it inherits the difficulties surrounding the concept of a law of nature.

A claim such as (M) raises the stakes. Here we want to say that there is a more intimate connection between the physical and the mental. It is not just in the world as we have it that mental properties emerge out of physical properties. Rather, in any world we can properly describe, the mental must emerge out of the physical. There is simply no metaphysical possibility of a 'ghost stuff' or separate source or underlying basis of mentality. It has to occur in creatures of particular kinds of physical complexity. It offends against metaphysics, not just physics as we

have it, to postulate two physically identical creatures, one of whom is conscious, the other a zombie. Anybody denying this would be thinking in terms of a dualism of some metaphysically improper stamp. Notice that although many philosophers will subscribe to this thought, it is not altogether easy to formulate it. One distinction frequently made is between 'strong' supervenience, whereby the claim applies to any two things in any possible worlds, and 'weak' supervenience, whereby it only governs things within the same world. The difference is that across worlds we might imagine different laws of nature, and perhaps different constituent elements of nature, whereas one world must be governed by one set of laws and contain only whatever elements it has.

Finally according to (E) anyone denying the supervenience is in conceptual error, betraying some kind of incompetence with the concepts involved. This goes further than (M), unless we think that metaphysics is no more than a display of what is implicit in the concepts with which we think. It is, at least, clear that someone disposed to value two things differently, although admitting that they are identical in every other respect, is somehow confused or out of line, or ignoring the entire purpose of the notion of valuing a thing, compared with someone who denies (M), perhaps because of lingering Cartesian dualism (see Dualism).

2 The promises and problems of supervenience

Once a supervenience claim is properly formulated and its strength suitably identified, it offers the seductive promise of a path between full-scale reduction of upper-level to lower-level properties, and an uncomfortable dualism. Full-scale reduction is here the attempt to show that there is really nothing but the underlying level, and that talk in upper-level terms merely makes disguised reference to this one kind of reality. It is prompted by metaphysical unease but it is expensive, since it usually turns out that the requisite reductions distort what we mean or what we are referring to. For example, it is highly unnatural to say that when we describe a computer by saying which programme it is running we either mean anything about its electronics or are referring to its engineering configuration. We are doing something different altogether, yet we ought to be able to make software descriptions metaphysically innocuous even if we think that all that is fundamentally going on is captured by the full story about the machine's hardware. Allowing that the software characterization supervenes on the hardware may fulfil this promise. Supervenience promises the relief from metaphysical anxiety, but without the costs of reduction.

To fulfil this promise it is clear that we must understand why the impossibilities in question arise. Without such an understanding, the upper-level properties may still seem to be unexplained 'danglers' or unexplained arrivals on the scene (reduction at least promises this explanation, by collapsing the two levels into one). This in turn may be a useful constraint on philosophies of various areas: for example, understanding why (E) is true may be easier on some accounts of ethical commitment than others. But without such extra commentary, and in particular in the philosophy of mind and the philosophy of language, supervenience claims may easily be part of the problem rather than part of the solution (see Reductionism in the philosophy of mind).

Supervenience of the mental

Phenomena of one kind 'supervene on' phenomena of another kind just in case differences with respect to the first kind require differences with respect to the second. G.E. Moore claimed that beauty supervenes on non-aesthetic properties: if one painting is beautiful and another is not, there must be some relevant non-aesthetic difference between them. Supervenience seems to offer the possibility that a property may depend on other properties, without being explicable in terms of them. Contemporary philosophers of mind have employed the idea to capture the relation that appears to obtain between mental and physical properties.

Various supervenience relations have figured in recent discussions in philosophy of mind, of which the most important is 'strong property' supervenience characterized as follows:

Q strongly supervenes on $\{P_1, P_2, ...\}$ if and only if any individuals *x* and *y*, in any nomologically possible worlds, that differ with respect to *Q* also differ with respect to some of the *P*s.

Thus, beauty supervenes on physical properties if and only if any two things in any two nomologically possible worlds (worlds compatible with the laws of physics) that differ in their beauty also differ physically.

Supervenience has been claimed to capture two ideas. One is that individuals that agree on all their *P* properties also agree with respect to *Q*. The other is that the possession of *Q depends* on the possession of *P* properties. Besides capturing the relation that plausibly obtains between evaluative and non-evaluative properties (see Supervenience), it has recently seemed apt for capturing views about the relations between the mental and the non-mental.

One important doctrine concerning the relationship between mental and physical properties that has been formulated in terms of supervenience is 'externalism'. This is the *denial* of the claim that intentional mental properties (for example, the property of thinking that water is wet) strongly supervene on neurophysiological properties: two people may be exactly alike with respect to their neurophysiological properties, but differ with respect to their intentional ones. This is not surprising in the case of certain, obviously *relational* intentional properties, such as *knowing* that France has no king: two people could be neurophysiological duplicates, but one might live in a world in which France had no king, but another in a world in which it did. Since knowledge entails the truth of what is known, the first person would, but the second would not *know* that France had no king.

More controversially, Hilary Putnam argued for externalism by proposing a thought experiment in which two individuals are exactly alike neurophysiologically but live in different environments, the first in one like ours containing *water*, that is, H_2O, and the other in one containing a superficially similar but *different* substance, XYZ. He concluded that in this scenario the two individuals would be *thinking about* different substances when they assert 'water is wet' (see Content: wide and narrow; Methodological individualism).

Supervenience figures in a more positive way in formulating another important doctrine in contemporary philosophy of mind, 'non-reductive physicalism'. Many philosophers (for example, Davidson 1980) think there are good reasons for supposing that mental properties, such as thinking about water, could not be *identified* or 'reduced to' (for example, defined in terms of) any physical properties, but that, nevertheless, the exemplifications of the mental properties depend on the exemplifications of physical ones. For example, although the property of thinking about water may not be reducible to physical properties, the occurrence of thoughts about water depend on the occurrence of physical events and states (see Anomalous monism; Property theory; Reductionism in the philosophy of mind). (Note that non-reductive physicalism is compatible with externalism since the properties on which intentional mental properties are said to depend - the 'supervenience base' - may include properties other than neurophysiological ones, for example, actual causal interactions with H_2O.)

This strong supervenience of mental properties on physical properties does not entail that mental properties are physical properties, or even that the instantiation of physical properties can provide an illuminating *explanation* of the instantiation of mental ones. Thus, supervenience appears not to entail the reducibility of the mental to the physical (see Reductionism in the philosophy of mind). But it is unclear whether it actually captures the physicalist idea that mental properties *depend* on physical ones. As formulated above, supervenience is compatible with there

being irreducible laws that link mental with physical properties; if so, then there might be different irreducible mental-physical laws in worlds that were otherwise physically identical. One can get closer to the spirit of physicalism by requiring in the above definition that all the laws involved in characterizing nomologically possible worlds include *only* physical laws.

Two significant philosophical questions about supervenience arise. (1) Why should we believe that mental properties supervene on physical properties? (2) What, if anything, explains why mental properties supervene on physical properties? Loewer (1994) suggests that supervenience follows from two reasonable assumptions: that mental properties are causally connected with physical properties, and that physics is causally closed and complete. The latter means that every physical change, if it can be explained at all, can be explained in terms of prior physical events. If mental properties failed to supervene on physical properties then there could be two nomologically possible worlds exactly alike physically, but in one, mental property *M* is instantiated while in the other, *M* is not instantiated. Since physical events in these worlds are fully accounted for by prior events the presence/absence of *M* is, contrary to our assumption, causally irrelevant (see Mental causation).

Although the preceding argument may provide reason to believe that the mental supervenes on the physical, it does not provide any explanation of the supervenience relation itself. Without such an explanation, supervenience may seem to be a mysterious brute fact. The explanations that have been suggested are that mental properties are identical to physical properties, or that they are functional properties that are realized by physical properties (see Functionalism; Mind, identity theory of). While these accounts do explain supervenience, they may be stronger than some advocates of non-reductive physicalism have in mind when they claim that mental properties cannot be reduced to or explained in terms of physical properties. These philosophers may have to accept supervenience as unexplained.

Suso, Henry (*c.*1295-1366)

Suso was a Dominican friar and mystic and, with his friend John Tauler, a student of Master Eckhart. The three form the nucleus of the Rhineland school of mysticism. As a lyric poet and troubadour of divine wisdom, Suso explored with psychological intensity the spiritual truths of Eckhart's mystical philosophy. His devotional works were extremely popular in the later Middle Ages.

A native of Swabia, centre of the *Minnesang* and chivalry, Suso became a Dominican novice at thirteen and experienced a radical conversion at eighteen. There followed a decade of intense contemplation, accompanied by severe asceticism and self-torture. During his theological studies at Cologne (1324-8), a centre for Christian Neoplatonism since Albert the Great, he met John Tauler and may have studied under Meister Eckhart. Returning to Constance, he served as lector, then prior at the friary school until 1348, after which he lived in Ulm until his death in 1366. These last decades involved preaching and pastoral care in Dominican convents and in the Beghard and Beguine communities.

Suso's disciple Elsbeth Stagel, a nun at Töss, compiled anecdotes from his life which became the nucleus for *Das Buch von dem Diener (The Life of the Servant)* (1362), the first autobiography in German literature. Suso presents himself as a spiritual knight in pursuit of divine Wisdom. Parts of the *Life* echo Eckhartian themes, but its focus on love and interior experience places this and his other works squarely in the Augustinian tradition of spirituality of the sort found in the writings of Bernard of Clairvaux. Traditional aspects of monastic spirituality, like intense prayer and penance, are blended with features more typical of fourteenth-century hagiography such as raptures, visions and a general emphasis on personal experiences.

His first work, *Das Büchlein der Wahrheit (The Little Book of Truth)* (1328), is an introduction to Eckhart's speculative mysticism and scholastic theology in the form of a dialogue between the disciple (Suso) and Eternal Truth. This didactic use of dialogue as a literary device, the first in German literature, recalls Boethius' *De consolatione philosophiae*. Suso defends Eckhart's views, particularly concerning the absorption of the soul into God, against charges of heresy and explores the spiritual ideal of detachment (*Gelassenheit*). The goal of the spiritual life is to lose oneself in God, but Suso differs from Eckhart in holding that mystical union preserves the distinction between Creator and creature. Moreover, Suso adapts key aspects of Eckhart's Neoplatonic mystical theology to his more devotional spirituality. All things are nothing before the transcendence of the divine being. The effective means to attain God is to transcend all thought and self-will. God as the divine ground of being (*Grund*) is pure simplicity, an 'interior fortress'. Human nature is 'poured out' and God pours in, culminating in the 'breakthrough' (*Durchbruch*) to the divine ground through the Son. Suso connects the soul to God through Eckhart's likening the nothingness of creatures to the abyss of the divine ground, that is, the Godhead beyond God. The remarkable fifth chapter speaks of Suso's own mystical raptures and ecstasies, while the seventh and final chapter explores *Gelassenheit*, the detachment and resignation necessary to attain the highest spiritual state.

His second work, *Das Büchlein der ewigen Weisheit (The Little Book of Eternal Wisdom)* (1327-34), abandons theological speculation completely. In its expanded Latin version, the *Horologium sapientiae (Clock of Wisdom)*, it became the most popular devotional book in the late Middle Ages. This lyrical dialogue, which owes a great deal to the Song of Songs, embodies practical devotion in the form of meditations on the Passion of Christ and on the spiritual value of suffering. The uniqueness of the work derives from its combination of chivalrous imagery with mystical symbolism. The Wisdom pursued by the spiritual knight is also the incomprehensible Good which is utterly inexpressible in language: all creatures 'are swept away into the Good, from whom they emanated'.

Das Briefbüchlein (The Little Book of Letters) (1362), condensed from the larger *Das grosse Briefbuch (The Great Book of Letters)* (*c.*1360), is a devotional manual in the form of pastoral epistles, similar in tone to Seneca's *Moral Epistles* (see Seneca). Suso's poetic gifts transform natural images into spiritual allegories. Suso acts as spiritual guide, offering practical advice to his disciples amid life's tribulations. Here and throughout his writings Suso's psychological insight and poetic subtlety aim at furthering progress on the spiritual path to the ultimate goal.

Suárez, Francisco (1548-1617)

Francisco Suárez was the main channel through which medieval philosophy flowed into the modern world. He was educated first in law and, after his entry into the Jesuits, in philosophy and theology. He wrote on all three subjects. His philosophical writing was principally in the areas of metaphysics, psychology and philosophy of law, but in both his philosophical and theological works he treated many related epistemological, cosmological and ethical issues. While his basic outlook is that of a very independent Thomist, his metaphysics follows along a line earlier drawn by Avicenna (980-1037) and Duns Scotus (1266-1308) to treat as its subject 'being in so far as it is real being'. By the addition of the word 'real' to Aristotle's formula, Suárez emphasized Aristotle's division of being into categorial being and 'being as true', as well as Aristotle's exclusion of the latter from the object of metaphysics. Divided into a general part dealing with the concept of being as such, its properties and causes, and a second part which considers particular beings (God and creatures) in addition to the categories of being, Suárez's metaphysics ends with a notable treatment of mind-dependent beings, or 'beings of reason'. These last encompass negations, privations and relations of reason, but Suárez's treatment centres on those negations which are 'impossible' or self-contradictory. Inasmuch as such beings of reason cannot exist outside the mind, they are excluded from the object of metaphysics and relegated to the status of 'being as true'. In philosophy of law he was a proponent of natural law and of a theory of government in which power comes from God through the people. He was important for the early development of modern international law and the doctrine of just war. While his brand of Thomism was opposed in his own time and after by some scholastics, especially Dominicans, he had great authority among his fellow Jesuits, as well as other Catholic and Protestant authors. Outside scholasticism, he has influenced a variety of modern thinkers.

1 Life and works

Francisco Suárez was born at Granada in Spain. After preparatory studies, in 1561 he enrolled at the University of Salamanca, where he studied law until on 16 June 1564 he entered the Society of Jesus (the Jesuits). Three months later he began the study of philosophy. In October 1566, still at Salamanca, he went on to theological studies. Chief among his mentors in these was the Dominican, Juan Mancio (1497-1576), himself a successor of Francisco de Vitoria (*c.*1486-1546) in Salamanca's principal chair of theology.

Following his theological studies, Suárez began to teach philosophy in 1570, initially at Salamanca and then at Segovia. Ordained a priest in 1572, he continued to lecture in philosophy until, in 1574, at the Jesuit College, Valladolid, he began his main life's work as a theology teacher. Later he taught theology at Avila (1575), Segovia (1575), Valladolid again (1576), Rome (1580), Alcalá (1585) and Salamanca (1593). In 1597, he assumed the principal chair of theology at the University of Coimbra, in which he remained until his retirement in 1615.

Besides teaching, Suárez took part in theological and political disputes. The most famous of these was the debate *De auxiliis* (On the Helps [for Salvation]), between sixteenth-century Jesuits and Dominicans. The controversy concerned God's foreknowledge and causality, grace and human freedom. In this debate Suárez, along with fellow Jesuits, Robert Bellarmine (1542-1621) and Luis de Molina (1535-1600), allowed for divine prerogatives but championed human free will. On the core question of conditional future contingents (*futuribilia*), Suárez adopts Molina's doctrine of a 'middle knowledge' that falls between God's knowledge of merely possible things and God's knowledge of things other than himself that are, were, or will be actual. However, he modifies Molina's view that God knows all things other than himself by a 'super-comprehension' of them in his own essence, substituting for this a view that God knows these things immediately in themselves as they exist in a purely intentional or objective way. More political was a quarrel between the republic of Venice and the papacy about the limits of papal jurisdiction. In defence of the papal position, Suárez in 1607 composed a treatise, *De immunitate ecclesiastica a Venetis violata (On the Ecclesiastical Immunity Violated by the Venetians)*. Commending his effort, Pope Paul V stated that the work revealed its author to be 'an eminent and pious theologian'. From this came the honorific title with which Suárez passed into history - *Doctor eximius ac pius* (Eminent and Pious Teacher).

The majority of Suárez's writings are theological, often corresponding to specific parts of the *Summa theologiae* of Thomas Aquinas (§6), but there is also the extremely influential *De legibus seu de Deo legislatore (On Laws or on God the Legislator)*, the fruit of Suárez's teaching between 1601 and 1603, published at Coimbra in 1612. Outside

the Thomistic framework are the work on ecclesiastical immunity mentioned above and, at Coimbra in 1613, the *Defensio fidei catholicae adversus anglicanae sectae errores, cum responsione ad apologiam pro juramento fidelitatis et praefationem monitoriam serenissimi Jacobi Angliae Regis (Defence of the Catholic Faith against the Errors of the Anglican Sect, with a Reply to the 'Apology' for the 'Oath of Fidelity' and the 'Warning Preface' of James, the Most Serene King of England)*. Upon its publication, this work, which details Suárez's political philosophy, was condemned by James I and publicly burned in London, because in it Suárez had opposed the absolute right of kings and defended the indirect power of the papacy over temporal rulers, as well as the right of the citizens to resist a tyrannical monarch. Suárez even defended tyrannicide in the case of a monarch deposed for heresy by the pope.

2 Metaphysics

Also outside the Thomistic framework are the two volumes of Suárez's most important work, the *Disputationes metaphysicae (Metaphysical Disputations)*, which first appeared at Salamanca in 1597. A résumé of his own and previous thought on myriad questions, it is arranged in the form of fifty-four 'Disputations' dealing systematically with metaphysics. In this format, Suárez's volumes mark a radical departure from previous metaphysical treatises, which usually had been either short works, such as Aquinas' *De ente et essentia (On Being and Essence)*, or commentaries on the text of Aristotle.

The *Disputationes metaphysicae* is a feat of learning. After stating each problem, Suárez has searched the history of philosophy and theology for solutions offered to it. Every conceivable Greek, Arabic, patristic and especially scholastic writer seems to have been cited at least once. As many as twenty-two opinions have been cited in connection with a single question. The historian J. Iturrioz (see Martín, Ceñal, Hellin *et al.* 1948) has compiled a list of 7,709 of these citations, which refer to 245 different authors. Of these, Aristotle was mentioned most often (a total of 1,735 times), and Aquinas the next most (cited 1,008 times). No mere compiler of opinions, Suárez was an independent thinker who, as he reported positions and gave due regard even to those he opposed, was intent on presenting his own metaphysics.

The disputations begin with Suárez telling us that the object of metaphysics is 'being in so far as it is real being' (*Disputationes metaphysicae* 1). To explain this, he employs two distinctions, already familiar among scholastic authors. The first of these is between the 'formal concept' as an act of the mind, and the 'objective concept' as what that act immediately intends as its object. This latter may be some individual thing or some common or universal character (*ratio*). Again, it may be something actual, possible or merely objective. The second distinction falls between 'being (*ens*) taken as a participle' (which refers to an actual existent), rather than 'being taken as a noun' (which refers to whatever is not a mere fiction but is true in itself and apt really to exist). The object of metaphysics is then more exactly identified with the 'common objective concept of being as a noun' (*Disputationes* 2). This object, which reflects Avicenna's interpretation of Aristotle's *Metaphysics*, prescinds from existence and, precisely as common, transcends all genera, species and differences to encompass everything real, from extrinsic denominations (such as 'being right', 'being left', 'being known' or 'being willed'), through mere possibles (which at their core reduce to non-contradiction), to actual created substances and accidents, to the subsistent, purely actual and necessary reality of God. Over the range of such beings, the common concept of being is analogous with 'an analogy of intrinsic attribution'. In this analogy, a unified concept is shared in an ordered way by different beings (God and creatures, substance and accidents) inasmuch as the being of what is posterior depends upon the being of what is prior (see Language, Renaissance philosophy of §4).

After a general treatment (*Disputationes* 3) of the transcendental properties of every being as it is a being - namely, unity, truth and goodness - questions are raised under unity about individuation, universal natures, and various kinds of distinction (*Disputationes* 5-7). Rejecting the Aristotelian and Thomistic account of individuation in terms of 'quantified matter', as well as Scotistic 'thisness', Suárez comes close to nominalism and says that every thing is individual by its very entity. On universals, he again leans towards nominalism and denies any real common nature independent of individuals, yet he insists that the universalizing activity of the mind has a foundation in the likenesses of things. Restricting distinctions to real, rational and modal, he rejects the formal distinction, which Duns Scotus asserted to be present between 'formalities' prior to any operation of the intellect. In following disputations, discussion of truth, which centres on the conformity of formal with objective concepts, is balanced by discussion of falsity (*Disputationes* 8-9); and discussion of goodness is balanced by that of evil, which in standard

scholastic fashion is regarded as a privation of good (*Disputationes* 10-1). The twelfth disputation generally treats causes, while 13-25 deal specifically with material, formal, efficient and final causes. Concluding this first part is a consideration of causes in comparison with their effects and in relation one to another (*Disputationes* 26-7).

The second part opens with the main division and principal analogy of being between infinite and finite (*Disputationes* 28). The existence of God is then causally demonstrated in an expressly metaphysical way which, again reflecting Avicenna, employs the principle, 'Everything which comes to be, comes to be by another' (*Disputationes* 29) and follows the analogous common concept of being from lesser and lower being to a First Being. In the same disputation, Suárez rejects any physical demonstration, like that of Aristotle, adopted by Averroes and Aquinas, which would employ the principle, 'Everything which is moved is moved by another', to pass from motion to a First Mover. Suárez goes on to investigate the perfection, simplicity, immensity, immutability, wisdom and omnipotence of God (*Disputationes* 30). Disputation 31 begins treatment of finite being with a denial of the Thomistic distinction in creatures between essence and existence, which Suárez understands as falling between two 'things' (*res*). Rejecting Scotistic formal or modal distinctions, Suárez says that the only distinction here is one of reason with a foundation in reality. Disputation 32 considers substance and accidents in general, plus the analogy of being between created substances and accidents. Substance is treated in detail through the next four disputations while the different categories of accident are the subject matter of Disputations 37-53. Of particular interest is Disputation 47, where Suárez treats real relations, which divide into transcendental and predicamental. Transcendental relations - such as those between matter and form, accidents and substance, creatures and God - transcend the lines of categories, whereas predicamental relations are restricted to the accidental category of relation. Every such relation (for example, one of likeness) involves a real subject (one person), a real terminus (another person), and a real foundation (brown hair), but Suárez maintains in nominalist fashion that a predicamental relation is ultimately identical with its foundation, as this exists in both the subject and the terminus. The work concludes with a discussion of 'beings of reason', which divide into negations (including impossible objects), privations and reason-dependent relations - all of which fall outside real being, the object of metaphysics (*Disputationes* 54).

3 Philosophical psychology

While Suárez treated topics like abstraction, universal knowledge and personhood also within metaphysics, he regarded philosophical psychology as properly a part of physics (that is, the Aristotelian philosophy of nature). His work *De anima (On the Soul)*, which he was revising at the time of his death and which was again a systematic presentation rather than itself a commentary, returned to the medieval tradition of commentary on Aristotle's *On the Soul*. Divided into six books, it dealt successively with the nature, attributes, faculties, operations and ultimate status of the rational soul, which in the human composite is related to the body as form to matter.

The only substantial form of a human being, the rational soul is principle for a variety of vegetative, sensitive and intellectual activities (*De anima* I). The distinction among such activities indicates specifically distinct powers (vegetative, sensitive and intellectual) from which they immediately stem, as well as a real distinction between such powers and the soul itself (II c.1-2). Differing from the whole scholastic tradition, Suárez unites the common sense, imagination, memory and estimative sense in one internal sense power (III c.30). At the intellectual level, he distinguishes between the adequate object of the intellect as such (that is, being as being, which embraces all intelligible items), and the object proportionate to the human intellect in its present state (that is, sensible or material things). He also allows for a direct and immediate knowledge of the singular (IV c.1-2). The excellence of its intellectual operations indicates the intrinsic spirituality and the transcendence of the soul over the body (I c.9).

For the immortality of the soul, Suárez offers two main arguments (*De anima* I c.10). First, inasmuch as the human intellective power is incorporeal and spiritual it is also substantially simple. Therefore, of its nature it is incorruptible and thus immortal. Second, under the justice of God evil persons should be punished and good persons rewarded. However, that often does not happen in this life. Therefore, there must be another life in which it can happen and this can only be if the soul is immortal.

Both in this life and in any afterlife the soul alone without the body would be less than a full human being. To designate it as such, Suárez accepts the bold word of Cajetan (§§3-4): the soul by itself is a 'semi-person' (*De anima* VI c.1). This incomplete character of the soul alone may suggest a philosophical suasion for the resurrection of the body (VI c.9) (see Aristotelianism, Renaissance §§4-5).

4 Philosophy of law and society

For Suárez all law stems from the 'eternal law', which is 'a free decree of the will of God establishing the order to be observed either generally by all parts of the universe in relation to the common good… or especially to be observed by intellectual creatures in their free operations' (*De legibus* II c.3). In so emphasizing God's will, Suárez has distinguished himself from Aquinas who identified the eternal law with divine reason as it governs the created universe.

Immediately derived from the eternal law is the natural law which resides in human minds and enables human beings to discern moral good and evil (see Natural law). Suárez (*De legibus* II c.7) tells us that natural law first embraces general moral principles like: 'Good must be done and evil avoided' and 'Do not do to anyone else what you would not want done to you'. Next come principles more particular but still evident from their terms, such as: 'Justice should be observed', 'God should be worshipped', 'One should live with self-control', and so on. From these principles come conclusions more or less easily and broadly known, for example, that such things as adultery and theft are wrong. Requiring more reasoning and not easily known to all are conclusions like: fornication is intrinsically evil, usury is unjust, or lying is never justified.

While it may be affected extrinsically because of changed circumstances, no true principle of natural law can be diminished or dispensed from by any human law or power (*De legibus* II c.14 n.5). Rejecting both the opinion of William of Ockham, that God can dispense from the entire Decalogue and could indeed abrogate the whole natural law, and the opinion of Duns Scotus, that God can dispense from the precepts in the second table of the Decalogue (which regard human beings or other creatures), Suárez maintains that the whole Decalogue is indispensible even by the absolute power of God (c.15 n.16). Thus, even though it is rooted in the divine will, law is not arbitrary either for men or for God.

Close on natural law, the 'law of nations' (*jus gentium*) has the general character of positive law but differs from the civil law of particular states. Unwritten, it has been established not by a single state but by the customs of almost all nations (*De legibus* II c.19 n.7). It thus originates in human consensus and it can in principle, though not with ease, be changed.

In one sense, the *jus gentium* is 'the law of nations among themselves (*inter se*)' - a law which different nations are obliged to observe *vis-à-vis* one another. Such items as the immunity of ambassadors and free commerce, as well as the 'right of war' (*jus belli*), belong to the *jus gentium* understood in this way. In a second way, it is 'the law of nations within themselves (*intra se*).' This is the law which individual states commonly observe within their own borders. Items such as the division of goods or possessions, private property, buying and selling, and the use of money, belong to the *jus gentium* taken in this second way. The first way, which is effectively an international law, is most properly called 'the law of nations' (*De legibus* II c.19 n.10).

Like other Catholic thinkers of his day, Suárez did not regard war as intrinsically evil (see War and peace, philosophy of §2). Although it was deplorable and should be avoided wherever possible, at times war was the only option open for the preservation of the republic, which has a right and even an obligation to defend itself (*De legibus* II c.18 n.5). That any war be 'just', proper authority (legitimate, public and supreme) was required to declare it. Again, a just cause of sufficient gravity was needed. Furthermore, right conduct should be the rule at the beginning of the war, in its prosecution and in victory afterwards. As regards authority to declare and wage it, war may be based upon one state's right to punish or avenge an injury done to it by another. Each state, 'supreme in its own order' - that is, the temporal order - with no tribunal beyond, has the authority forcibly to redress injuries against itself (c.19 n.8).

Because civil power as such is not greater in Christian than in pagan princes, Christians can have no more reason than pagans for a just war. Neither can Christians make war against pagans solely because these lack faith. By Suárez's time, questions raised by the evangelization of the Native Americans were largely settled for Catholic thinkers. From Vitoria on, it was commonly held that they were human beings, masters of their own lives and possessions, and that it was not lawful without just cause to subjugate and despoil them - even in order to Christianize them. This was also Suárez's position, which he took, however, on an abstract level, almost without mention of the Native Americans. Against a possible application to them of Aristotle's division of human beings into those fitted by nature to rule and those who were by nature 'slaves' (*Politics* 1.5.1254a18-1255a2), Suárez's

view was simple and direct. It is incredible to say that all the people in any region or province have been born 'monstrous and in a way that contradicts the natural disposition' of human beings to be free (*De justitia* q.6). In fact, all persons, as made in the image of God, are equally capable of dominion over themselves and their possessions (*Defence of the Catholic Faith* III c.1).

At its origin, the state is natural; but it is also voluntary (see State, the). Free persons, naturally inclined to political association, must still agree to it. Hence, the state itself arises out of a contract, or 'a consensus', explicit or tacit, freely entered into by the community (*De legibus* III c.3). People are not forced by nature to choose any particular form of state and in fact different forms exist, with a natural equality among them all. In practice, the best kind of government is some form of monarchy (c.4). But what form a monarchy takes and how much power any monarch has will depend upon the terms of the initial grant of the people (*Defensio fidei catholicae* III c.2). Thus, civil authority or power, in any form, is ultimately from nature, and the God of nature, but immediately from the people.

Even though each state is 'supreme in its own order', the power and laws of one end where those of another begin. Again, while the state has power to enact laws from which there is no appeal to any other earthly tribunal, the power of any state, even within its own territory, is not absolute. Though ordinarily their gift of power is irrevocable, in principle the people retain authority over their government. Accordingly, as the common good demands, political power, even that of a monarch, may in different circumstances be changed or limited (*Defensio fidei catholicae* III c.3).

Other restrictions on state power occur inasmuch as it stops short at the private zone of families and individuals. For these are by nature prior to the state. In addition, human beings are not just citizens of this world. And while he admits a legitimate concern by the republic for its members' morality, Suárez tells us that, even at a natural level, each person aims at a final happiness which transcends the reach of civil law and power (*De legibus* III c.11).

While temporal power is ultimately from God, immediately its origin is natural and human; in contrast, ecclesiastical power is directly of divine origin, 'from the special promise and grant of Christ' (*Defensio fidei catholicae* III c.6 n.17). Although church and state are each 'supreme in [their] own order', the basic relation between the two is hierarchical, comparable to that between the soul and the body (*De legibus* IV c.9 n.3). The power of the many states of this world is directly and exclusively within the temporal order, aiming at a common temporal good of 'political happiness' (I c.13). The power of the one Christian church, pointed towards the eternal salvation of its members, is directly within the spiritual order. Indirectly, however, that church has power over a Christian state even in temporal matters (III c.6). Conversely, civil power, at least in Christian states, is indirectly dependent upon and should be at the service of the higher goal of the church (*Defensio fidei catholicae* III c.5). Suárez acknowledged in this a certain inequality between Christian and infidel princes, but he counts it a plus for Christian states and sovereigns that their power is raised to a new height in its subordination to the church (c.30) (see Political philosophy, history of §8).

5 Influence

Suárez exercised wide and deep influence on post-Renaissance Catholic scholasticism. Also, largely through the growth and agency of the Jesuit Order, Suarezian metaphysics spread from the Catholic schools of Iberia to various northern European locales. It penetrated the Lutheran universities of Germany where the *Disputationes metaphysicae* (of which seventeen editions appeared between 1597 and 1636) was pondered especially by those who preferred Melanchthon's attitude towards philosophy to Luther's. Indeed, in a number of seventeenth-century Lutheran universities it served as a textbook in philosophy. In much the same way, Suárez had major influence in the Reformed tradition of German and Dutch schools for both metaphysics and law, including international law. To sense Suárez's importance here for the provenance of modern international law, it is enough to recall that, for the famous Dutch jurisprudent, Hugo Grotius, the Jesuit doctor was a philosopher and theologian of such penetration 'that he hardly had an equal' (*Epistola* CLIV; quoted in Scorraille 1912-3, vol. 2: 437).

As Martin Heidegger later saw it, Suárez was the main source through which Greek ontology passed from the Middle Ages to usher in the metaphysics and the transcendental philosophy of modern times. Most likely, Suarezian metaphysics was that first learned by Descartes from his Jesuit teachers at La Flèche. On at least one occasion he refers to the *Disputationes*, of which he is believed to have owned a copy. Leibniz boasted that while

yet a youth he had read Suárez 'like a novel'. Schopenhauer, in his chief work, *Die Welt als Wille und Vorstellung (The World as Will and Representation)*, displays much acquaintance with the *Disputationes*, which he values as 'an authentic compendium of the whole scholastic tradition' (quoted in Grabmann 1926: 535). Similarly, Franz Brentano, in his 1862 work on the manifold meaning of being according to Aristotle (*Von der mannigfachen Bedeutung des Seienden nach Aristoteles*), has recommended the *Disputationes metaphysicae* to anyone who wants to learn of the diversity of medieval views on Aristotle. But perhaps most strikingly, for Christian von Wolff (whose *Ontologia* Immanuel Kant thought practically coterminous with pre-critical metaphysics) it was 'Francisco Suárez, of the Society of Jesus, who among scholastics pondered metaphysical questions with particular penetration' (*Philosophia prima sive ontologia* I.2.3 n.169; quoted in Gilson 1952: 117).

List of works

Suárez, F. (1590-1617) *Opera omnia (Complete Works)*, Paris: Louis Vivès, 1856-66, 26 vols; two supplementary volumes of indices, 1878.(This is the latest and most accessible edition of Suárez's complete works.)

Suárez, F. (1584) *De justitia et jure (On Justice and Law)*, ed. J. Giers, in *Die Gerechtigkeitslehre des jungen Suárez: Edition und Untersuchung seiner Römischen Vorlesungen 'De Iustitia et Iure'*, Freiburg im Breisgau, 1958.(Suárez's early lectures at Rome on justice and law; cited in §4.)

Suárez, F. (1597a) *Disputationes metaphysicae (Metaphysical Disputations)*, in F. Suárez, *Opera omnia*, vols 25-6, Paris: Louis Vivès, 1856-66; repr. Hildesheim: Olms, 1965.(Suárez's systematic presentation of metaphysics.)

Suárez, F. (1597b) *Disputatio V: Individual Unity and its Principle*, trans. J.J.E. Gracia, in *Suárez on Individuation*, Milwaukee, WI: Marquette University Press, 1982.(In addition to its own intrinsic worth, this disputation is important for its possible influence on the young Leibniz.)

Suárez, F. (1597c) *On Formal and Universal Unity (Disputatio VI)*, trans. J.F. Ross, Milwaukee, WI: Marquette University Press, 1964.(This disputation contains Suárez's teaching on the problem of the universals which situates him between medieval nominalism and realism.)

Suárez, F. (1597d) *On the Various Kinds of Distinctions (Disputatio VII)*, trans. C. Vollert, Milwaukee, WI: Marquette University Press, 1947.(In connection with Suárez's own theory, this disputation presents an overview of medieval doctrines of distinction.)

Suárez, F. (1597e) *The Metaphysics of Good and Evil according to Suárez: Metaphysical Disputations X and XI and Selected Passages from Disputation XXII and Other Works*, trans. J.J.E. Gracia and D. Davis, München: Philosophia, 1989.(These disputations contain Suárez's basic metaphysical optimism, and the translation contains a good introduction plus a very useful glossary.)

Suárez, F. (1597f) *On Efficient Causality: Metaphysical Disputations 17, 18, and 19*, trans. A.J. Freddoso, New Haven, CT: Yale University Press, 1994.(These disputations give an excellent overview of the medieval Aristotelian tradition as well as Suárez's own teaching on efficient causality.)

Suárez, F. (1597g) *On the Essence of Finite Being as Such, on the Existence of that Essence and their Distinction (Disputatio XXXI)*, trans. and intro. N.J. Wells, Milwaukee, WI: Marquette University Press, 1983.(Contains Suárez's famed denial of the real distinction of essence and existence in creatures.)

Suárez, F. (1597h) *On Beings of Reason (De Entibus Rationis): Metaphysical Disputation LIV*, trans. and intro. J.P. Doyle, Milwaukee, WI: Marquette University Press, 1995.(This disputation was very influential for the development of late scholastic intentionality theory.)

Suárez, F. (1607) *De immunitate ecclesiastica a Venetis violata (On the Ecclesiastical Immunity Violated by the Venetians)*, in J.B. Malou (ed.) *Opuscula sex inedita*, Brussels and Paris: Greuse, 1859.(Treatise on the superiority of papal authority over that of the Venetian republic.)

Suárez, F. (1612) *De legibus seu de Deo legislatore (On Laws or on God the Legislator)*, in L. Pereña *et al.* (eds) *Corpus Hispanorum de Pace*, vols 11-7, 21-2, Madrid: Consejo Superior de Investigaciones Cientificas, 1971-81.(A Latin-Spanish edition of *De legibus*, with good commentary and excellent footnotes.)

Suárez, F. (1612-21) *Selections from Three Works of Francisco Suárez, S.J.*, trans. G.L. Williams *et al.*, in J.B. Scott (ed.) *Classics of International Law* 20, Oxford: Clarendon Press, 1944, 2 vols.(Translates passages from the *De legibus*, *Defensio fidei*, and a section from the treatise 'On Charity' which contains Suárez's teaching on war.)

Suárez, F. (1613) *Defensio fidei catholicae adversus anglicanae sectae errores, cum responsione ad apologiam*

pro juramento fidelitatis et praefationem monitoriam serenissimi Jacobi Angliae Regis (Defence of the Catholic Faith against the Errors of the Anglican Sect, with a Reply to the 'Apology' for the 'Oath of Fidelity' and the 'Warning Preface' of James, the Most Serene King of England), Coimbra; in F. Suárez, *Opera omnia*, vol. 24, Paris: Louis Vivès, 1856-66.(Outlines Suárez's political philosophy; the work's opposition to absolute monarchy lead to its public condemnation in England.)

Suárez, F. (1614) *Defensio fidei III. Principatus politicus o la soberania popular (Defence of Faith III: the Political Supremacy of Popular Sovereignty)*, trans. and ed. E. Elorduy and L. Pereña, Madrid: Consejo Superior de Investigaciones Cientificas, 1965.(A Latin and Spanish edition of part of the *Defensio fidei*, with good introduction and notes.)

Suárez, F. (1614) *De juramento fidelitatis (On the Oath of Fidelity)*, trans. and ed. L. Pereña, V. Abril and C. Baciero, with A. Garcia and C. Villanueva, in *Corpus Hispanorum de Pace*, vol. 19, Madrid: Consejo Superior de Investigaciones Cientificas, 1978.(A Latin and Spanish critical edition of part of the *Defensio fidei*, with notes, bibliography and indices.)

Suárez, F. (1620-1) *De anima (On the Soul)*, ed. and intro. S. Castellote, foreword by X. Zubiri, trans. into Spanish by C. Baciero and L. Baciero, vols 1-3, Madrid: Sociedad de Estudios y Publicaciones, 1978-91.(A critical Latin edition, with Spanish translation, of Suárez's *De anima* which incorporates the manuscript changes left by Suárez himself.)

Swedenborg, Emanuel (1688-1772)

Swedenborg was an eighteenth-century Swedish dignitary of considerable learning who believed that he had the power to communicate with spirits and angels and that these beings would help him fulfil the task allotted to him by God, namely to reveal the hidden meaning of Scripture and to usher in the new Church. His thought attracted the critical attention of no less a figure than Immanuel Kant.

Swedenborg was born in Stockholm to a prominent Lutheran cleric. At the age of eleven, he entered the University of Upsala, where he developed a keen interest in mathematics and natural philosophy. He was to pursue scholarly interests for the rest of his life. In 1716, Charles XII made him an honorary appointment to the Swedish Board of Mines. Swedenborg rose to the salaried position of Assessor Ordinary. Under this title, Swedenborg served the King with distinction in many different capacities, including that of statesman, engineer and geologist.

Swedenborg retired from the Board in 1747 to devote himself to biblical exegesis. He believed that God had given him the power to communicate with angels and spirits so that he could reveal the hidden meaning of Scripture. In 1756, he published anonymously the *Arcana coelestia*, a massive line-by-line commentary on Genesis and Exodus.

Stories about Swedenborg's prophetic gift began to spread throughout Europe at this time. In 1756, during a dinner party in Gotenborg, Swedenborg claimed to see a fire spreading in Stockholm fifty miles away. He described the catastrophe in such minute detail that his vision could be checked against reports from the stricken capital which arrived in Gotenborg shortly thereafter. These reports apparently confirmed Swedenborg's vision on every point. Swedenborg had now made his name as a visionary. More stories added to his fame and excited interest in the *Arcana coelestia*, which was now known to be his work.

The problem is what to make of Swedenborg. Was he a prophet, a lunatic, or a man with questions too difficult to answer by the usual methods of scientific enquiry? Whatever else we might think, it is important to understand that Swedenborg saw himself as a Church reformer. He believed that the Church had lost sight of a fundamental truth, namely that God is one and operates through all of creation. The Nicene Council was the first indication of spiritual myopia, because it ruled that there have been three distinct divine persons from eternity. According to Swedenborg, this was to make three different gods out of the Father, Son and Holy Spirit (see Trinity). Worse, it encouraged us to represent the Trinity as a council of human dignitaries, or even as a gang of thugs such as the Triumvirate at Rome. The polytheism of the Nicene Council and its attendant heresies were transmitted to the Roman Catholic Church, and from that Church to all the reformed Churches of Swedenborg's day. Swedenborg's mission was to right such wrong thinking and to prepare us for salvation in the new Church. His strategy was simple: he had only to describe his encounters with angels and spirits. Thus he reported how angels set him on the right path and how the spirits of churchmen revealed themselves in an otherworldly burlesque show as the buffoons they had been all along. Swedenborg found followers, not least the young William Blake. The Swedenborgian church is alive to this day.

Swedenborg thought that philosophers had as little spiritual insight as churchmen. Since they could not see spiritual things, as Swedenborg did, they could never formulate a true metaphysics of immaterial substances. So Swedenborg complained that metaphysics is all conjecture. He illustrated his complaint with reports of his discussions with the spirits of metaphysicians. Once, he said, they discussed the mind-body union. Swedenborg watched as the spirits divided into three camps representing the three hypotheses of the day: occasionalism, pre-established harmony and real interaction. When the discussion became acrimonious, a neutral spirit arrived to settle things. He invited a representative from each camp to write his favourite hypothesis on a slip of paper. The three slips of paper were put in a hat, and the spirits drew lots. Not surprisingly, Swedenborg's way of understanding things won the day. The lot chosen from the hat was 'spiritual influx', which Swedenborg interpreted as his own view that all life and wisdom flows from God into the human soul and from the human soul into the body.

Swedenborg was right at least about rational psychology. Champions of the different systems of mind-body union claimed to offer nothing more than hypotheses. The only way to make progress in the debate was to discredit the rival systems, and one might have concluded that too many opposing metaphysicians had done too good a job of

that. Swedenborg was frustrated by the apparent futility of the debate. He assumed that metaphysicians themselves would lose patience, if they had not done so already, and succumb to temptation - namely to simplify things by denying the existence of anything immaterial (including the rational soul) and to think that material nature operates under its own steam. They would come to think that God and nature are one. Swedenborg apparently believed that Spinozism results when human reason applies itself to metaphysics (see Spinoza, B. de). In this, he was to anticipate Jacobi.

Swedenborg himself believed that everything in material nature flows out of the thoughts of angels and spirits and that the power of thought in angels and spirits flows ultimately from God. This is the basis of his 'correspondence' theory. Accordingly, every material thing 'corresponds' to the spiritual thing of which it is an effect. Thus cows correspond to angels thinking about the affections of nature-bound minds; sheep correspond to angels thinking about spiritually uplifted minds, and so on. The correspondence theory is in turn the basis of Swedenborg's biblical exegesis. Swedenborg believed that every word in Scripture expresses a correspondence.

Swedenborg had a wide influence. His ideas were of interest to Emerson, Jaspers and Kant (§2). Kant became convinced in the mid-1760s that Swedenborg's visions were somehow emblematic of fundamental errors in Kant's own metaphysics. In 1766 he published a devastating self-critique in the guise of a satirical review of Swedenborg's *Arcana coelestia*. The title of Kant's review was *Dreams of a Spirit-Seer*. The writing of this review was to move Kant by 1770 to treat our representations of space and time as subjective forms of sensibility - an important step in the direction of his considered views in the *Critique of Pure Reason* (1781).

Symbolic interactionism

Symbolic interactionism is in the main a US sociological and social psychological perspective that has focused on the reciprocal relationship between language, identity and society. Philosophically it has largely been associated with pragmatists such as James (1907), Mead (1934), Dewey (1922) and Pierce (1958), although in the European context it has affinities with hermeneutics and phenomenology. In addition, it has links with various 'dramaturgical' approaches to communication that emphasize the interactive processes underpinning the construction, negotiation, presentation and affirmation of the self. In brief, symbolic interactionism is premised on the supposition that human beings are 'active' and not 'reactive'.

Although it is not easy to spell out the central propositions of Symbolic Interactionism in a systematic way, nevertheless, most of its proponents are committed to an interactive view of self and society, that is, they take issue with those views that see the social world as a seamless unity that completely encapsulates and determines individual conduct.

1 The language matrix

Very simply, this assumption suggests that the mind, self and society cannot be explained as separate phenomena. Their existence depends upon the way in which persons talk, interact, and communicate. Language, spoken or otherwise, is the medium through which men and women come to know themselves as individuals and members of social groups. In other words, the distinction between subjectivity and objectivity is always a matter of convention and historical situation. A person can only bear witness to their inner states and experiences in a shared symbolic context.

2 Reflexivity: the self and language

A critical thing about language for symbolic interactionism is its reflexivity, that is, its self-referring properties. Language allows a person to see themselves from the point of view of others, but simultaneously, it opens up the possibility of internal dialogue and debate. Hence, thinking is not a solitary activity, but is of necessity social. 'I think' because others around me talk to me. Accordingly, even the most private aspect of a person's inner life is somehow framed and performed as a conversation between social actors. Thought processes, in this view, replicate the dynamics of everyday communication. It could be said, although very circumspectly, that for symbolic interactionists, there is no distinction to be made between private and public language.

For symbolic interactionists, like Blumer (1969), it is reflexivity that makes it possible for people to overcome the limits set by social and physiological forces. Language, in this sense, is both liberating and imprisoning. It is liberating because it enables a person to envisage and construct alternative futures and pasts, and it is imprisoning because it often seems to coerce our sense of self.

3 The self as social

Perhaps more than anything else it is the symbolic interactionist view of the self as a social process that distinguishes it from other approaches. Against those versions of self that see it in terms of some underlying agency, symbolic interactionism highlights the tentativeness of all claims about the self. Nothing can be asserted about the self that does not meet the test of the situation or context. Put differently, this means that every social encounter may involve a different kind of self activity. So instead of a unitary self, the typical self in symbolic interactionist literature is multiple and episodic. Logically this means that there are as many selves as there are situations - perhaps an absurd proposition.

However, the apparent situatedness of the self is premised on some kind of notion of biographical continuity. Who I claim to be now, depends to a large extent on my past history. Even though each new interpersonal encounter may evoke a new way of 'presenting' myself, I am none the less not detached from earlier encounters. I have not invented my gender, class and ethnic affiliations, nor have I acquired my ability to speak and write my language in a random haphazard way. What this means therefore, is that biography always enters into interaction episodes, but simultaneously, biography is modified and challenged in interpersonal situations. In short, the self is constituted in the dialogue between the contingencies of everyday life, and the consequences of past interactions with significant

others like parents, teachers, siblings and peers.

4 Motives, intentions and identities as social constructions

In positing a social origin and deployment of the self, the symbolic interactionist takes issue with theories of behaviour that assume that human action is governed by drive-like motives. Motivation can only be understood in terms of the accounts, intentions, excuses, rationalizations of persons who live in a definite cultural milieu. In other words, motives are the meanings attributed to subjective states by persons participating in social encounters. At the same time, although motives are social, from the point of view of the individual, they are ‘real’. The agent’s ‘definition of the situation’ is thus a crucial aspect of any ongoing interaction episode.

Motives, then, are meanings that we give to our actions, and in the final analysis, these meanings are only significant if they are validated socially. They can be understood solely within the rubric of what people do and say as members of a society. For example, it makes no sense to talk of ambition in a context in which competition or achievement are not part and parcel of everyday activity. On the other hand, in most mundane situations, motives are taken for granted. We impute motives as a normal feature of our relationship with others.

For symbolic interactionists, the question of motives is also a question of identity. Who I believe myself to be is connected with what I believe I desire or want. The identity that I value also may be the reason for my actions. Be that as it may, both motives and identities are fashioned in social interaction.

5 Society

The symbolic interactionist view of society does not give it some overarching explanatory power. Society is what people do when they interact with each other in a multiplicity of situations. What we call society consists of literally countless encounters between people who talk, agree, argue and negotiate meanings and identities. In general, all interaction is sustained by implicit understandings of ‘what is the case’. Each new encounter is gained by some kind of background knowledge about the manner in which interactions work. We know what to do when we greet a friend, because in the past we have found occasion to learn what is meant by ‘friend’ and the requirements of a ‘greeting’.

Basically what this entails is seeing society as a communicative network in which participants are engaged in a ceaseless interpretive exercise to maintain some sense of order and identity. In this respect, society is never at rest - it is always in the process of being produced in interaction. At any one time the members of groups, collectivities, or institutions create and produce the conditions of their membership. Even a most rigidly structured bureaucratic institution, such as the army, depends on the reciprocal interaction of soldiers, officers and other ranks who interpret and monitor each others’ behaviour.

This does not mean that social order is simply a matter of *ad hoc* negotiation. What is negotiated is constrained by what has been negotiated in the past. While symbolic interactionists believe that individuals ‘make’ history, they also argue that what is ‘made’ has consequences for future interaction. Thus we have a picture of society as a set of flowing and volatile self-other processes intermeshing with an already interpreted history that profoundly influences the alternatives perceived as being possible in the present (see Society, concept of §§1, 3).

There are a number of objections that may be raised in conceiving of society in this way. First, there are situations in which negotiation appears to be irrelevant. How do concentration camp inmates negotiate with the functionaries who torture and incinerate them? There is not much scope here for the construction of new identities and meanings. Second, it may be that the symbolic interactionist picture of society is far too optimistic, and that it operates with an over-romanticized conception of human potentiality, a conception that gives the ‘underdog’, the ‘rebel’, and the ‘deviant’ almost superhuman status. Third, in its eagerness to demonstrate how selves and motives are socially constructed, it relies too heavily on the reflexive fecundity of language.

It could be argued that these objections are not only applicable to Symbolic Interactionism, but also to most social constructionist positions that give explanatory primacy to language. On the other hand, some of these criticisms may be misconceived because they have not taken into account the fact that Symbolic Interactionism is not a codified theoretical position, but is rather an orientation that questions the reifications of mainstream social science, as well as mocking and even subverting the myths and pretensions of policy makers and cultural

ideologues.

Syntax

Syntax (more loosely, 'grammar') is the study of the properties of expressions that distinguish them as members of different linguistic categories, and 'well-formedness', that is, the ways in which expressions belonging to these categories may be combined to form larger units. Typical syntactic categories include noun, verb and sentence. Syntactic properties have played an important role not only in the study of 'natural' languages (such as English or Urdu) but also in the study of logic and computation. For example, in symbolic logic, classes of well-formed formulas are specified without mentioning what formulas (or their parts) mean, or whether they are true or false; similarly, the operations of a computer can be fruitfully specified using only syntactic properties, a fact that has a bearing on the viability of computational theories of mind.

The study of the syntax of natural language has taken on significance for philosophy in the twentieth century, partly because of the suspicion, voiced by Russell, Wittgenstein and the logical positivists, that philosophical problems often turned on misunderstandings of syntax (or the closely related notion of 'logical form'). Moreover, an idea that has been fruitfully developed since the pioneering work of Frege is that a proper understanding of syntax offers an important basis for any understanding of semantics, since the meaning of a complex expression is compositional, that is, built up from the meanings of its parts as determined by syntax.

In the mid-twentieth century, philosophical interest in the systematic study of the syntax of natural language was heightened by Noam Chomsky's work on the nature of syntactic rules and on the innateness of mental structures specific to the acquisition (or growth) of grammatical knowledge. This work formalized traditional work on grammatical categories within an approach to the theory of computability, and also revived proposals of traditional philosophical rationalists that many twentieth-century empiricists had regarded as bankrupt. Chomskian theories of grammar have become the focus of most contemporary work on syntax.

1 The need for structure

One central aim of *semantics* is to explain how the meaning of a sentence (or any other complex expression) is a function of the meanings of its parts (see Compositionality), a project that presupposes an understanding of how the parts are put together, that is, an understanding of its *syntax*.

Let us call any sequence of words a 'string'. The following strings can be put together from the list of words 'Bill', 'slept', 'soundly', 'last' and 'night':

(1) (a) Bill slept soundly last night
(b) last night Bill slept soundly
(c) *last soundly Bill slept night
(d) *night Bill soundly last slept.

There is a clear difference between, on the one hand, (1a) and (1b) and, on the other, (1c) and (1d). In ordinary talk, the former are *sentences*; the latter are not. (Asterisks indicate non-sentences.) In order for a string of words to be a sentence (in this ordinary sense) the words must be put together in a certain way. Syntax is, in part, the study of the rules (or conditions) that determine the way that sentences are structured. The order of words in a string does more than determine whether or not a string is a sentence; it also plays a role in determining meaning. Compare (2a) and (2b):

(2) (a) The dog chased the cat.
(b) The cat chased the dog.

The fact that (2a) and (2b) differ in meaning cannot be a consequence of their containing words with different meanings, since they contain precisely the same words. The difference in meaning is attributable to a difference in *word order*. In the terminology of traditional grammar, in English we understand a noun phrase preceding a verb (in the active voice) as the subject, and the noun phrase following that verb as its direct object. Not all languages mark the subject-object distinction in this way. Thus, for example Latin marks it by inflection and this allows for the possibility of much freer word order.

Initially, the following generalizations might seem reasonable: (a) sentence meaning is the product of word meaning and word order; (b) a difference in word order results in a difference in sentence meaning. But in fact neither is accurate. Although a change in word order frequently results in a change in meaning, sentences (1a) and (1b) above show that this is not always the case, so (b) is incorrect. To see that (a) is incorrect consider

(3) Mary said Bill left voluntarily.

This admits of two distinct interpretations (or readings), which can be paraphrased as (a) 'Mary said that Bill left and she said this voluntarily' and (b) 'Mary said that Bill left and that he did so voluntarily'. It is as if the word 'voluntarily' can be understood in connection with either the saying or the leaving. Sentence meaning, then, is the product of more than word meaning and word order; it is the product of word meaning and sentence structure, and there is more to the sentence structure than the linear order in which its words appear: the way in which the words are grouped is crucial. One way of cashing out this idea might be to say that 'voluntarily' can be understood as an attachment either to the sentence 'Mary said Bill left' or to the smaller sentence 'Bill left'. Using square brackets to group parts of the sentence, we can represent the two different interpretations of (3) as follows:

(4) (a) [Mary said [Bill left]] voluntarily.
(b) Mary said [[Bill left] voluntarily].

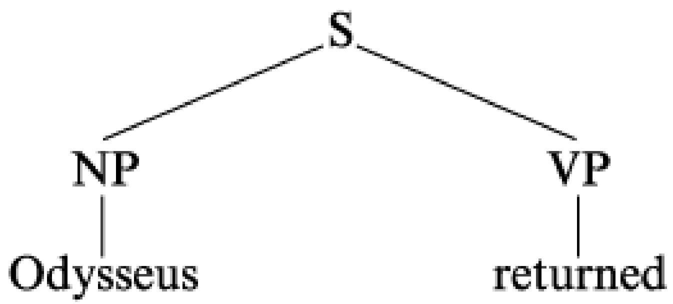
In a sense that we can make precise, the moral of an example such as (3) is that the *hierarchical* organization (grouping) of the words in a sentence is just as important as their *linear* organization. (In terms explained in §5 below, the *scope* of 'voluntarily' is different in (4a) and (4b).)

2 Syntactic categories and constituent structure

The use of syntactic theory in projects such as compositional semantics requires that the theory have some systematic way of describing the syntax of sentences. The ways in which grammatical theories can describe linguistic structure are varied, but the following exposition will illustrate the most common. Since we are not here concerned with the internal structure of words (their morphology), let us say that words are the 'ultimate constituents' of sentences. The two parts of the sentence 'Odysseus returned' correspond to the traditional distinction between subject and predicate. Of course, both subject and predicate expressions can be more complex. If we replace the subject expression 'Odysseus' in 'Odysseus returned' by 'the hero', 'no hero' or 'a hero as great as godlike Achilles', in each case the result is another sentence. Since all of these expressions are built upon nouns, they are said to belong to the category of noun phrase (NP).

If we replace the verb 'returned' in the sentence 'Odysseus returned' by 'loves Penelope', or 'shaves another customer', in each case the result is another sentence. Since expressions in predicate position are (typically) based on verbs, they are said to belong to the linguistic category of verb phrase (VP). Using 'S' for 'sentence', we can represent the syntactic structure of the sentence 'Odysseus returned' using a 'phrase structure tree' (or 'phrase marker') as follows:

(5)



Alternatively, we can represent exactly the same syntactic information using a 'labelled bracketing':

(6) $[_{\mathrm{S}}[_{\mathrm{NP}}\,\mathrm{Odysseus}][_{\mathrm{VP}}\,\mathrm{returned}]]$.

(5) and (6) are notational variants of one another, they are equivalent descriptions of the same structure - 'structural descriptions' - that is, tree notation and bracket notation are two informationally equivalent ways of specifying syntactic structure.

We can begin to characterize a set of sentences by formulating a rule to the effect that an NP followed by a VP forms a sentence, S. The standard way of doing this is to use a 'phrase structure rule' (or 'rewrite rule'):

(7) $\mathrm{S} \Rightarrow \mathrm{NP} + \mathrm{VP}.$

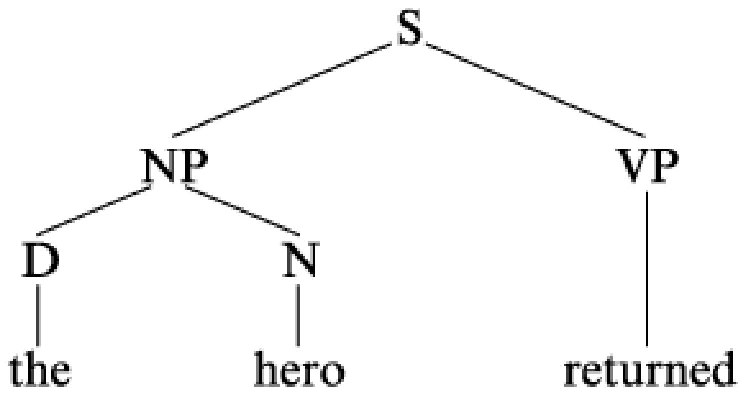
This is read as 'S goes to NP VP'. All (7) says is that a sentence, or S, may be composed of an NP followed by a VP.

Let us turn now to the internal structures of NPs and VPs. Many NPs appear to be composed of words belonging to the traditional grammatical categories of article (for example, 'the', 'a') and noun (for example, 'cat', 'man'). Rather than using the category of article, let us use the broader category of *determiner* that includes not just 'the' and 'a', but also, for example, 'every', 'some', 'no', 'neither' and 'one'. We can represent the fact that an NP may be composed of a determiner (D) and a noun (N) using the following phrase structure rule:

(8) $\mathrm{NP} \Rightarrow \mathrm{D} + \mathrm{N}.$

Now we can provide a phrase structure tree for 'The hero returned' using the rules in (7) and (8):

(9)



Or we can use a labelled bracketing:

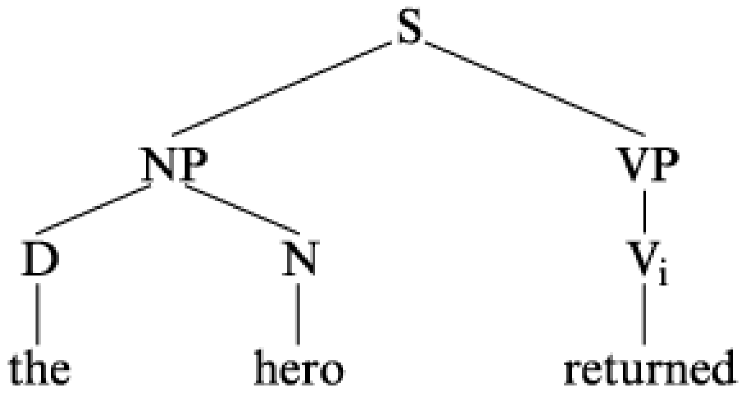
(10) $[_{\mathrm{S}}[_{\mathrm{NP}}[_{\mathrm{D}}\mathrm{the}][_{\mathrm{N}}\mathrm{hero}]][_{\mathrm{VP}}\mathrm{returned}]].$

Some VPs may contain NPs as parts, for example, 'loves Penelope', and 'shaves another customer' (see above). Unlike verbs such as 'return' and 'snore', verbs like 'see' and 'respect' are *transitive*: they take NPs as direct objects. We have, then, at least two types of VPs to examine: those 'headed by' (that is, built around) intransitive verbs (V_is), such as 'return' and 'snore', and those headed by transitive verbs (V_ts), such as 'respect' and 'like'. Consequently, we need at least two phrase structure rules for VPs:

(11) $\mathrm{VP} \Rightarrow \mathrm{V_i}$
(12) $\mathrm{VP} \Rightarrow \mathrm{V_t} + \mathrm{NP}.$

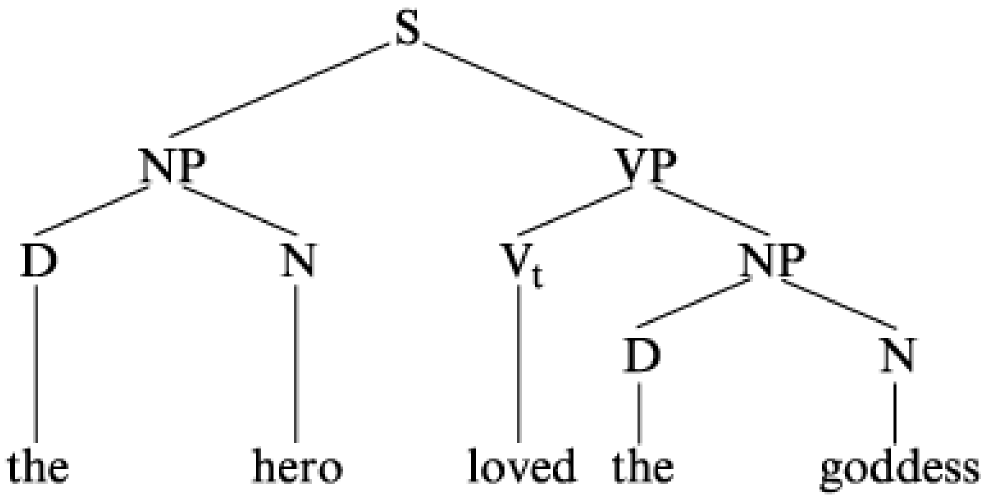
The syntax of 'The hero returned' can now be spelled out in more detail:

(13)



The syntax of 'The hero loved the goddess' is given by

(14)



3 Phrase structure grammars

Not only do philosophical applications of syntactic theory require a set vocabulary for describing linguistic structure, they require linguistic theories to specify well-formed linguistic structures in a finite way. Contemporary syntactic theory offers just such resources.

One aim of what Chomsky has called ‘generative grammar’ is to articulate a finitely statable theory that generates all and only the phrase markers of a given language. With the resources made available in the previous section, we can construct a generative grammar for a fragment of English. For purposes of illustration, we can do this by articulating a ‘phrase structure grammar’. Such a grammar can be viewed as a formal system consisting of two parts: a ‘lexicon’ (a list of words together with a specification of the grammatical category of each word), and a set of phrase structure rules specifying how words from these categories may be put together to form sentences. In effect, then, a grammar is a theory, and like any other theory its usefulness lies in its predictive power. For any string of English words, the theory must say whether or not that string is a sentence. The following is a simple generative grammar:

Lexicon

$$\begin{aligned} \mathrm{PN} &= \{\mathrm{Fred, Mary, Bill}\} \\ \mathrm{D} &= \{\mathrm{a, every, the}\} \\ \mathrm{N} &= \{\mathrm{man, woman}\} \\ \mathrm{V_i} &= \{\mathrm{left, returned}\} \\ \mathrm{V_t} &= \{\mathrm{likes, respects}\} \end{aligned}$$

Phrase structure rules

$$\begin{aligned} \mathrm{S} &\Rightarrow \mathrm{NP + VP} \\ \mathrm{NP} &\Rightarrow \mathrm{PN}\ (\text{‘proper name’}) \\ \mathrm{NP} &\Rightarrow \mathrm{D + N} \\ \mathrm{VP} &\Rightarrow \mathrm{V_i} \\ \mathrm{VP} &\Rightarrow \mathrm{V_t + NP} \end{aligned}$$

Notice that each of the phrase structure rules has the following form:

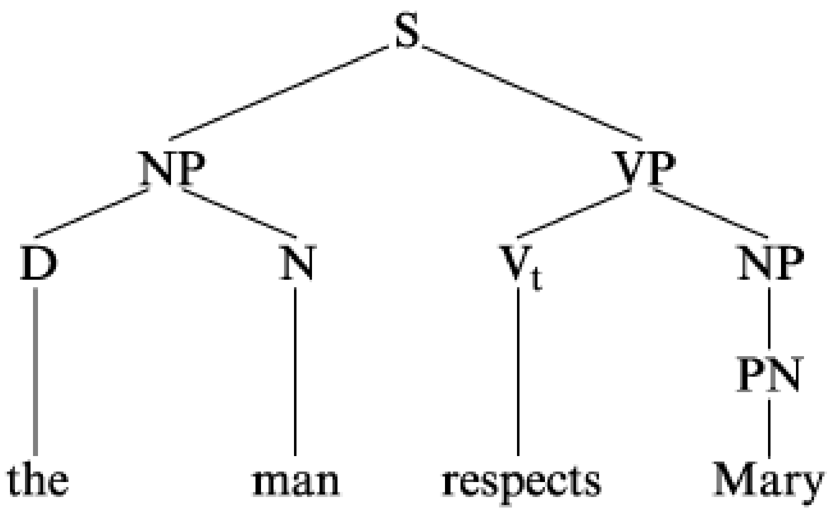
(15) $\alpha \Rightarrow \beta_1 + \ldots + \beta_n.$

The important feature here is that in each rule of this type exactly one symbol α appears on the left-hand side of ‘$\Rightarrow$’. Such rules are called ‘context-free’ phrase structure rules, the idea behind the terminology being that they are blind to whatever symbols may appear on either side of α, that is, they are blind to the syntactic ‘context’ in which α appears. The systematic use of a set of context-free rules is a way of formalizing traditional work on

grammatical categories within an elegant approach to the theory of computability (or recursive functions); a context-free phrase structure grammar is equivalent to a categorial grammar in the sense of Ajdukiewicz (1935; see Ajdukiewicz, K. §5).

In a sense to be defined, the grammar just given generates the following phrase structure tree:

(16)



There is a specialized vocabulary in formal language theory (mathematical linguistics) for describing the parts of phrase structure trees and the relationships that obtain between the parts. We can tailor some of this vocabulary, rather informally, to suit our concerns:

(i) Each position in a tree is a *node*. A line connecting two nodes is a *branch*.

So, for example, in (1) there are twelve distinct nodes: S, NP, VP, D, N, V_t, PN, 'the', 'man', 'respects' and 'Mary'. Branches connect D and 'the', NP and D, and NP and N.

(ii) The S node at the 'top' of a tree is the *root node* of that tree. The words at the 'bottom' of a tree are its *leaf nodes* (or *terminal nodes*).

We are concerned with (a fragment of) English, so every leaf node will be a word of English.

(iii) A sequence of branches that connects two nodes is a *path*. Node β is *properly dominated* by node α if and only if the path from β back to the root node passes through α. The set of nodes properly dominated by node α is the *proper domain* of α.

Example: in (16) there is a path between D and 'the', and a path between S and D. Indeed, there is a path between any two distinct nodes. Additionally, D properly dominates 'the', NP properly dominates D, N, 'the' and 'man', and S properly dominates every node in the tree (apart from itself). (It dominates but does not properly dominate itself, just as a set is a subset but not a proper subset of itself.)

(iv) Each node in a tree corresponds to a *constituent* of the sentence in question.

So, for example, in (16) the NP node corresponds to the constituent 'the man'; and the VP node corresponds to the constituent 'respects Mary'. So whereas 'the', 'the man', 'respects' and 'respects Mary' are constituents of (16), 'man respects', 'man respects Mary' and 'the man respects' are not.

(v) If Γ is a phrase structure grammar and τ is a tree, then Γ *generates* τ if and only if
(a) the root node of τ is S;
(b) every terminal node of τ is in the lexicon for Γ; and
(c) every step from the root node to the string of terminal nodes is licensed by one of the phrase structure rules of Γ.
(vi) A *string* of Γ is a linear sequence of words taken from the lexicon for Γ. Γ *generates a string* Σ if and only if Γ generates a tree for Σ.

(vii) The set of strings generated by a grammar Γ is the *language* L_Γ of Γ, that is, the set of *sentences* of L_Γ.

An interesting feature of (vii) is that it appropriates the English words ‘language’ and ‘sentence’ and assigns them technical meanings. Later, the theoretical use of these words will be specified precisely to satisfy theoretical demands that arise when syntax and semantics come together.

The picture just presented is deliberately simplified. Nevertheless, it is widely held that context-free grammars of this form are inadequate to describe natural languages. In addition to context-free rules of the type we have just discussed, Chomsky (1957, 1965) posited ‘transformational’ rules that operated on the trees generated by context-free phrase structure grammars to produce trees that could not be produced in any satisfactory way by phrase structure rules alone. For example, Chomsky wanted to explain the syntactic and semantic relationships between the active and passive voice and accomplished this by postulating a transformational rule that derived a phrase structure tree for a passive sentence from the tree for its corresponding active. Much work by generative linguists in the 1970s sought to impose a rigorous set of constraints on possible transformational rules. Beginning with Chomsky (1981), generative linguists began to explore alternative ways of generating sentences using methods that depart from those of traditional phrase structure grammars.

4 Recursion and sentential verbs

The grammar above was finite, as was the language that it generated (it consists of a finite number of sentences). There are, however, finite grammars that generate infinite languages. This can be seen easily enough in connection with philosophically interesting verbs such as ‘believe’, ‘know’, ‘prove’, ‘remember’ and ‘say’, which can be used in ways that preclude classifying them as either V_is or V_ts. Consider the following sentences:

(17) Mary believes (that) Fred left.
(18) Mary said (that) Fred left voluntarily.

The VPs in these sentences seem to consist of a verb combined with a whole sentence. Since they seem to take whole sentences as their complements, these can be called ‘sentential verbs’ (V_s). Let us now add some V_ss to our lexicon:

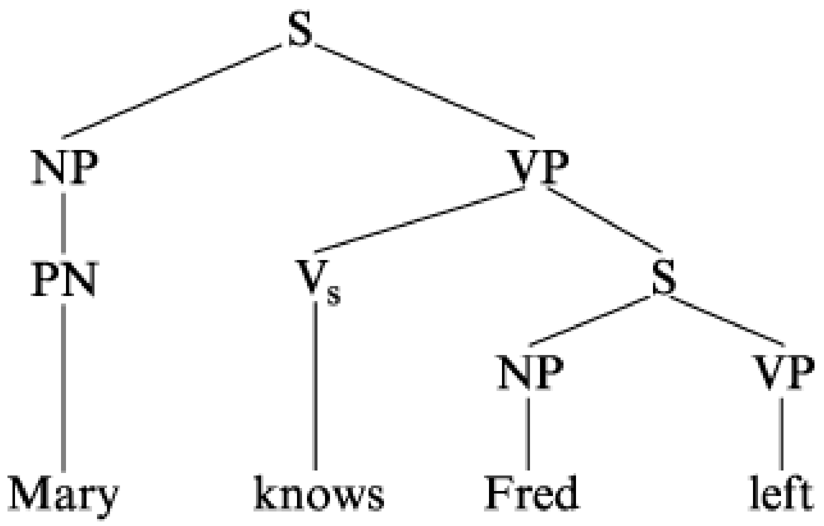
V_s = {believe, know, doubt, say, suggest, realize, remember, prove}.

(Some V_ss are also known as ‘*psychological* verbs’ or ‘verbs of propositional attitude’, a label due to Russell - see Propositional attitude statements; §5 below.) We can now add the following phrase structure rule to produce a new grammar:

(19) $\mathrm{VP} \Rightarrow \mathrm{V_s} + \mathrm{S}.$

The resulting grammar generates the following phrase marker:

(20)



As this tree diagram reveals, the rules ‘ $\mathrm{S} \Rightarrow \mathrm{NP} + \mathrm{VP}$’ and ‘ $\mathrm{VP} \Rightarrow \mathrm{V_s} + \mathrm{S}$’ taken together give our grammar the capacity to generate trees in which S nodes are properly dominated by other S nodes. More precisely, our grammar generates trees in which an S node properly dominates a VP node that properly dominates another S node that properly dominates another VP node that…. So, for example, the grammar generates trees for both of the following:

(21) Bill knows Mary thinks Fred left.
(22) Mary doubts Fred knows Bill said Mary left.

Clearly, there is no end to the list of sentences generated: if our grammar generates a sentence ϕ, it also generates every sentence of the form

$[_{\mathrm{S}}[_{\mathrm{NP}}\ldots][_{\mathrm{VP}}[_{\mathrm{V\,s}}\ldots]\phi]]$.

Despite containing a finite set of rules, it generates an infinite set of sentences (the language generated is infinite). A structure such as (20) in which a node of category X properly dominates a distinct node also of category X is a *recursive* structure. We now say that our grammar *recursively generates* an infinite set of sentences. The recursive nature of natural language is further revealed once connectives such as ‘and’, ‘or’ and ‘but’ are introduced. A primary function of connectives is to join two sentences - they may also be used to connect, for example, NPs and VPs - in such a way that the result is a larger sentence, as in

(23) Bill left and Mary returned.
(24) Bill snores or Mary snores.

The following phrase structure rule can therefore be postulated:

(25) $\mathrm{S} \Rightarrow \mathrm{S\ CONN\ S}$,

where CONN is the category ‘connective’. This rule exploits the possibility of having three symbols on the right-hand side of ‘ $\Rightarrow$’, but it is still a context-free phrase structure rule of the form given in (15). Recursive structures are also found in (for example) NPs containing relative clauses such as ‘the man who loves the woman who found the child who…’.

5 Scope

There are a number of semantic issues of independent philosophical importance that can be illuminated by appealing to syntactic structure. The nature of scope in natural language is an instructive case study (see Scope). The following strings are all ambiguous:

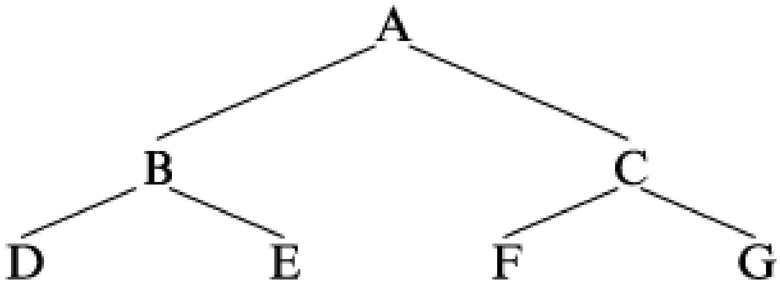
(26) (a) everyone strives for some good
(b) if I know that *p* then necessarily *p*
(c) the number of planets is necessarily greater than seven
(d) Bill returned or Fred returned and Mary left
(e) George thought the King wasn’t the King
(f) Mary said Bill left voluntarily.

For example, someone uttering (26a) might be understood as saying that there is some particular good such that everyone strives for it or merely that everyone strives for some good or other. All of these examples involve ambiguities of scope that can be explicated within sophisticated syntactic theories. For present concerns, we restrict ourselves to a simple case mentioned earlier involving the scope of the adverb ‘voluntarily’ as it occurs in a string such as (26f), which is ambiguous between readings corresponding to the syntactic structures given earlier by (4a) and (4b). To provide a general characterization of scope in terms of phrase structure is straightforward once we introduce some new notions. First,

(viii) Node β is *immediately dominated* by node α if and only if β is properly dominated by α and there is no intervening node γ, that is, no node γ such that α properly dominates γ and γ properly dominates β.

In the following diagram, A properly dominates every other node; in addition it immediately dominates B and C,

but not D, E, F or G:



(ix) If distinct nodes β and γ are immediately dominated by node α, then α is a *branching node*.

A, B and C are branching nodes; D, E, F and G are not. We can now define 'scope' in a phrase structure tree:

(x) The *scope* of node α is (the constituent corresponding to) the first branching node properly dominating α. Node β is *within the scope* of node α if and only if the first branching node properly dominating α properly dominates β.

So in (20), the scope of 'Mary' is the entire sentence, whereas the scope of 'Fred' is the smaller sentence 'Fred left'.

(xi) If node β is within the scope of node α and node α is not within the scope of node β, then α has larger scope than β (and β has smaller scope than α).

Thus 'Mary' has larger scope than 'Fred' in (20). The scope of 'knows' in this phrase marker is the VP 'knows Fred left'. Thus the name 'Fred' occurs within the scope of 'knows', but the name 'Mary' does not. This is widely held to have important logical consequences. If Mary is Elizabeth - that is, if 'Mary' and 'Elizabeth' are two names of the same person - then the truth of (21) guarantees the truth of

(27) Elizabeth thinks Fred left.

Now suppose that Fred is Bert. Does the truth of (21) guarantee the truth of (28)?

(28) Mary thinks Bert left.

Following Frege, many philosophers believe it does not. (Mary may not know that Fred is Bert.) If this is correct, then we can describe the situation syntactically: the fact that 'Fred' appears within the scope of a 'psychological' verb (in this case, 'think') means there is no guarantee that 'Fred' can be replaced by a coreferring name to produce a sentence with the same truth-value as the original. A name occupying such a position is said to occur in a context that is 'referentially opaque' (see Propositional attitude statements §§1-2).

6 Ambiguities of scope

We turn now to an example involving what is usually called a 'structural ambiguity' or an 'ambiguity of scope'. The latter label (due to Russell) is more dominant in philosophy, logic, and mathematics. As Russell pointed out, much bad philosophy has resulted from inattention to scope ambiguities. Indeed, uncovering and avoiding them are skills all philosophers must acquire. Davidson has emphasized the importance of an understanding of the semantics of adverbs to a number of philosophical questions involving actions and events. Earlier, the fact that the following string is ambiguous was used to call attention to the grouping of words within a sentence:

(3) Mary said Bill left voluntarily.

It was suggested that the ambiguity in question was structural in that the words can legitimately be grouped in two different ways:

(4) (a) [Mary said [Bill left]] voluntarily.
(b) Mary said [[Bill left] voluntarily].

We can implement this suggestion by providing distinct phrase markers corresponding to (4a) and (4b). We will consider two rival ways of doing this. The word ‘voluntarily’ belongs to the category of adverb, so let us add to our lexicon the following:

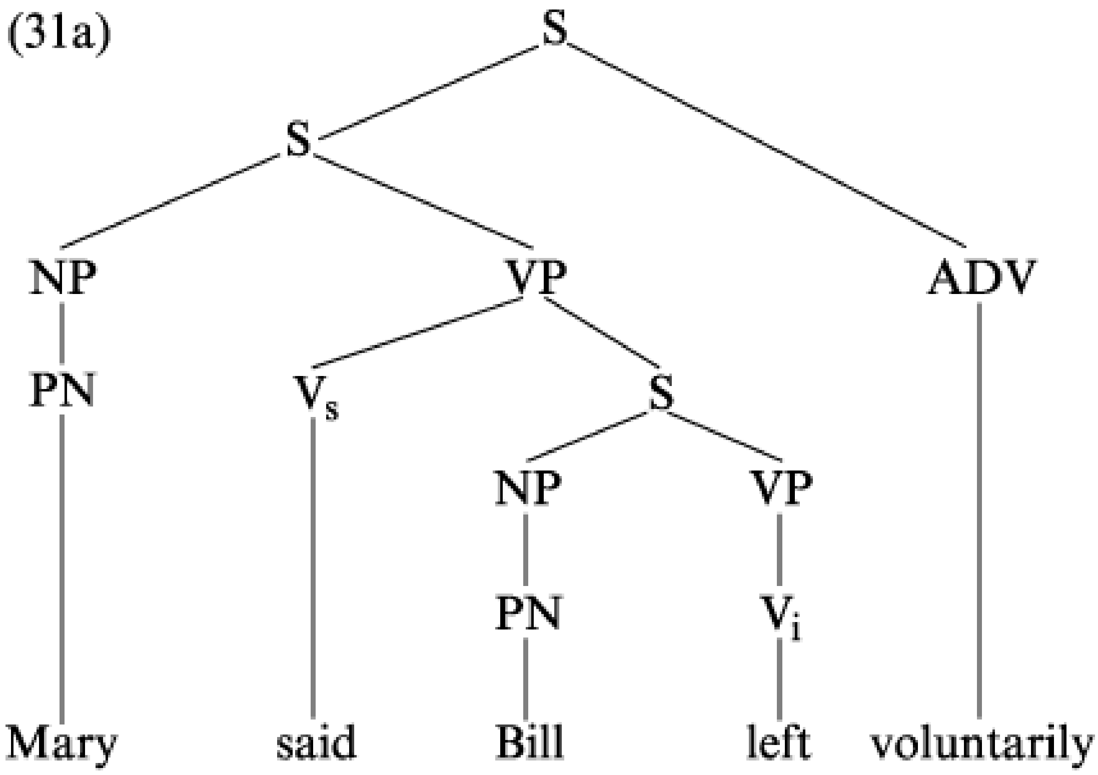
(29) ADV = {voluntarily, hastily, discreetly}.

In line with the informal account of the ambiguity suggested earlier, the first attempt to characterize the syntax of adverbs involves positing the following phrase structure rule:

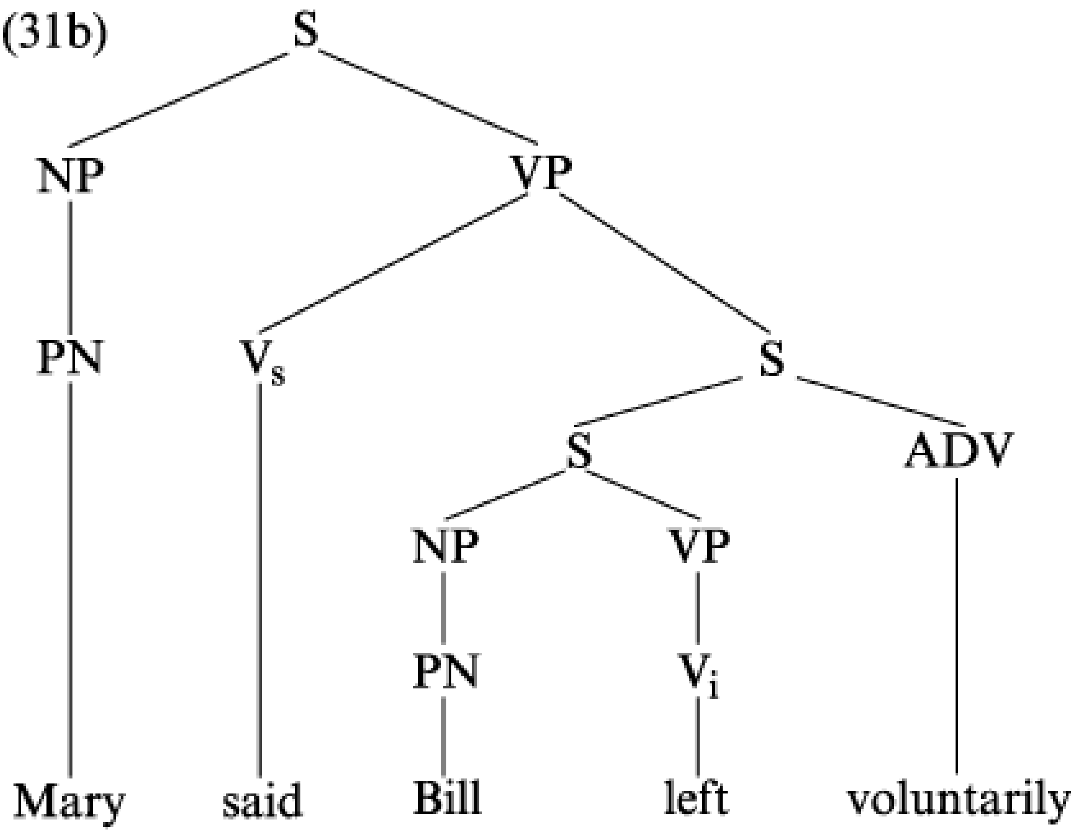
(30) $\mathrm{S} \Rightarrow \mathrm{S} + \mathrm{ADV}.$

The resulting grammar generates the following distinct phrase markers for (3):

(31a)



(31b)



In (31a) the scope - as defined above - of ‘voluntarily’ is the entire sentence. Thus the verb ‘said’ is within its scope. By contrast, in (31b) the scope of ‘voluntarily’ is just the smaller sentence ‘Bill left voluntarily’. Thus the verb ‘said’ is not within its scope, but the verb ‘left’ is. On the assumption that, as the etymology suggests, an adverb modifies a verb in some way, the verb it modifies is the main verb of the sentence to which it is attached. Thus (31a) corresponds to the reading of (3) that might be loosely paraphrased as ‘Of her own volition, Mary said that Bill left’ and (31b) corresponds to the reading that might be paraphrased as ‘Mary said that Bill left as a matter of his own volition’. (Of course, until an account is provided of how syntactic structure contributes to meaning, the pairing of distinct phrase markers with distinct readings of a string is largely intuitive.)

We now make two observations about our definition of scope. First, by the definition provided, every constituent has a scope; but there are only certain types of constituents whose scopes will interest us (usually, connectives, quantifiers, verbs and adverbs). Second, notice that it is not always the case that for two constituents one is within the scope of the other.

It is worth asking whether this is the best way of characterizing the syntax of sentences containing adverbs. An alternative account emerges if we take the etymology of ‘adverb’ more seriously and view ADVs as attaching to VP nodes rather than S nodes. Only detailed empirical and logical work will tell which of these analyses is better. The best theory may tell us that there are two distinct types of ADV: one sort that attaches to an S node, another that attaches to VP. There is no need for us to settle this difficult matter here. Suffice to say, that if we find that claims about the semantic properties of adverbs are doing some philosophical work, we will have to look carefully at their syntax.

More than a few philosophical muddles have been due to confusions over the scope of operators in natural language sentences. Utilizing the resources of syntactic theory, it becomes possible for us to study scope relations in a more rigorous fashion, and to marshal arguments for and against certain proposals about the logical form of natural language. Indeed, whenever we encounter philosophical claims which rely upon the semantic properties of quantifiers, adverbs and so on, we will want to look carefully at their syntactic properties. This specific point is just an instance of a quite general principle concerning the relationship between the philosophy of language and theoretical syntax: the former cannot properly proceed independently of the latter.

Systems theory in social science

'Systems theory' is a label for two very different approaches to social analysis. The first was a post-1945 successor to traditional organicist theories of society that for some twenty years dominated US sociology and political science. It was never very popular outside the USA, and is now of largely historical interest; social scientists who aspire to develop a positive science of social interaction have for the past two decades rested their hopes on the individualist analyses provided by rational choice theory.

Systems theory in the first sense of the term flourished in US sociology and political science from the late 1940s to the late 1960s, and is especially associated with the names of Talcott Parsons in sociology and David Easton and Gabriel Almond in political science. A systems approach to social analysis was commonly, though not universally, associated with some form of functionalism, especially in the work of Parsons, the leading structural-functionalist of his day. It fell into disrepute along with functionalism, a victim of the changed political climate of the 1960s as much as of its purely intellectual weaknesses.

The second form of systems theory is associated especially with the name of Niklas Luhmann, and its leading critic is Jürgen Habermas. The second form is in vigorous life, but not well known in the USA.

1 The organicist background

Systems theory in this sense inherited the assumptions of traditional organicist theories of society. The belief that social analysis must be grounded in a distinctively holistic and organic approach to its subject matter was characteristic of conservative critics of eighteenth-century rationalism such as Edmund Burke; its philosophical defence was one of those few of Hegel's achievements that Marx unhesitatingly applauded (see Hegel, G.W.F.). In part, this was a way of staking out a terrain for sociology distinct from the terrain of economic analysis. The conservative implications of these ideas as understood by writers such as Burke and Hegel were not intrinsic to an emphasis on the organic character of society. Few thinkers were more conscious of the depth of social and economic conflict than Karl Marx, and his belief that social and economic relations formed a system of exploitation was one of the things that persuaded him that revolution rather than reformist tinkering was demanded.

At the end of the nineteenth century, liberals, too, rested their hopes on a new, more organic conception of society than they thought their predecessors - particularly the British utilitarians - had attained. In France, Émile Durkheim (§2) defended an extreme holism as to sociological method. So widely felt was the wish to ground ethics in sociology and to rescue liberal politics from exaggerated individualism that one might think it part of the *fin de siècle* spirit of the age (see Holism and individualism in history and social science).

This conception of the social organism fell into (something like) disrepute after the First World War; the obvious dissimilarities between a society and organisms such as fish, sheep or human beings had, of course, never been denied by nineteenth-century social thinkers, but they had perhaps not appeared to be worth mentioning in the course of arguments intended to emphasize that, whatever else they might be, societies were not established by freely contracting, independently formed, self-sustaining and autonomous individuals. Turn of the century liberal organicists had no such conservative purposes as, say, Burke had had, but the association of organicism with authoritarianism and irrationalism, however, was subsequently sufficient to damn it in the eyes of most interwar liberal thinkers.

2 The modern revival

Not every work that stresses the idea of system rests on such a form of systems theory. Kenneth Waltz's *The Theory of International Politics* (1979), is perhaps the most famous work in the field in the past two decades; it strongly emphasizes the opportunities and constraints that membership of an international system of states offers to and imposes on each state in the international system. It is, for all that, concerned with the international system as a balance of opposed forces, not with its quasi-organic qualities as something self-maintaining, self-reinforcing, and self-repairing. It is systems theory in this latter sense that was briefly popular, and so harshly criticized.

Several representative samples will stand for many. Talcott Parsons (1950) provided a framework for social

analysis that saw the social system as a system of interaction, or, as he put it an 'action-system'. The system as a whole was made up of four sub-systems: in effect, the economic, cultural, political and psychological aspects of a social order. It is important to emphasize that these 'sub-systems' were defined in terms of function, not concretely in terms of institutions. These functions included such things as socializing individuals into an acceptance of the local norms of sexual identity and moral conviction, or organizing their efforts at producing and distributing the means of life. Understanding how this was achieved was equally a matter of asking how social norms affected the orientation of individuals towards interactions with others: for instance, whether we treat each other instrumentally or in terms of some non-instrumental moral norm.

Much the same controversy beset systems theorists in political science, although none of them produced the elaborate categorical system that Parsons had produced; nor did they arouse the same intensity of discipleship and opposition. David Easton (1953) represented the political system as an input-output device as it were embedded in the wider social system; from the social system there flowed demands on the one hand and support on the other, and from the political system there flowed 'authoritatively allocated' values. Critics tended to complain not only that this was only a way of redescribing what everyone knew already, but that it misrepresented the nature of politics. Only in advanced modern societies was there a formal distinction between the realm of the political and that of the economic or the cultural, so this was not a picture of all forms of politics. Again, in some societies the political system is active rather than reactive, trying to mould the society rather than waiting to receive 'inputs'.

Almond's functional analyses of the political system were not entirely similar. In his account (*The Politics of the Developing Areas*, with James S. Coleman; *Comparative Politics Today*, with G. Bingham Powell) the political system must perform three output functions of 'rule-making, rule-enforcing and rule-adjudication', categories that bear perhaps too clear a resemblance to the three powers of the US legislature, executive and judiciary. Similarly, the 'input functions' of 'interest articulation' and 'interest aggregation' were sometimes derided as ornate synonyms for the work done by pressure groups and political parties in the USA. Enthusiasts for the approach responded by applying it to the then Soviet Union (David S. Lane, *Politics and Society in the USSR*) and employing it as a basis for the general theories of revolution (Chalmers Johnson, *Revolutionary Change*); unappeased critics continued to claim that such efforts showed that it was possible to restate the conventional wisdom in the new terminology, but not that there were new insights to be gained from its use.

What turned out to be intellectually unsatisfying and politically implausible were the unintended but hard to escape implications of the systems approach; that societies were 'naturally' orderly, that order was properly maintained by norms that integrated individuals into the social system, the selfishness required of economic actors would readily be held in check by altruistic and family-oriented norms, and more views of the same sort.

Systems theory was always criticized for its political deficiencies as much as its intellectual shortcomings. Among the complaints levelled at it, the best known were that it endorsed the US *status quo* by emphasizing the forces that made for social 'integration' and overlooking social conflict, that its adherents defined social and political development as a society's similarity to the USA, and that they removed the critical bite from democratic theory by elevating 'democratic stability' to the highest place among political values, at the expense of justice and equality. In general, it was widely argued the conflicts of interest and disparities of power were either ignored or made light of in the perspective so concerned to associate normality with stability.

3 Niklas Luhmann's systems theory

Just as the influence of Parsons' structural-functionalism began to wane in the USA, the German sociologist Niklas Luhmann emerged as the leading proponent of a new version of systems theory. Luhmann thought that the previous attempts to use systems theory in the social sciences applied cybernetic concepts too directly and suffered from the residual normative orientations of Durkheim and Parsons, which he, like structuralists and post-structuralists, denounced as so much 'old European humanism'. To be rigorous and consistent, systems theory had to drop all reference to actors and their self-interpretations, which were nothing but 'psychical systems' that form part of the environment for other systems. In this way, systems theory could replace the functionalist account of social integration through norms with the anonymous integration of interdependent parts and wholes and be generally applicable to every level of social analysis (Luhmann 1976).

Such a general and radical systems theory recognizes the fundamental fact of the large scale and complex forms of

social organization in modern societies, such as global markets and enormous bureaucracies, that work ‘behind the backs’ of social actors. Rather than being the product of intentional actions, such order is described in terms of functionally differentiated, yet interdependent, parts, whereby the internal operations of each maintain the system as a whole. Luhmann’s theoretical innovation was to emphasize how such social systems arise. Much like living organisms, social systems emerge through ‘autopoiesis’, that is, they are generated and maintained ‘exclusively’ by their own internal operations, and yet remain open to their environments. For Luhmann, systems are like Leibnizian monads, equipped with windows; ‘meaning’ is but one internal operation whose function is to reduce complexity, while ‘norms’ serve to restrict the possible operations of the system. Modern society can thus best be explained as a series of systems that have other systems as their environments, including law, the economy, organizations, science (including systems theory itself). Their internal complexity requires that they are externally related and do not form an overarching system.

According to Luhmann, systems may be formally defined in terms of their complexity. Although systems are always less complex than their environments, they must also constantly heighten their own complexity in order to adapt and remain stable. Once the inner-outer boundary is maintained and stabilized, a system becomes ‘operationally closed’, that is, it registers events in its environment only to the extent that they can be translated into its code and programming. This conception of ‘operational closure’ marks the most important difference between the theories of Luhmann and Parsons. Luhmann denies that modern societies are integrated in Parsons’ functionalist sense: there is no central or organizing system, whether state or society, but only the interdependencies between systems. In *Social Systems* (1984), Luhmann calls modern, highly complex and functionally differentiated societies ‘polycentric’, with no integrating centre or apex of power. As opposed to Parsons’ optimistic liberalism (1971), Luhmann sees democratic participation and control as an illusion in the face of overwhelming complexity and necessarily latent functional imperatives.

Luhmann does not limit his analysis to large scale social phenomena, but rather applies his systems theory to all levels of analysis, even to intimate relationships such as love. It is the lack of any restriction on the scope of such explanations that opens the theory to criticism, most thoroughly by Jürgen Habermas in his debate with Luhmann (1971). Luhmann’s analysis, according to Habermas, cannot recognize the coordinating effects of ordinary language communication within modern institutions. Such communication requires that actors are allowed back into social theory (Habermas 1970).

Habermas criticizes Luhmann’s systems theory on several levels. Theoretically, Habermas criticizes Luhmann for ignoring the continuing role of institutions, and thus of social integration, in ‘anchoring’ systemic mechanisms in the cultural life-worlds of their members. Because of the interaction of social and systemic integration, systemic mechanisms can have perverse effects, disrupting and ‘colonizing’ the domain of cultural reproduction. Methodologically, Habermas argues that action descriptions from the agents’ point of view remain a necessary condition for any social explanation. Normatively, Luhmann’s ‘methodological anti-humanism’ blinds the theory from the start to the possible influence of a society-wide and critical public sphere on complex, institutional processes.

Tagore, Rabindranath (1886-1941)

In the flurry of intellectual activity in nineteenth- and twentieth-century Bengal, Rabindranath Tagore became one of the best-known playwrights, poets, novelists, educators and philosophers, winning the Nobel Prize for literature in 1913. His thought drew on the English Romantics as well as Sanskrit and Bengali writers and movements.

Tagore was not a systematic philosopher. He termed his position 'a poet's religion' which valued imagination above reason. He moved between the personal warmth of human relationships to a theistic Divine and belief in an Absolute as a unifying principle. He advocated a thoughtful but active life, criticizing asceticism and ritualism.

Nineteenth- and twentieth-century Bengal witnessed a renewed flurry of intellectual activity as a response to the new Western presence in India. As a member of the 'Bengal renaissance', Rabindranath Tagore was both a prolific writer and an active educator. He left school aged fourteen, finding traditional education 'stifling', and in 1901 he founded a 'forest retreat' academy called Santiniketan which emphasized the arts and nature. In 1918 he founded Visvabharati, an international university promoting international understanding as well as Indian culture.

Tagore was brought up in a cosmopolitan home dominated by his father, Debendranath, who led a monotheistic and iconoclastic reform movement known as the Brahmo Samaj, founded in 1828 (see Brahmo Samaj). Debendranath was a religious and social reformer open to the ideas of the West. At home Rabindranath studied English, Sanskrit and Bengali literature and came to love the English Romantics Keats and Shelley, the classical Sanskrit writer Kālidāsa and the poetry of love for the Divine of the Bengali devotees of Kṛṣṇa, particularly the songs of the wandering singers known as the Bauls.

Although Tagore's writings reveal consistent themes and concerns, Tagore was not a systematic, philosophical thinker. He is best known for his plays, poetry, songs, essays and novels. He wrote his first poem at the age of eight. A collection of his devotional poems entitled *Gitanjali (Song Offerings)*, which he translated into English himself, brought him the Nobel Prize for literature in 1913. In four major religious-philosophical works, *Sādhanā: The Realization of Life* (1913), *Personality* (1917b), *Creative Unity* (1922) and *The Religion of Man* (1931), Tagore set forth his thought more fully. However, these are collections of essays and speeches: they are not solidly argued systematic treatises.

Tagore called his position 'a poet's religion', affirming that reality is best known through experience and emotion and that imagination is more important than reason (Sense perception, Indian views of). Reality is understood through recognition of the Absolute One behind the multiplicity, which is a 'creative principle of unity'. This means not only that the Divine is immanent in creation but that creation itself is a manifestation of the Divine. The world and its particulars are real because they are the Divine in playful manifestation. The underlying harmony and the inner interrelationship of each of the parts to the others is experienced as the expression of Divine joy and love. This affirmation of unity in Tagore's thought enabled contemporary Indian monists to read Tagore as a modern follower of Śaṇkara.

Tagore, however, rarely used the term 'Absolute' as he did not merely affirm an impersonal consciousness as the highest reality. Thus, early Western interpreters spoke of a Christian influence on Tagore. Besides the personal sense of the Divine he inherited through his father's Brahmo Samaj, his discovery at the age of fifteen of the love poems of the Bengali devotional movements, which sang of Kṛṣṇa and his loving relationship with his followers, was enough to redirect his understanding (see Gauḍīya Vaiṣṇavism). These poems provided inspiration both for Tagore's emphasis on the personal as the key to the universe and his philosophy of Divine joy and love. Ultimate reality, he believed, could not be divorced from personality; the Absolute is the supreme personality in intimate, personal and interdependent relationship with human beings. The Divine is not aloof, but involved with humanity. Their relationship of mutual love involves God's loving service for human wellbeing and the human response of realizing the infinite in the finite and becoming increasingly more united to the Divine.

The fullest expression of the Divine is in the human being. However, this does not mean that the individual does not exist as a separate entity, or that union with the Divine means absorption of the individual so as to lose its distinctive existence. Like the traditional philosophical position called *bhedābheda*, identity in difference, Tagore saw the human being as both identical with and different from the Divine. From what he describes as his first

religious experience at the age of eighteen, a vision lasting four days, he saw the personal as the central fact of the Divine-human-world relationship.

For Tagore, the poet, not the abstract philosopher, is the true seer. The poet reveals the Divine through song, paradox and aesthetic awareness. All art is the response of the soul to the Divine for it reveals beauty which is truth. Tagore defines beauty as the revelation of the harmony of the universe; conflict and chaos are the result of a limited vision which does not penetrate into the harmonious relationship of the whole but settles for usefulness and efficiency. Reason is limited to space and time, but the creative imagination found in all artistic endeavour connects humanity to the all and results in a response of active participation. Tagore, therefore, persistently criticizes the ascetic who flees from life as an escapist separated from the world. He also chides the religious devotee who is lost to the world in emotionalism. The traditional ascetic ideal, Tagore believed, would not further India's progress nor that of humanity. The active individual who transcends the egoistic desire for gain in the love of the Divine and its creation lives the good life. The poet stirs one to involvement in the world. The path to the realization of the Divine, *sādhanā*, includes all creative activity, which for Tagore was his writing, painting, composing and educating. 'Expression', he once wrote to a friend, 'is my religion'.

Taine, Hippolyte-Adolphe (1828-93)

Hippolyte Taine dominated the intellectual life of France in the second half of the nineteenth century. He was seen as the leader of the positivist, empiricist, anti-clerical forces in a period characterized by dramatic advances in science and technology and inspired by the hope that scientific method could be applied to human affairs. Yet at the heart of his life and work was the rationalist, essentialist imperative of Spinoza and of Hegel: to demonstrate the world as system, as necessity, to 'banish contingency'. The story of his life is the story of the abandonment of this project: it is a long, painful learning experience ending in the acceptance of loss; his richly varied works can be seen as the products of this philosophical journey.

Taine (born in Vouziers in the Ardennes) was the Sartre of his time. As withSartre, philosophy (more specifically, metaphysics) was the mainspring of all his work; but (again like Sartre) this work was variegated and popular and quite different from that of the philosophers - Spinoza, Hegel, J.S. Mill - who were his models. Most of Taine's writing was first published in newspapers and periodicals, such as *Le Journal des Débats* or *La Revue des Deux-Mondes*, before being revised, collected and published in book form.

He produced literary criticism (the various collections of essays and *La Fontaine et ses fables (La Fontaine and his fables)* (1861)); literary history (one of the first histories of English literature in any language); books of travel and social observation (the *Voyages* (Travels) and *Notes sur Paris* (1867)); and a monumental political and intellectual history of France, *Les Origines de la France contemporaine (The Origins of Contemporary France)* (1875-93). He also wrote an iconoclastic account of the *spiritualiste* philosophers of the preceding generation - Victor Cousin, Maine de Biran,Théodore Jouffroy - and published an influential work of psychological philosophy, *De l'Intelligence (On Intelligence)* (1870). The *Vie et Correspondance (Life and Letters)* (1902-7) is one of the great collections of the century and contains, besides remarkable letters, a great deal of crucial unpublished early material.

The published works give an appearance of dispersion and fail to reveal how fundamental the quest for philosophical unity was for him. There are two main reasons for this. First, like most thinkers of his time he was deeply attached to scientific observation, empirical reality, inductive method, experience - to what he called 'facts'. Throughout, he starts from the concrete - specific works of art or literature, historical records, psychological phenomena - the range is great but the underlying motivation is always philosophical in the sense of an urge towards the general and the abstract. The key is always the preface or the conclusion. Whether he acknowledges it or not, his aim is always a philosophy of art or literature, a philosophy of history, a philosophy of mind and, ultimately, a metaphysics. His aspiration, like Hegel's, is enyclopedic, and the apparently disparate parts of his investigation are aspects of an envisaged totality. In modern terms, Taine is a critical theorist and not a literary critic.

The second reason involves the process of reception, the way in which, during their lifetime and subsequently, writers are constructed, by themselves and others so as to be non-contradictory. In his twenties, as a consequence of his loss of religious faith, Taine was deeply concerned with metaphysics. A remarkable unpublished text, written in 1848, called 'De la Destinée humaine' (On Human Destiny) describes his loss of religious faith, his systematic doubt, and his salvation throughSpinoza and pantheism. Soon after, he learned German to read Hegel (then untranslated). His voluminous writings of this period remained unpublished during his lifetime and he himself progressively attenuated the expression of his metaphysical ambitions. Thus, by the end of his life, he was seen as a positivist and a pluralist. Only the publication of the *Life and Letters* and subsequent studies of unpublished material and variants revealed the underlying idealism, the persistent urge to refute Kant, Hume andMill, and the need to 'banish contingency'. For some critics he then became a sort of closet idealist; for many he was just confused and 'flawed'. Only recently has his work been seen as a dramatic struggle between competing forces.

Taine is representative not only because he was the public spokesman for the positivist, deterministic, anti-clerical, anti-Romantic aspects of his society, but because he lived the tensions and contradictions of that period and left a precise record. His writings can be read as a succession of attempts to square the circle, to demonstrate the world as system, as necessary, not accidental, or to show, as he put it, 'that philosophy was possible'. 'De la Destinée

humaine' is full of youthful optimism. But the sceptic grows stronger: Spinoza, he complains, 'destroys the world' and ignores Time. Hegel, whom Taine in many ways resembles, seemed to offer salvation: he writes in the *Philosophes français*, 'I read Hegel every day for a whole year. I will probably never again experience sensations like those he gave me' (1857: 126; author's translation). But Taine (who had not read the *Phenomenology of Spirit*) concludes by finding Hegel 'abstract', positing order a priori, but not proving it. He too 'destroys the world'.

Thereafter Taine's life is a series of attempts to succeed where Hegel failed; each time the goal seems less attainable; each effort is followed by a period of illness and depression. This rhythm continues even after he has renounced philosophy and become a historian: every re-edition of *On Intelligence* has a modified ending. By the final (4th) edition of 1883, Hegel's name has disappeared and Taine seems resigned to the loss of the Absolute. Sartre saw that the book was not an 'empiricism' as people had thought, but was in fact 'a realist metaphysics *manqué*'.

Taine does not have a 'philosophy'. His achievement is to have struggled throughout his life to reconcile an inherited rationalist desire for system with a scrupulous respect for concrete experience, to reconcile Spinoza and Hegel with Kant, Hume and Mill. The attempt ended in failure. The *Derniers essais* (1894) are suffused with a sense of wasted potential. But the story of this painful and honest coming to terms with loss over a lifetime's philosophical effort is dramatic and moving. It is also modern - and more characteristic of the lives of philosophers than is usually acknowledged.

List of works

Taine H.-A. (1857) *Les Philosophes français du XIXe siècle (French Philosophers of the Nineteenth Century)*, Paris: Hachette.(Iconoclastic account of previous generation of French philosophers.)

Taine H.-A. (1858) *Essais de critique et d'histoire (Critical and Historical Essays)*, Paris: Hachette.(The preface of this work is especially interesting.)

Taine H.-A. (1861) *La Fontaine et ses fables (La Fontaine and His Fables)*, Paris: Hachette. (Taine's doctoral thesis, written when a projected work on Hegel was declared unacceptable to the University.)

Taine H.-A. (1864) *Histoire de la littérature anglaise*, Paris: Hachette; trans H. Van Laun, *History of English Literature*, New York, Holt, 1872.(The introduction and the chapter on J.S. Mill are especially interesting.)

Taine H.-A. (1865a) *Philosophie de l'art*, Paris: Hachette; trans. J. Durand, *Lectures on Art*, New York, Holt, 1896.(A version of his lectures at the École des Beaux Arts, where he was Professor.)

Taine H.-A. (1865b) *Nouveaux essais de critique et d'histoire (New Critical and Historical Essays)*, Paris: Hachette.(Contains essays on Balzac, Marcus Aurelius and Racine.)

Taine H.-A. (1866) *Voyage en Italie*, Paris: Hachette; trans. J. Durand, *Italy*, 1870, 1871, New York, Holt.(Travel descriptions and personal responses to works of art.)

Taine H.-A. (1867) *Notes sur Paris, vie et opinions de M. Frédéric-Thomas Graindorge*, Paris: Hachette; trans. J.A. Stevens, *Notes on Paris*, New York, Holt, 1879.(In this work, Graindorge is a fictional American visitor to Paris.)

Taine H.-A. (1870) *De l'Intelligence*, Paris: Hachette; trans. T.D. Haye, *On Intelligence*, New York, Holt, 1899. (Taine revised each edition, changing especially the ending, to make the work less Hegelian.)

Taine H.-A. (1872) *Notes sur l'Angleterre*, Paris: Hachette; trans. W.F. Rae, *Notes on England*, New York, Holt. (Lively, detailed response to England and English society.)

Taine H.-A. (1875-93) *Les Origines de la France contemporaine*; trans. J. Durand, *The Origins of Contemporary France*, New York, Holt, 1885-94.(Taine's highly controversial history of France, designed as a 'medical consultation'.)

Taine H.-A. (1894) *Derniers essais de critique et d'histoire (Last Critical and Historical Essays)*, Paris: Hachette. (Contains moving, elegiac and confessional accounts of minor writers. The theme is '*Ubi sunt*'.)

Taine H.-A. (1902-7) *H. Taine, sa vie et sa correspondance*, Paris: Hachette, 4 vols; trans. R.L. Devonshire (vols 1 and 2) and E. Sparvel-Bayly (vol. 3. abridged), *Life and letters of H. Taine*, New York, Holt, 1902-8.(One of the great collections of the century. The editors made certain omissions, however, and the correspondence with Camille Selden was destroyed - see F. Léger below. Volume 1 contains extracts from 'De la Destinée humaine'.)

Tanabe Hajime (1885-1962)

Tanabe Hajime was a central figure of the so-called Kyoto School, and is generally acknowledged to be one of the most important philosophers of modern Japan. He held Kant in high esteem, and used a Neo-Kantian critical methodology in his early studies in epistemology. In the 1920s he was chiefly influenced by Nishida Kitarō's original cosmological system. He adapted Nishida's idea of 'absolute nothingness' to political situations and, in so doing, contributed much to establishing the foundations of what became the most influential philosophical school in Japan up until the end of the Second World War.

In 1919, Tanabe was appointed associate professor under Nishida Kitarō at Kyoto University. In 1927 he was promoted to full professor, replacing Nishida soon after. In 1945 he retired to Kitakaruizawa, Gunma-ken, and dedicated his later life to meditation and writing.

Under the influence of Nishida, Tanabe wished to develop his own cosmological system. This desire grew stronger during his stay in Germany from 1922 to 1924, where he studied under Edmund Husserl at Freiburg University and became friends with Martin Heidegger. Although he did not accept much of their phenomenological method, he was stimulated by Heidegger's intention to remodel phenomenology into a cosmology by assimilating existentialism. Returning to Japan, he began to turn his interpretation of Kantian philosophy into a systematic cosmology. The fruit of these efforts was his work *Kanto no Mokutekiron (Kant's Teleology)*, published in 1924, in which he characterized Kantian reflective judgement as the faculty of a comprehensive teleological world view (see Kant, I.).

Tanabe's attention then turned to dialectics. He held Hegelian dialectics to be just the logical method that could give concrete shape to a teleological comprehension of the world (see Hegel, G.W.F.). According to him, the formula 'thesis-antithesis- synthesis' represents the process through which teleologically driven objects gradually realize themselves. The final aim of the process indicates the teleological perfection of the world. To this he applied the term 'absolute nothingness', chiefly on the grounds that this term describes the activity of dialectical negation. Thus 'absolute nothingness' took on an active meaning in his understanding, where it had been originally used by Nishida in a meditative, introspective way. Tanabe described his steps to a thorough acceptance of dialectics in his work *Hegerutetsugaku to Benshoho (Hegel's Philosophy and Dialectics)* in 1932.

In 1934 Tanabe introduced a new notion, 'the logic of species', the novelty of which earned him a reputation as an original thinker. As he understood it, the triad of genus-species-individual was simply a variant of the triad of propositional logic, universal- particular-singular, as it is applied to human existence. In his logic of species, therefore, Tanabe was concerned with giving a new priority to the particular in human experience.

In its methodological structure, the logic of species was an attempt to apply dialectics to the real world. The individual is determined decisively by the species; conversely, the former seeks of its own free will to determine the latter. The two face each other as opposites in tension. Each is irrational and selfish in that each immediately affirms its own being, but through mutual interpenetration they can be purified of their irrational qualities and raised to the level of rationality. The resultant synthesis is the genus. Thus the individual and the species are synthesized in the genus; that is, a particular society is 'generalized'. Tanabe lumped together these results in the notion of the 'state'. The state as the realization of the universal had an important position in his thought. It was only natural for him to take the next steps towards a theory of the state, identifying the dialectical process with the perpetual self-renewal of the polity. Among his articles during this period, great importance can be attached to the one entitled 'Kokkatekisonzai no Ronri' (The Logic of National Existence), which appeared in 1939.

Tanabe's theory of the state was in its basic structure an admittedly rationalistic one. Pivoting on a dynamic in which ethnic unity is 'generalized' into rationality through the activity of free individuals, it offered the ideal of the nation-state. It was Tanabe's intention to give the Japanese state a rational, democratic basis; in this way, he set himself to check the irrationalistic, warlike modes of thinking. Obviously his efforts failed, chiefly due to the confusion of the ideal state with the real Japanese state. Tanabe watched as his own words were twisted by the nationalists into a justification for military aggression and, with pangs of conscience at this turn of events, his thinking came to a standstill.

After December 1941, Tanabe was no longer able to publish any philosophical work. It was only at the end of the war, with *Zangedo toshiteno Tetsugaku (Philosophy as Metanoetics)*, that his struggles bore fruit and released his thinking from its predicament. This work is often characterized as Tanabe's 'Confessions', for he described in it his experience of personal salvation. In despair over his philosophy up to that time, he had abandoned all attempts at realization under his own power and repented his errors. At this point he came to the awareness of returning to life by the grace of a transcendent Other-power. Since the new form of his philosophy was based on this experience, he named it 'metanoetics'. Thereafter he concentrated on religious thinking.

Tanabe then tried to reorganize his logic of species in light of the experience of metanoetic salvation. The particular society is 'generalized' through human action deriving ultimately from Other-power. This time, the resulting society is called not the state, but the religious community in its universal character. From here, Tanabe developed his interest in sociological research into the history of religions. In his notable work *Kirisutokyo no Bensho (Dialectic of Christianity)*, published in 1948, he explicated the development of primitive Christianity as typical of the way in which a religious community is founded. In his last years, he theorized on the bodhisattva-way of Mahāyāna Buddhism from the perspective of sociological philosophy of religion.

Tarski, Alfred (1901-83)

Alfred Tarski was a Polish mathematician and logician. He worked in metamathematics and semantics, set theory, algebra and the foundations of geometry. Some of his logical works, in particular his definition of truth, were also significant contributions to philosophy. He was a successful teacher and a master of writing simply and with great clarity about complicated matters.

Tarski was born Alfred Tajtelbaum in Warsaw. (The family name was changed in 1924.) Between 1918 and 1924 Tarski studied at the University of Warsaw where he received his doctorate in mathematics under the direction of S. Leśniewski. In 1926 he was appointed as a lecturer. In 1939 Tarski set out for a lecture tour of the USA and was prevented from returning to Poland by the outbreak of the Second World War. He then briefly held positions at Harvard University, the City College of New York and the Institute for Advanced Study at Princeton. In 1942 he was appointed to the mathematics department of the University of California at Berkeley, where he remained until his retirement in 1968.

Tarski's best known logical achievements, being also of philosophical significance, are certainly his definitions of satisfaction and truth and his work on logical consequence (see Tarski's definition of truth; Consequence, conceptions of). All Tarski's logical investigations were determined by his interests in the methodology of the deductive sciences, which he termed metamathematics. In fact, general metamathematics was one of his chief areas of activity. He distinguished three main types of deductive systems and studied their metamathematical properties - in particular, their axiomatizability, the independence of their axioms, and their consistency and completeness. Gradually, his metamathematical investigations took on an algebraic character, as reflected in his increasing emphasis on semantics. This approach led to the algebraic treatment of logic and the development of model theory, of which he was a founder and the author of various fundamental results.

Tarski's interest in model theory was connected to his studies on decidability. Here too his approach was fundamentally semantical and connected to matters of definability in theories. The key notion was that of interpretability, and Tarski developed general methods of proving (essential) undecidability of various theories (in particular, various algebraic and geometrical theories) by considering their interpretability in certain other theories. Another method used by Tarski in connection with the study of definability was that of quantifier elimination. It was also applied by Tarski to prove decidability of various theories (for example, of the theory of real closed fields).

Tarski used logical methods to study the foundations of various mathematical theories, in particular of geometry. Being interested mainly in Euclidean and general affine geometry he proposed various axiom systems for them and studied their metamathematical properties. Particularly prominent in Tarski's geometrical work was the problem of determining and selecting primitive notions. Connected with his work in geometry and set theory is the Banach-Tarski theorem, which is a remarkable consequence of the axiom of choice. It asserts that any sphere can be decomposed into a finite number of subsets which can be reassembled by rigid motions to form two spheres each having the same volume as the original. Tarski also proved that several statements of the arithmetic of the infinite cardinals are equivalent to the axiom of choice.

Tarski left few philosophical papers. Nevertheless, various parts of his logical work and, in particular, those concerned chiefly with the methodology of the deductive sciences and the nature of truth and consequence, are of considerable philosophical interest. He described himself as 'a mathematician (as well as a logician, perhaps a philosopher of a sort)'. It is difficult to characterize his philosophical views. He did, however, indicate that he believed logical and mathematical research ought not to be restricted by any general philosophical viewpoint.

ROMAN MURAWSKI

List of works

Tarski's bibliography comprises 109 papers, 94 abstracts and 20 monographs (some of them translated into several languages). Listed here are some of his works with the most importance for logic and philosophy.

Tarski, A. (1981) *The Collected Works of Alfred Tarski*, ed. S.R. Givant and R.N. McKenzie, Berkeley, CA: University of California Press, 4 vols.(Includes all Tarski's published works.)

Tarski, A. and Banach, S. (1924) ‘Sur la décomposition des ensembles de points en parties respectivement congruentes’ (On the Decomposition of Point-Sets into Mutually Congruent Parts), *Fundamenta Mathematicae* 6: 244-77.(Includes the Banach-Tarski theorem on the decomposition of the sphere.)

Tarski, A. (1930) ‘Fundamentale Begriffe der Methodologie der deduktiven Wissenschaften I’, *Monatshefte für Mathematik und Physik* 37: 361-404; trans. J.H. Woodger (1956), ‘Fundamental Concepts of the Methodology of Deductive Sciences’, in *Logic, Semantics, Metamathematics: Papers from 1923 to 1938*, ed. J. Corcoran, Indianapolis, IN: Hackett Publishing Company, 2nd edn, 1983, 60-109.(Introduces and investigates fundamental notions of the methodology of deductive sciences.)

Tarski, A. (1933) *Pojęcie prawdy w językach nauk dedukcyjnych*, Warsaw; trans. J.H. Woodger (1956), ‘The Concept of Truth in Formalized Languages’, in *Logic, Semantics, Metamathematics: Papers from 1923 to 1938*, ed. J. Corcoran, Indianapolis, IN: Hackett Publishing Company, 2nd edn, 1983, 152-278.(One of the most fundamental of Tarski’s works, including his famous definition of truth.)

Tarski, A. (1935) *O logice matematycznej i metodzie dedukcyjnej*, Lwów; trans. *Introduction to Logic and to the Methodology of Deductive Sciences*, Oxford and New York: Oxford University Press, 1941.(This book gives a general introduction, and shows how logic can be applied in the construction of mathematical theories.)

Tarski, A. (1944) ‘The Semantic Conception of Truth and the Foundations of Semantics’, *Philosophy and Phenomenological Research* 4: 341-75; repr. in L. Linsky (ed.) *Semantics and the Philosophy of Language*, Urbana, IL: University of Illinois Press, 1952.(Tarski’s definition of satisfaction and truth.)

Tarski, A. (1948) *A Decision Method for Elementary Algebra and Geometry*, prepared for publication by J.C.C. McKinsey, Santa Monica, CA: Rand.(One of the most important of Tarski’s results in decidability theory, namely the proof of decidability of the theory of reals.)

Tarski, A. (1949) *Cardinal Algebras*, Oxford and New York: Oxford University Press.(A monograph devoted to the algebra of cardinal numbers.)

Tarski, A., Mostowski, A. and Robinson, R.M. (1953) *Undecidable Theories*, Amsterdam: North Holland. (Includes three papers devoted to general methods of proving undecidability of theories, of various systems of arithmetic and of group theory.)

Tarski, A., Mostowski, A. and Robinson, R.M. (1956) *Logic, Semantics, Metamathematics: Papers from 1923 to 1938*, trans. and ed. J.H. Woodger, Oxford: Clarendon Press; repr. and ed. J. Corcoran, Indianapolis, IN: Hackett Publishing Company, 2nd edn, 1983.(Includes English translations of Tarski’s main logical papers from 1923 to 1938.)

Tarski, A., Mostowski, A. and Robinson, R.M. (1967) *The Completeness of Elementary Algebra and Geometry*, Paris: Institut Blaise Pascal.(The proof of the decidability of the theory of reals and of geometry.)

Tarski, A., Henkin, L. and Monk, J.D. (1971, 1985) *Cylindric Algebras*, Amsterdam: North Holland, 2 vols.(A monograph devoted to cylindric algebras.)

Tarski, A., Doner, J. and Mostowski, A. (1978) ‘The Elementary Theory of Well-Ordering - A Metamathematical Study’, in A. MacIntyre *et al*. (eds) *Logic Colloquium 77*, Amsterdam: North Holland, 1-54. (The proof of the decidability of the elementary theory of well-ordering.)

Tarski, A., Schwabhäuser, W. and Szmielew, W. (1983) *Metamathematische Methoden in der Geometrie*, Berlin and New York: Springer.(The development and metamathematical investigation of absolute and Euclidean geometry on the basis of a system of axioms introduced by Tarski.)

Tarski, A. and Givant, S. (1987) *A Formalization of Set Theory Without Variables*, Providence, RI: American Mathematical Society.(A demonstration that set theory and number theory can be developed within the framework of a new, different and simple equational formalism, closely related to the formalism of the theory of relational algebras.)

Tarski's definition of truth

Alfred Tarski's definition of truth is unlike any that philosophers have given in their long struggle to understand the concept of truth. Tarski's definition is more clear and precise than any previous definition, but it is also unusual in character and more restricted in scope. Tarski does not provide a general definition of truth. He provides instead a method of constructing, for a range of formalized languages L, definitions of the notions 'true sentence of L'. A remarkable feature of Tarski's work on truth is his 'Criterion T', which lays down a general condition that any definition of 'true sentence of L' must satisfy. Tarski's ideas have exercised an enormous influence in philosophy. They have played an important role in the formulation and defence of a range of views in logic, semantics and metaphysics.

1 Formal correctness and material adequacy

Any definition that aims to elucidate some aspect of a concept must satisfy two sets of requirements: the definition must be, in Tarski's terminology, 'formally correct' and 'materially adequate'. Under formal correctness fall requirements concerning the form of the definition and the vocabulary that the definition may use. Concerning these requirements, let us note only that a definition of 'true' of the form

x is true iff *x*

is bound to be formally correct provided that the right-hand side of the equivalence contains only 'admissible' vocabulary, that is, vocabulary that may legitimately be used in defining 'true'. For example, the definition

x is true iff *x* corresponds to reality

fails to satisfy the requirement of formal correctness, because the terms 'corresponds' and 'reality' are much too unclear to be considered admissible. On the other hand, no doubts should arise about the formal correctness of the definition

x is true iff *x* is identical to *x*.

The definition is, of course, unsatisfactory. But that is because it is materially inadequate: it fails to conform to our ordinary notion of truth.

The most remarkable feature of Tarski's work on truth (1936, 1944) is his formulation, known as 'Criterion T', of the requirement of material adequacy. It is this Criterion that is responsible for the special characteristics, both positive and negative, of Tarski's definition. On the positive side, it enables Tarski to give a precise definition of truth and to prove its material adequacy. On the negative side, it is the source of the unusual and, from the philosophical point of view, strange character of Tarski's definition.

Criterion T lays down two conditions that a materially adequate definition of truth must meet. The second, and less important, condition is that the definition should imply that only sentences are true. Tarski imposes this condition because he takes truth to be a predicate of sentences. The first, and more important, condition is that the definition should imply all the 'T-biconditionals', that is, all sentences of the form

(T) '' is a true sentence (of English) iff .

Thus, Criterion T requires that a definition of truth (for English) should imply, for example, the famous T-biconditional,

'Snow is white' is a true sentence (of English) iff snow is white.

Note that any definition that implies this biconditional is bound to define a concept that agrees with truth over the sentence 'Snow is white': the sentence will fall under the concept if and only if it falls under truth. Hence, any definition that implies *all* the T-biconditionals is bound to define a concept *C* that agrees with truth over all the sentences: the concept defined is bound to be coextensive with truth (assuming that truth and *C* agree over non-sentences). Furthermore, since this argument uses no special contingent assumptions, the claim of

coextensiveness holds irrespective of the contingent facts. In one sense of 'intension', then, the concept defined is bound to have the same intension as truth.

The equivalence of the two sides of the T-biconditionals has been noted by many philosophers and logicians, including Aristotle, Gottlob Frege and Frank Ramsey. Tarski is the first, however, to have used the equivalence to formulate a material adequacy condition on a definition of truth. The simplicity of Tarski's formulation should not obscure the important and surprising claim that it contains. Definitions of virtually all of our concepts can be assessed for material adequacy only in a piecemeal way, namely, by comparing their consequences with the ordinary uses of the concepts defined. No general conditions of material adequacy can be laid down. One would have expected the same of truth. But Criterion T puts forward a general and a priori condition of material adequacy on a definition of truth - a condition that, surprisingly, is highly plausible. Criterion T embodies Tarski's key philosophical claim. If it is granted then there can be no denying that it marks an important philosophical advance.

The formulation of Criterion T given above, it must be acknowledged, is unsatisfactory in several respects. First, it is formulated only for a definition of truth *for* English *in* English. What is wanted - and what Tarski's works provide - is a more general criterion that also applies to other languages. Second, the criterion as formulated is plausible only for sentences that are free of ambiguity, indexicals, tenses and other context-dependent elements. Tarski himself never attempted to overcome this limitation - his primary interest was in formalized languages for which these problems do not arise - but other philosophers have attempted to do so. Third, and most important, the criterion as formulated requires the definition of truth to be inconsistent. This inconsistency is a consequence of the liar paradox.

2 The liar paradox

Suppose, following Saul Kripke, that we introduce a name 'Jack' into English with the understanding that it names the sentence 'Jack is not a true sentence (of English)'. Suppressing the parenthetical relativization, the T-biconditional for Jack is

'Jack is not a true sentence' is a true sentence iff Jack is not a true sentence.

Our stipulation ensures that

Jack = 'Jack is not a true sentence'.

Hence, by the principle of substitutivity of identicals, the T-biconditional for Jack implies

Jack is a true sentence iff Jack is not a true sentence.

This in turn yields a contradiction by the rules of propositional logic. Note that the difficulty cannot be overcome by stipulating away names such as 'Jack'. Self-referential 'liar' sentences, which yield an inconsistency, can be constructed without the aid of such names.

Tarski makes constructive use of the argument of the liar paradox. He uses it to prove (a version of) the indefinability theorem named after him: arithmetical truth is not arithmetical. More precisely, no formula of Peano arithmetic (PA) is true precisely of (the codes of) the true sentences of PA (see Gödel's theorems). The theorem has a more general version: no classical language L_1 that is rich in syntactic resources can contain its own notion of truth. L_1 can be extended to a new language L_2 by the addition of a predicate that represents 'true in L_1'. But, by Tarski's theorem, L_2 will not contain its own truth predicate. As before, L_2 can be extended to yet another language L_3; this will contain a truth predicate for L_2, but again not for L_3. By repeating this procedure, we obtain a Tarskian hierarchy of languages, $L_1, L_2, \ldots, L_n, \ldots$, in which truth for a language of level *n* is contained in the language at level $n + 1$. 'Tarski's indefinability theorem' motivates a way of getting around the difficulty that the paradoxes pose for Criterion T: (1) Draw a distinction between the language *in* which the definition of truth is given (the 'metalanguage') and the language *for* which the definition is given (the 'object language'); and (2) require that the object language not contain its own notion of truth. This manoeuvre ensures that no liar sentences occur in the object language. Consequently, the threat of inconsistency is removed from the T-biconditionals, and we regain Criterion T as a plausible material adequacy condition.

The manoeuvre allows us to proceed with the definition of truth for certain kinds of languages. But it does not help

us to understand the behaviour of truth in languages (such as English) that contain paradoxical sentences. Tarski's response to this problem was an impatient one: he dismissed all such languages as inconsistent. In the past twenty-five years or so, however, Tarskian ideas have been used to develop a better, and certainly less impatient, response to the problem. The response that is most Tarskian in spirit is the 'hierarchy theory' of Charles Parsons and Tyler Burge. This theory sees our ordinary notion of truth as implicitly hierarchical. Each occurrence of 'true', according to the theory, corresponds to a truth predicate at a certain level in Tarski's hierarchy - with different occurrences corresponding to predicates at possibly different levels. So, for example, in the sentence

'''Snow is white'' is true' is true.

the first occurrence of 'true' might correspond to the truth predicate at the first level of the hierarchy, and the second occurrence to that at the second level. The substantial burden on a hierarchy theory is to give a systematic explanation of the levels of the occurrences of 'true'. There are other approaches to the paradoxes that build on Tarski's ideas. The principal ones are the 'fixed-point theory' (see Semantic paradoxes and theories of truth §4) and the 'revision theory' (see Definition §4).

Tarski showed how to construct definitions of truth that meet Criterion T. The next section contains some examples of Tarskian truth definitions. But before turning to these, let us note some general features of Tarski's method. First, this method does not yield a definition of the relational notion 'true in *L*', with variable *L*; its primary application is to the definition of 'true in *L*' for particular *L*. Second, the method enables us to give truth definitions only for formalized languages, not for natural languages. Third, it yields a definition in a metalanguage *ML* that is distinct from the object language *L*. If *ML* is a classical language then the distinction is forced by Tarski's indefinability theorem.

3 Examples of Tarskian truth definitions

This section gives three examples of Tarskian truth definitions. Two of these are very simple; only the third begins to approach the complexity of Tarski's actual definition.

Example A. Suppose that *L* is a fragment of English that contains only a finite number of sentences (say, a million). Suppose that the sentences of *L* contain no occurrence of 'true' or of any other term whose use is inadmissible in a definition of truth. Further, let 'S_1', 'S_2', . . . , 'S_{10^6}' be abbreviations of the sentences of *L*. A definition of 'true sentence of *L*' may now be given as follows:

x is a true sentence of *L* iff S_1 and *x* is 'S_1', or S_2 and *x* is 'S_2', or…, or S_{10^6} and *x* is 'S_{10^6}'.

The definition is evidently formally correct. Apart from the vocabulary of $S_1, S_2, \ldots, S_{10^6}$, which is stipulated to be admissible, it uses only the logical notions 'or' and 'is' (identity) and the quotation names for the sentences of *L*. The definition is also materially adequate since, under the assumption of such simple syntactic facts as 'S_1' is not 'S_2', it implies all instances of the form (T).

Example B. Let us now construct a definition of truth for a language L' that has an infinite number of sentences. Suppose that L' has two sentential connectives, '$\sim$' (negation: 'it is not the case that') and 'Čamp;' (conjunction: 'and'). Suppose further that L' has a finite number of atomic sentences, that is, sentences that are not built using the connectives '$\sim$' and 'Čamp;'. Now truth for atomic sentences can be defined as in example A. Over compound sentences, truth can be defined recursively: the negation of a sentence *A* is true iff *A* is not true; a conjunction is true iff both its conjuncts are true. Putting these elements together we can construct an explicit definition of 'true sentence of L'' in the following way. First let us define an intermediary notion, that of a 'closed' set; this will enable us to give a more compact definition of truth. A set *Z* is 'closed' iff (1) *Z* contains all true, and only true, atomic sentences of L'; (2) *Z* contains the negation of a sentence *A* iff it does not contain *A*; and (3) *Z* contains the conjunction of sentences *A* and *B* iff it contains the conjuncts *A* and *B*.

x is a true sentence of L' iff *x* belongs to every closed set.

Assuming that the atomic sentences of L' do not contain any terms that are inadmissible, our definition is formally correct. Further, it is materially adequate, since it implies all the T-biconditionals of L'. Note that the implication requires some syntactic facts about L' and some low-level set-theoretic facts.

Example C. Finally, let us see how to construct a definition of truth for a quantificational language L''. Such a language has an infinite number of sentences, so the definition of truth cannot proceed in the list-like way of example A; it relies instead on a recursion. However, in these languages compound sentences may have immediate components that are not themselves sentences. For example, the quantificational compound '$(\forall v)Red(v)$' ('Everything is red') has as its immediate component '$Red(v)$', which is not a sentence. Consequently, in these languages, the truth of compounds cannot in general be explained recursively in terms of the truth of their components. To solve the problem Tarski first defines recursively a more general notion, namely, 'satisfaction', and then he defines truth using satisfaction.

Satisfaction is a relation that holds between 'assignments' (of values to variables) and formulas. We can think of assignments as functions from variables into objects. So, if *s* is an assignment and *v* is a variable then $s(v)$ is the value *s* assigns to *v*. Intuitively, an assignment *s* satisfies a formula *A* iff *A* is true when the free variables in it are interpreted as naming the values that *s* assigns them. The notion of satisfaction is easy to define for atomic formulas: any assignment that assigns a red object to the variable *v* satisfies the formula '$Red(v)$'. Similarly, any assignment *s* such that $s(v)$ is larger than $s(w)$ satisfies the formula '$Larger(v, w)$'. The clauses for *n*-ary predications are analogous. Satisfaction for complex formulas is defined recursively in terms of the satisfaction of the components:

An assignment *s* satisfies the negation of a formula *A* iff *s* does not satisfy *A*.
An assignment *s* satisfies the conjunction of *B* and *C* iff *s* satisfies *B* and *s* satisfies *C*.
An assignment *s* satisfies the universal quantification of *A* with respect to the variable *v* iff *A* is satisfied by all assignments s' such that for all variables v' distinct from *v*, $s'(v') = s(v')$.

This recursive explanation can be converted to an explicit definition of satisfaction (see example B). It is easy to show that the satisfaction of a formula *A* by an assignment *s* depends only on the values that *s* assigns to the free variables of *A*. Consequently, a sentence is satisfied either by all assignments or by none. This motivates the following definition of truth:

x is a true sentence of L'' iff *x* is a sentence of L'' that is satisfied by all assignments.

The reader will find a more leisurely presentation of this example in W.V. Quine's *Philosophy of Logic* (1970).

4 Philosophical influence

Tarski's avowed aim in constructing a definition of truth was to lay down the foundations of a scientific semantics, and it is here that his work has been most influential. Tarski's work provides the foundations for a semantic study of logic - a study that has been vigorously pursued in the twentieth century and to which Tarski made important contributions. Two key notions in this study - 'model' and 'truth in a model' - are generalizations of the notions of 'assignment' and 'satisfaction' introduced in example C. An assignment specifies the values of the variables; a model specifies the domain of quantification and the 'values' of all the nonlogical constants in the language. Furthermore, just as satisfaction tells us what formulas are true under what assignments, similarly 'truth in a model' tells us what formulas are true when the quantifiers and the nonlogical constants are interpreted as specified in the model. The notions 'model' and 'truth in a model' enable a semantic explanation of the various logical notions. For example, an argument is 'valid' if and only if its conclusion is true in all models in which all the premises are true. The semantic analysis of logical concepts has yielded valuable insights into logic (see Model theory).

Tarski's definition of truth is also of importance in natural-language semantics. Here it has inspired two different kinds of approaches: the Davidsonian approach and the model-theoretic approach. The Davidsonian approach takes the goal of a semantic theory for a language *L* to be the construction of a theory of truth for it: a finite theory that implies all the T-biconditionals of *L*. (This is only a rough characterization; see Meaning and truth.) Davidson has argued that such a theory must proceed recursively, explaining semantic properties of compounds in terms of the semantic properties of the components. As a result, the theory will reveal the logical structure of language. The model-theoretic approach, developed by Richard Montague and others, takes the goal of the semantic theory to be the definition of the notion 'truth in a model'. This requires the characterization of the notion of model and it, in turn, requires an analysis of the logical structure of language. Davidson's work has been highly influential in

philosophy, but less so in linguistics. The model-theoretic approach has, however, gained many adherents in linguistics.

Tarski gave his definition in a philosophical climate that was sceptical of the notion of truth. Some logical positivists suggested, for example, that the notion was unanalysable in empirical terms and, hence, unacceptable in a scientific philosophy. Tarski's definition provided a decisive refutation of their suggestion. Let *L* be the positivists' language - purified of all elements that the positivists judge to be unempirical and meaningless. The notion 'true in *L*', Tarski showed, can be rigorously defined using only resources that the positivists would accept: the definition uses only some syntactic and logical concepts and those that are expressed in *L*. Tarski's results were accepted by the positivists and significantly influenced their philosophical work (especially that of Rudolf Carnap).

Tarski's definition has also been influential in more recent philosophy. Some philosophers (for example, Hartry Field (1972) and Michael Devitt) have sought to construct a correspondence theory of truth on its basis. These philosophers accept the recursive parts of Tarski's definition. But they argue that the definition does not provide a substantial account of the semantic properties of the simplest elements of the language. It does not explain, for example, when a name denotes an object or when an object falls under a predicate. To obtain a fully fledged correspondence theory, they suggest, Tarski's recursive explanation of truth should be supplemented with a substantial account of the semantics of the simples. Some philosophers have seen in this kind of theory a way of vindicating realism. But others have questioned both the feasibility of the theory and its links to the realism issue.

It is ironic that while Tarski put forward his definition to show that the concept of truth is useful for certain logical and philosophical purposes, his ideas have also been used in defence of 'deflationism' - the view that the concept has no substantive role to play in logic and philosophy. The thought here is that something like Tarski's definition explains completely the meaning of 'true', and that this makes truth a philosophically lightweight concept. Hence, it is claimed, the concept can play no substantive role in, for example, the explanation of validity or the realism debate. Consider, for instance, the explanation of validity - say, of the argument *P*, therefore *Q* - in terms of truth: the argument is valid iff it is impossible that *P* be true but *Q* false. The T-biconditionals, the deflationists argue, reduce this explanation to the nearly vacuous claim that the argument is valid iff it is impossible that *P* and not *Q*. Neither the explanation nor the concept of truth seem to be doing any substantive work.

The role of the concept of truth in philosophy continues to be a topic of intense debate. In this debate, Tarski's definition and Tarski's ideas occupy centre stage.

Tauler, John (*c.*1300-1361)

Tauler was a Dominican preacher and mystic, the author of seventy-nine vernacular sermons which presented the Neoplatonic speculative mysticism of his teacher Eckhart in more personal and concrete terms. Tauler greatly influenced late medieval mendicant spirituality, Luther, and the German pietists and romantics. His primary aims were to inculcate the spiritual virtues and devotion to God.

Tauler, his friend Henry Suso and Meister Eckhart are the central figures in the Rhineland school of mysticism. Tauler enrolled in the Dominican *studium generale* in Cologne in 1324, together with Suso, but little is known of a life devoted to preaching and spiritual direction in the Dominican nunneries and Beguines around Strasbourg and Basel. Among Tauler's spiritual contacts were Suso, who was like Tauler also a leader of and moderating influence on the Friends of God who were inclined to antinomian spirituality, the influential mystical Dominican nun Margareta Ebner and the famous Rhenish mystic John Ruusbroec.

The social situation during Tauler's maturity was chaotic. The Strasbourg Dominicans were exiled in Basel (1339-43) during the time the anti-papal civic authorities supported Emperor Louis. The ensuing civil war and the Black Death strained conventional morality, creating a challenge for a preacher calling lay people to the spiritual life. These conditions may have contributed to the ferocity and intense gloom of some of the sermons. In any case, Tauler's sermons are more personal and emotional than Eckhart's but generally more moderate and balanced than Suso's. At his death Tauler had published nothing; the sermons were written down in the Middle High German vernacular by listeners who were most often Dominican nuns.

Tauler's sermons combine biblical commentary with German mystical themes, supplemented by distinctions drawn from scholastic thinkers, especially Peter Lombard and Thomas Aquinas. They orient pastoral concern towards spiritual transformation, and combine various strands of medieval Christian mysticism: practical monastic spirituality, Dominican intellectualist mysticism, and beatitude and divinisation. Philosophically, Tauler was most influenced by the Neoplatonised Aristotelianism of Albert the Great and the stronger Neoplatonism of Pseudo-dionysius and Meister Eckhart. Notably absent from the sermons is the love imagery prominent in medieval exponents of *Song of Songs* mysticism. Tauler is deeply versed in Eckhart's teachings; thus, he regularly employs the themes and concepts of Dominican mystical psychology, though his language is usually more concrete. Fundamental are the notions of 'the ground', 'summit' or 'spark' of the soul, the mysterious essence of human nature that can touch the ineffable divine nature, the 'imageless Image' which is the Trinity. Paradoxically, however, the soul returns to God by returning to itself: 'This spark flies up to the summits where its true place is, even beyond this world, where intelligence cannot follow it, for it does not rest until it returns to that centre from which it originates and where it used to be in its uncreated state' (Sermons 64, 2). Clearly, Tauler suscribes to the 'breakthrough' (*Durchbruch*) of the soul into eternity, but unlike Eckhart, he favours an account of divinization consistent with the orthodox distinction between God and creature. This and other departures from his teacher's extreme views should be understood in part as precautions against the ecclesiastical pressures increased by Eckhart's condemnation in 1328.

Negative theology becomes a supple psychological instrument in Tauler's hands (see Negative theology). Instead of emphasising Eckhart's heterodox notion of the soul's birth as the Son, Tauler counsels humility, self-denial and detachment (*Gelassenheit*) - also Eckhartian themes. Meditative concentration on the humanity of Christ entails for Tauler the negation of overly abstract theological concepts and the abandonment of free will, external goods and attachments, as in Matthew 19: 29: 'whoever leaves father and mother and all possessions for my sake shall receive a hundredfold and eternal life'. Tauler's own words serve well as the motto of this more homely, devotional spirituality: 'The lower the descent, the higher the ascent'. Like Suso, Tauler is more inclined than Eckhart to explain human error and sin and their overcoming through ascetic exercises and the sacraments. Unlike his friend, however, Tauler does not speak explicitly of his own spiritual experiences. Paradigmatic stages of the spiritual life are explored via scriptural exegesis. Instead of Suso's imaginative flights Tauler employs vivid imagery drawn from common life, crafts and popular examples to convey abstract points. His overall aim is to strike a balance between the aridity of scholastic theology and the excesses of pseudo-mystical enthusiasm, with its widespread dangers of mistaking inner spiritual freedom with libertinism.

Taxonomy

The fundamental elements of any classification are its theoretical commitments, basic units and the criteria for ordering these basic units into a classification. Two fundamentally different sorts of classification are those that reflect structural organization and those that are systematically related to historical development.

In biological classification, evolution supplies the theoretical orientation. The goal is to make the basic units of classification (taxonomic species) identical to the basic units of biological evolution (evolutionary species). The principle of order is supplied by phylogeny. Species splitting successively through time produce a phylogenetic tree. The primary goal of taxonomy since Darwin has been to reflect these successive splittings in a hierarchical classification made up of species, genera, families, and so on.

The major point of contention in taxonomy is epistemological. A recurrent complaint against classifications that attempt to reflect phylogeny is that phylogeny cannot be 'known' with certainty sufficient to warrant using it as the object of classification. Instead, small but persistent groups of taxonomists have insisted that classifications be more 'operational'. Instead of attempting to reflect something as difficult to infer as phylogeny, advocates of this position contend that systematists should stick more closely to observational reality.

1 The goals of taxonomy

Any set of entities can be classified in indefinitely many ways. Books can be classified according to author, title, subject matter, and so on. Although these various classifications can be integrated into a single reference system so that any book can be retrieved on a variety of different counts, books as physical objects can be arrayed on library shelves in only one order. Even here, contingent problems arise. For example, very large books may have to be shelved out of order, and expensive first editions may be locked away in separate collections.

More stringent requirements apply to scientific classifications. The ultimate goal for scientific classifications is to group entities so that these classes function in, or facilitate the formation of, scientific laws (see Laws, natural §1). Aristotle divided motion into super- and sub-lunar as well as forced and natural (see Mechanics, Aristotelian). The primary justification of his classification was the system of laws that he was able to generate using it. When Newton introduced his quite different system, his classification replaced Aristotle's because Newton's system of laws was more powerful, accurate and inclusive. In general, systems of scientific classification are intimately connected to scientific theories and cannot be evaluated independently of them. Different sorts of theories require different classifications.

One major difference is between structural and historical classifications. The periodic table of physical elements is structural. The elements are individuated and ordered linearly according to their atomic number. Hydrogen comes first, then helium, lithium, and so on. These elements in turn can be arranged hierarchically as metals, rare earths, and so on. Some of these arrangements are perfectly nested; others are not. A more contemporary classification would include reference to subatomic particles and their relations (see Chemistry, philosophical aspects of §4). In general, structural hierarchies do not include very many levels. They are not very deep. Although cosmology is a legitimate area of physics, no one has suggested a historical classification of the physical elements; for example, classifying them in the order in which they appeared after the Big Bang.

Historical classifications are more prominent in other areas of scientific investigation. For example, linguists produce both structural and historical classifications of languages. Phonemes are the basic units of the structural classifications. Historical linguists also reconstruct the history of languages, indicating which evolved from which and how various sounds changed through time. One sign that a classification is historical rather than structural is the number of levels it exhibits. Historical classifications tend to be much deeper than structural classifications.

The logical structure of structural classifications is quite intuitive. Geometric figures can be divided into those that have three, four, five, and more sides. Three-sided figures in turn can be divided into triangles that have three, two and no sides of equal length. The logical structure of historical classifications also appears to be intuitively clear. It is anything but. Appearances notwithstanding, historical relations, especially those that form genealogical trees, are not easily represented in hierarchical classifications. Because these issues have been worked out most extensively with respect to classifications of living creatures, and because biological classifications are among the

most familiar, the rest of this discussion concentrates on biological classifications.

2 The basic units of classification

The organisms with which people are most familiar seem to fall naturally into discrete kinds. No one has any trouble telling apart cats, dogs, elephants and whales. However, this ease stems from limitation of perspective. If a particular species is followed across its range, problems frequently arise as the traits that characterize the species change geographically. Populations of a species in one locale frequently differ statistically from populations at other locales. If biological species are traced through successive geological strata, the same sort of variation occurs. In addition, not all organisms seem to form species of the same sort. For example, organisms that reproduce sexually may well form species that are significantly different from the species formed by organisms that reproduce asexually. Plant species may differ systematically from animal or protist species. For example, hybrid species are rare among animals but common among plants.

Most systematists are willing to put up with these difficulties in order to produce classifications that reflect the evolutionary process. Others, however, have suggested subdividing organisms into basic units of the sort that can be recognized with greater ease and reliability. For example, the basic units of classification might reflect some one measure of overall similarity. One of the problems with this suggestion is deciding on the measure. Another is that, no matter the measure, many of the resulting ‘species’ are exceedingly nonstandard; for example, males and females of the same evolutionary species may be placed in separate ‘species’. Still other systematists have proposed to define species so that males, females and their immediate descendants are included in the same species, but thereafter all that is required is one or more diagnostic characters. Species can be defined in numerous different ways for different purposes, but systematists must settle on a single way for their classifications (see Species §1).

3 Homology and monophyly

For centuries systematists attempted to produce structural classifications of living creatures. At times, they thought that they had found criteria that promised to group organisms into something like the periodic table, but insuperable problems always arose. Living creatures seemed to embody two different kinds of similarity. As much as sharks, boney fishes and whales look alike on the basis of some characteristics, they are fundamentally different on other sets. With the introduction of Darwin’s theory of evolution, systematists realized why they were having such a difficult time. Biological kinds (taxa) are characterized by both structural and historical relations, and no one classification can represent both (see Darwin, C.R.; Evolution, theory of).

Nothing requires systematists to accept descent as the relation that they represent in their classifications. If some other principle of order had proven feasible and productive, it might have been adopted. But once systematists accepted the task of constructing classifications that reflect genealogy, they had to rework their basic conceptual system from the ground up, redefining terms that had no genealogical component so that they did. For example, the terms ‘homology’ and ‘analogy’ originally implied nothing about descent but concerned differences in structural patterns. Evolutionists redefined these terms to indicate descent. Apes, fish and amphibians all have eyes, and these eyes are homologies because they evolved as eyes in a common ancestor. They are vertebrate eyes. Cephelapods also have eyes, but these ‘eyes’ cannot count as the same character as vertebrate eyes because they evolved independently. Similarly, snakes belong to Tetrapoda even though they have lost their legs. Having lost a character is importantly different from never having possessed it in the first place.

According to evolutionary systematists, all taxa must be monophyletic. However, some systematists are satisfied with a weak notion of monophyly, while others insist on a much stronger notion. On the weak definition, all species that make up a monophyletic taxon must arise from a single immediately ancestral stem species. Willi Hennig and his intellectual descendants (termed ‘cladists’) are convinced that a much stronger notion of monophyly is required. Not only must all species included in a monophyletic taxon be descended from a single stem species, but also all the species descended from a single stem species must be included in a single higher taxon. One problem with this stronger definition of ‘monophyly’ is that it obliterates numerous time-honoured taxa. For example, Reptilia has been part of biological classifications for centuries. However, Reptilia is not monophyletic in this stronger sense because some organisms that share an immediate common ancestor with reptiles are nevertheless not included in Reptilia, for example, birds.

4 Taxonomic hierarchies

Because phylogenetic trees consist of successive branches and hierarchical classifications consist of successively less inclusive taxa, systematists were led for a long time into thinking that the relationship between the two systems is quite straightforward. It is not. The source of this mistake can be seen in Figure 1(A), which represents a typical phylogeny. The intuitive classification of this phylogeny is presented in Figure 1(B). A moment's reflection should reveal that something is wrong with this classification. The phylogenetic tree is made up of five species, while the classification lists only two species. The taxon listed as Tribe *a* is not a Tribe but a species.

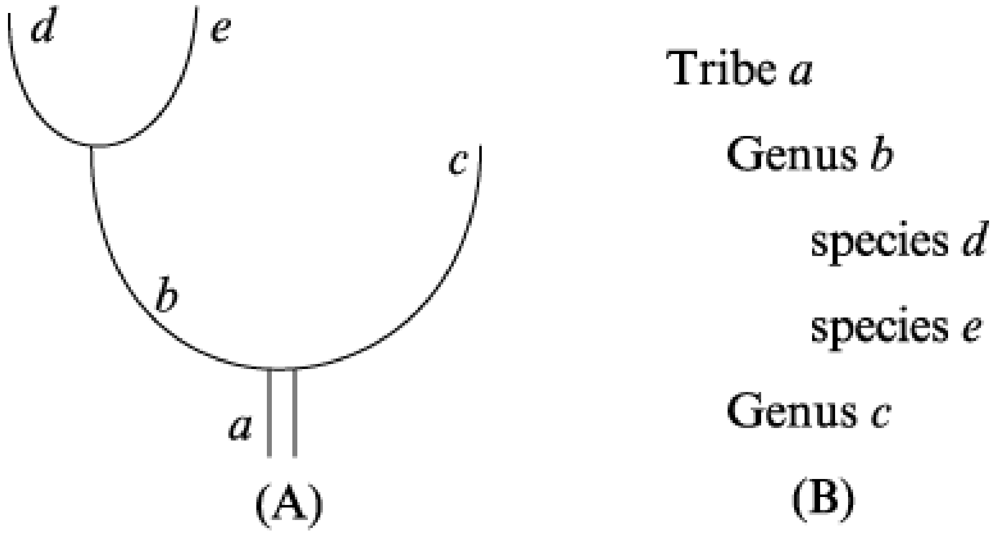

Figure 1. A representative phylogeny (A) and an intuitive but mistaken way of classifying it (B)

A more appropriate classification of the phylogeny depicted in Figure 1(A) is presented in Figure 2(A). The way in which this classification groups species into higher taxa is represented in Figure 2(B). In this classification, the five species are at least listed as species. However, problems remain. All the taxa in this classification are monophyletic in the weak sense. Each stems from a single ancestral species. But not all of these taxa are monophyletic in the stronger sense. The source of the problem is, surprisingly, the presence of common ancestors. No collection of species that includes one or more species that are ancestral to the others can be classified monophyletically in the strong sense. If species *a* in Figure 1(A) is classified with species *b*, then species *c* is left out. Conversely, if species *a* is classified with species *c*, then species *b* is left out. As a result, no classification that includes common ancestors can be monophyletic in the strong sense.

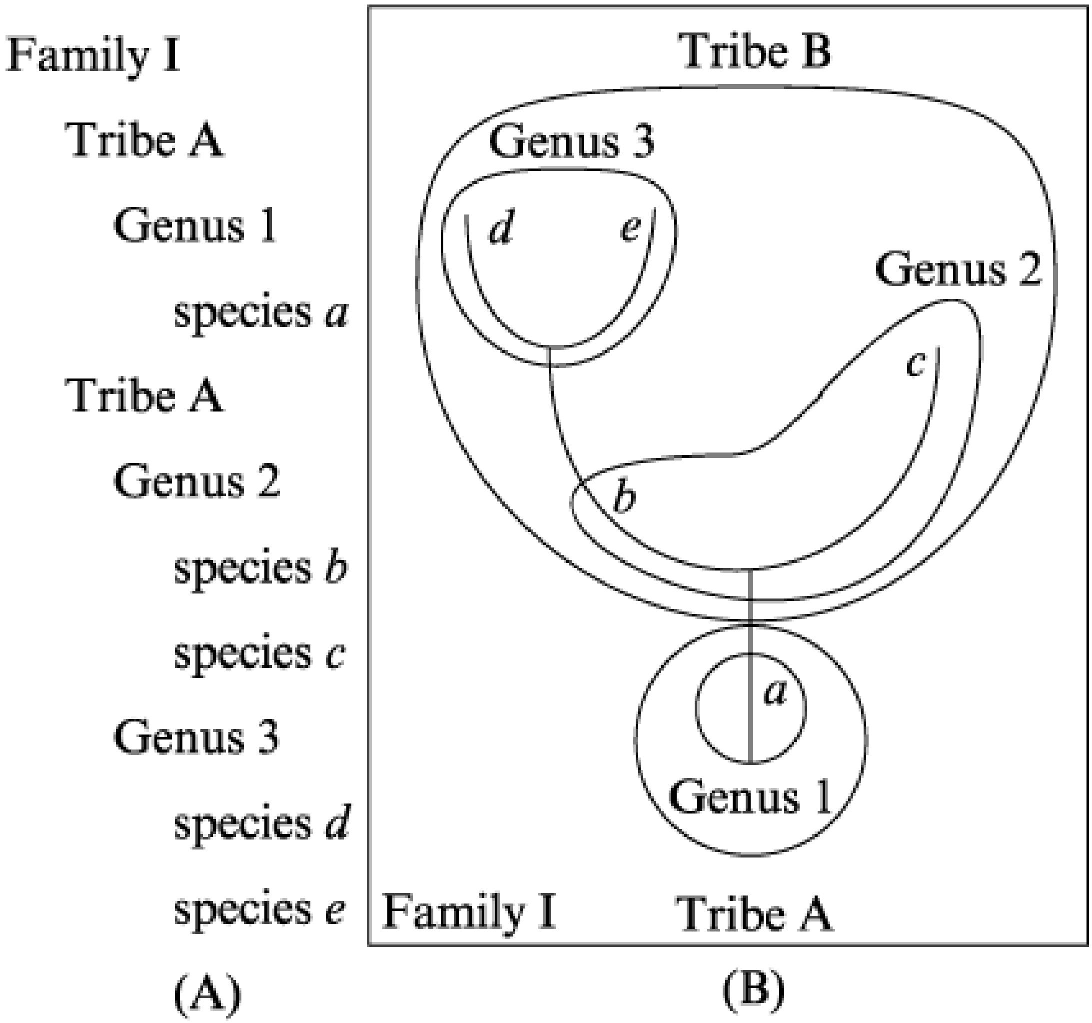

Figure 2. Classification (A) of a phylogeny and that same classification indicated on that phylogeny (B)

Parallel problems arise at the level of characters. If the list of species to be classified happens to include a common ancestor, then no single set of nested characters can be found to define the relevant higher taxa. Some characters will imply that species *a* should be classed with species *b*; other characters will imply that species *a* should be classed with species *c*. Every time an ancestral species is included in a taxonomic study, the result will be conflicting character distributions. In fact, one hint that a set of species under investigation includes common ancestors is continued conflict in character distributions as the study progresses.

The source of the preceding problem is not nature but the structure of the Linnaean hierarchy. The Linnaean hierarchy was developed for structural classifications (see Linnaeus, C. von). When the goal of systematics was changed to have classifications reflect genealogy, no one noticed the deep problems posed by any attempt to translate a historically connected tree into nested sets of taxa. The traditional Linnaean hierarchy is not up to the task. It cannot represent splitting. Nor can it represent the symmetrical relation - merger. Species of hybrid origin are no easier to represent than are common ancestors.

5 Epistemology and the goals of classification

Throughout the history of biological systematics, conflicts have arisen over the kind and degree of certainty that is required in science. At one extreme, some systematists are satisfied to produce classifications based on a host of tacit evaluations and patchy evidence. For them, classification is mainly an art. At the other extreme, are those systematists who insist that intuitive guesses must be replaced by strict quantitative techniques. These systematists

also view scientific theories with suspicion. Two sorts of 'theory' have come under special scrutiny - phylogeny reconstruction and evolutionary theory itself. Systematists have rediscovered a problem long familiar to philosophers. How can one know that a particular chunk of metal is gold unless one knows what gold is, and how can one know what gold is without inspecting some samples of gold? But if one does not know what gold is, one cannot decide what to inspect….

The appropriate response to the preceding question is not all that satisfying. On the basis of very little knowledge mixed with lots of error, one develops a conception of gold. On the basis of this imperfect conception, additional investigations are performed, and these investigations uncover past errors, which increase our ability to discern gold, and so on. On the basis of sketchy data and an imperfect understanding of how evolution occurs, one attempts to reconstruct phylogeny. From these imperfect reconstructions, evolutionary theory is improved, which permits better phylogenetic reconstructions, and so on (see Scientific method §2).

Although character covariations are the primary evidence in phylogeny reconstruction, they are not the sole evidence. Two sessile species that have equally sessile propagules cannot possibly be closely related phylogenetically if the one lives in Mexico and the other in Ethiopia. The goal of making scientific method as simple, straightforward and reliable as possible is justified, but such methodological injunctions should not be made so rigorous that the progress of science is stopped in its tracks. In the last analysis, classifications succeed or fail on the basis of the use that scientists can make of them.

Taylor, Charles (1931-)

Among the most influential of late twentieth-century philosophers, Taylor has written on human agency, identity and the self; language; the limits of epistemology; interpretation and explanation in social science; ethics; and democratic politics. His work is distinctive because of his innovative treatments of long-standing philosophical problems, especially those deriving from applications of Enlightenment epistemology to theories of language, the self and political action, and his unusually thorough integration of 'analytic' and 'continental' philosophical concerns and approaches.

Taylor's work is shaped by the view that adequate understanding of philosophical arguments requires an appreciation of their origins, changing contexts and transformed meanings. Thus it often takes the form of historical reconstructions that seek to identify the paths by which particular theories and languages of understanding or evaluation have been developed. This reflects both Taylor's sustained engagement with Hegel's philosophy and his resistance to epistemological dichotomies such as 'truth' and 'falsehood' in favour of a notion of 'epistemic gain' influenced by H.G. Gadamer.

1 Explanation and interpretation

In his most prominent early publications, Taylor addressed the status of explanation in psychology and the social sciences. *The Explanation of Behaviour* (1967) challenged the adequacy of behaviourism in psychology, principally by arguing that accounting for intentional action entails a teleological understanding of the ends of action that cannot be achieved within purely causal theories. 'Interpretation and the Sciences of Man' (1971) extended this argument to politics and social analysis, showing that attempts at explanation in terms of external approaches to 'brute facts' not only fail to satisfy those who seek more meaningful understandings of human agency, but are also incoherent or incomplete on their own terms. These studies are all parts of a more general argument against the epistemology that both inspired and drew strength from the scientific revolutions of the seventeenth century and after. Taylor holds that this epistemological tradition both relied on an atomistic account of putatively undifferentiated nature (including human nature) and erected a perniciously sharp distinction between knower and object of knowledge, with the result that it drastically distorted and narrowed the scope of understanding of human life (see Behaviourism, methodological and scientific §1).

2 Hegel

The same issues motivate much of Taylor's engagement with Hegel. Hegel too challenged the reigning epistemological tradition and especially its atomistic inattention to the necessary relatedness of all subjects and objects, and to the internal differentiation of both subjects and objects. He argued that any adequate account of the human subject must rely on an understanding of persons as existing only in interaction, as becoming individuals only through participation in an intersubjective reality. Taylor argues that this richer account of the person requires an understanding of language as not merely neutrally picking out objects of attention or reflecting pre-given inner states, but as helping to constitute phenomena and our understanding of external phenomena. Following Johann Herder (see Herder, J. §2), Taylor places these positions on bases significantly different from Hegel's.

This is necessary because Taylor holds that Hegel ultimately failed to achieve the rational certainty about the absolute that he sought. Hegel's arguments reveal an interpretive vision of power and insight, but not a system of determinate necessity. Building then on the critical foundation he shares in large part with Hegel, but rejecting the more extreme claims of Hegel's *Logic* and related elements of his substantive philosophical anthropology and social theory, Taylor has sought to advance an understanding of the nature and activities of and relations among human subjects and of the kind of science that can grasp these subjects, their relations and activities. This entails moving 'beyond epistemology', but not following Hegel in the attempt to ground all argument in ontology.

3 Language

Dualist epistemology is predicated on a rigid separation of subject and object that makes us unable to grasp distinctive features of human life and activity as distinct from the behaviour of physical objects and natural systems. Taylor moves beyond this by developing 'expressivist' or 'constitutive' theories of language, inaugurated by Herder and important to the Romantic tradition, but often left inadequately grounded in an appeal to immediate

self-knowledge. These theories help Taylor to show the human agent to be understandable only as a participant in a linguistic community. Correspondingly, language itself cannot be understood entirely as a matter of reference and predication; instead, Taylor suggests that linguistic activity also involves constructing objects by making identifications of significance that cannot adequately be rendered in truth-conditional form, and that agents are never in a purely external relationship to language, nor indeed to the rest of their worlds in so far as these are constituted through language.

4 Strong evaluation and the self

In a similar fashion, Taylor argues that human agents necessarily engage in different orders of cognition and evaluation. We engage in practical reason always against a background of ‘strong evaluations’. These are simultaneously intellectual and moral commitments that constitute us as knowers and judgers, and that make possible our more specific and immediate knowledge and judgments. Such commitments may vary, but are necessary to the constitution of the self.

Modern moral philosophy has tended to focus on what it is right to do rather than on what it is good to be, and on defining the content of obligation rather than the nature of the good life. In this, it reflects the reliance on the notion of a disembodied, decontextualized and disengaged subject pioneered by post-seventeenth-century science and the epistemology to which it helped give rise. Accordingly, it is a philosophical priority to reconstruct both the dominant modern understandings of the self and alternative interpretations of human agents. Taylor takes on this task in *Sources of the Self* (1989). A key feature of human agency, he shows, is that it *is* constituted only within frameworks of strong evaluation - whether these are traditional notions of the primacy of honour, Platonic accounts of the virtues of reason and self-mastery, modern understandings of the expressive power of inner selves or the virtues of counting everyone’s interests equally. The historical story of the changing character of the modern self is thus inextricably an account of the transformation of more capacities, because these are rooted in changing constructions of agency. Changes in the idea of self, moreover, were often driven directly by attempts to resolve moral or religious problems, though their long-term results were sometimes to undermine the theological or other commitments that give rise to the new conceptions. A crucial moment in this process was the transformation in evaluation of ordinary life, the movement of the world of work and family from the margins of morality to the centre of the modern agent’s moral commitments. This helped to make possible new positive understandings of the self as a physical, including sexual being, and contributed both to utilitarianism, with its reckonings of all manner of satisfactions without reference to the hierarchy that had previously denigrated those of ordinary life, and to Romanticism, with its understanding of the primacy of individual expression (see Subject, postmodern critique of the §1).

5 Communitarianism and multiculturalism

Although these modern transformations of the self lead to new capacities for individuation and fulfilment in interpersonal relationships, these new capacities give rise to new ethical and political challenges. Increased attention to intersubjective community is therefore important not only for philosophical accuracy but for moral life and personal satisfaction. Taylor is thus part of the diverse philosophical and political movement termed ‘communitarianism’. In addition to his enduring emphases on the constitutive role of language and the intersubjective nature of agency, in his work of the 1990s Taylor focused attention on the sociological dimensions of community, including especially the nature of nationalism and the irreducibly social nature of some human goods.

Drawing on his analysis of the modern self, Taylor shows in *The Ethics of Authenticity* (1991) how the search for authentic self-fulfilment can become incoherent and self-defeating when it is tied to atomistic individualism, the overvaluation of instrumental reason and an alienation from public life. At the same time, he argues against pessimism, suggesting that the other elements of our philosophical and cultural traditions give us resources for confronting our current crisis - including the recognition that our wants are necessarily qualitatively distinguishable (so that, among other things, we can want to have better wants), that our individuality is grounded in sociality (so that we can conceive of freedom in ways other than absence of external constraint), and that frameworks of strong evaluation are inescapable (so that the attribution of significance is not simply a matter of immediate subjective choice).

Among the most important themes in this work is a renewed link to Hegel. In many different versions of the fragmentation of political life, Taylor sees a common theme of competing demands for recognition of the legitimacy or value of different identities. This ‘politics of recognition’, appearing in nationalism, ethnic politics, feminism and multiculturalism, is an outgrowth of the modern valuation of self and ordinary life. Claims often assert the rightness and value of differences among people, in contradiction to earlier politics that stressed universal dignity by recommending blindness to differences. Many are incoherent, however, in demanding a recognition of equal worth that can only be met by a ‘soft relativism’, since it is demanded in advance of genuine evaluative engagement. There is no resolution to this dilemma in pure individualistic liberalism because of its homogenizing conception of the person and consequent incapacity to provide a sense of significant differentiation so that partial communities can be centres of value within larger politics in ways that connect members to the whole. A presumption of mutual respect is a useful beginning, but also a ‘mere ought’, unless linked to a notion of the self as, first, necessarily socially engaged rather than merely observing from an external vantage point; second, limited in its capacity for understanding by the very cultural frameworks that make its individuality and understanding possible; and, third, open to change through communicative interaction. Such a notion of the self fits with the aspiration to combine full moral autonomy with the recovery of community both expressive of the common life of its members and constitutive of their individuality (see Community and communitarianism §§2-3).

Taylor, Harriet (1807-58)

Harriet Taylor was John Stuart Mill's intellectual collaborator and great love. Married to John Taylor in 1826, Harriet met Mill in 1830 and they began a brazenly unconventional intimacy which lasted throughout her life. Her thoughts on poetry, equality, liberty and individuality shaped Mill's work on these topics.

Harriet Taylor, *née* Hardy, was born and raised in Walworth, England, where she married John Taylor in 1826. She was introduced to John Stuart Mill in 1830. At the time, she was a restless young wife and mother, deeply involved in a coterie of unitarian radicals whose liberal politics, feminism, and literary and philosophical activities suited her exactly. She had hoped to become a writer, but put aside this aspiration in order to become Mill's intellectual partner. Her amiable and generous husband acquiesced in the peculiar arrangement for her sake. In 1851, two years after Taylor's death, Taylor married Mill, and the couple lived and worked together until her death in 1858. In 1859, Mill began publishing the work of their marital collaboration, extravagantly dedicating everything to her.

Their first collaborative work was the chapter on the labouring classes in Mill's *Principles of Political Economy* (which, published in 1848, prompted an overblown dedication from Mill, discreetly pasted into a few gift copies). Taylor also directed his work on the writings later published as *Three Essays on Religion* (1874). In 1851, she wrote 'The Enfranchisement of Women', which argued for full equality between the sexes with special emphasis on educational reform and equal access to employment. Taylor's greatest claim to lasting importance stems from her role in the writing of *On Liberty* (1859), which Mill later called 'more directly and literally our joint production than anything else which bears my name' (Mill 1873: 249).

Unfortunately, Mill's sober record of Taylor's contributions has been rendered suspect by the hallucinatory lavishness of his praise of her powers. The questions surrounding their collaboration, however, do not concern Taylor's personal attributes, but the extent and nature of her contribution to Mill's work. Her own writing does not settle those questions definitively.

Most of the relevant letters, essays and notes in Taylor's solitary corpus are allusive supplements to ongoing dialogue with Mill. Some of this writing supports Mill's account of her work. Taylor's paragraphs on marriage (*c*.1832, Hayek 1951) are echoed in 'The Subjection of Women' (1869) and the distinctive themes in *On Liberty* first appear in her essay on toleration (*c*.1832, Hayek 1951). There she treats social conformity as a great evil which breeds injustice, stifles individuality and discourages character development. She charges that the indolent acceptance of popular opinion leaves people with baseless conviction and neither the patience nor skills needed to acquire genuine knowledge. She complains that independent thinkers must contend with ignorant majorities. Her arguments are weak, but her whole mode of thought on these topics informs in *On Liberty*.

Mill's corpus sometimes seems to split irreconcilably in two, and Taylor's influence may have caused the apparent fissure. Perhaps the author of in *On Liberty*, 'The Subjection of Women' and various writings on art and society was the offspring of their intimacy, conceived and nurtured in their conversations.

Technology and ethics

Only within the modern period have philosophers made a direct and sustained study of ethics and technology. Their work follows two philosophical traditions, each marked by distinct styles: the Continental or phenomenological tradition, and the Anglo-American or analytical tradition.

Hans Jonas (1979) articulated one of the basic premises of Continental approaches when he argued for technology as a special subject of ethics: because technology has fundamentally transformed the human condition, generating problems of global magnitude extending into the indefinite future, it calls for a new approach to ethics. Jonas' basic premise is expressed variously in the works of Karl Marx, Max Scheler, José Ortega y Gasset, Martin Heidegger and others.

Work within the Anglo-American tradition tends not to deal with technology as a whole but to be organized around particular technologies, such as computing, engineering, and medical and biological sciences. It draws on concepts and principles of traditional ethical theory at least as a starting point for analyses. Although each of the technologies has a unique set of problems, certain themes, such as responsibility, risk, equity and autonomy, are common to almost all.

Social scientists have also raised important issues for the field of ethics and technology. Their work has yielded two dominant schools of thought: technological determinism and social constructivism.

1 Attitudes to technology

The history of philosophy contains two broad moral appraisals of technology. The first, implicitly present in most normative theories prior to the Renaissance, is that technological change is socially destabilizing and therefore should be delimited carefully. Without social stability, it was argued, people die even under conditions where nature is abundant, and technological change easily undermines such stability. The second, characteristic of modern ethics, is that technological change is inherently beneficial because it enhances human welfare and autonomy. Here the argument is that people suffer more from the elements than from other human beings, and that they should therefore work together to conquer nature through technological progress. These two broad ethical views further reflect opposed ideals of human life: on the one hand, an ideal of social community subordinate to nature; on the other, human autonomy and freedom from natural constraint (see Technology, philosophy of).

Only within the modern period have questions of ethics and technology been examined in detail, with two approaches emerging. One grows out of the Continental or phenomenological tradition in philosophy, the other out of the Anglo-American analytical tradition (see Analytical philosophy; Phenomenological movement). Continental philosophers seek to evaluate technology as a whole while Anglo-American philosophers are oriented towards piecemeal assessments of particular technologies. Continental philosophers also commonly argue that traditional ethical theories are inadequate to the moral issues presented by modern technology, whereas Anglo-American philosophers have been more comfortable adapting existing utilitarian or deontological ethical frameworks (see Deontological ethics; Utilitarianism).

2 Continental discussions

Within Continental discussions, Hans Jonas has made the most sustained argument for technology as a special subject of ethics. For Jonas, ethics in premodern times could reasonably allow technology to remain in the background because technology itself had no high moral purpose. Unlike politics or religion, for instance, technology was treated as a marginal aspect of human life, one limited in both power and effect. By contrast, during the modern period technology entered the foreground of human experience. According to Francis Bacon (1620), for instance, the inventions of printing, gunpowder and the compass have done more to benefit humanity than all politics and religion. Jonas believes that because of the Baconian evaluation of technology, 'modern technology has introduced actions of such novel scale, objects, and consequences that the framework of former ethics can no longer contain them' ([1979] 1984: 6). According to Jonas, 'no previous ethics had to consider the global condition of human life and the far-off future, even existence of the race. These now being an issue demands… a new conception of duties and rights, for which previous ethics… provided not even the principles' ([1979] 1984: 8).

The exact way in which technology engenders an epochal transformation of the human condition is, however, open to dispute within Continental discussions. Philosophers as diverse as Karl Marx, Max Scheler, José Ortega y Gasset, and Martin Heidegger all claim that modern technology has transformed the human condition and undermined traditional moralities. But about the particular ways in which technology has altered the human lifeworld there are major disagreements. With regard to appropriate moral responses there are still further disputes.

According to Marx (1867), for instance, 'the modern science of technology' undermines traditional skills and the satisfactions of craft production, placing workers under the control of large-scale, capitalist-owned factories in which labour functions have become equal and interchangeable. The new system of production destroys a traditional social ecology in which the 'species essence' of making things benefited all social classes. Under capitalism material production unequally benefits the upper classes. This disequilibrium can be corrected only by means of a social revolution in ownership of the new technologies. The Marxist ethical assessment of industrial technology thus points up the inadequacy of the modern economic order as a means for the social control of technology, because of the way participation in that order has been restructured by technological change (see Marx, K. §4).

According to Scheler (1915), the technological transformation of the lifeworld is more than an economic phenomenon; it is also the rise and dominance of a new 'ethos of industrialism' even among technical workers themselves. Such an ethos exalts utility and instrumental values such as efficiency over vital and organic ones such as love. This is an axiological disorder that calls for cultural reformation.

For Ortega (1939), however, inherent within the modern science of technology and the ethos of industrialization there arises a moral problem that cannot be addressed by means of either Marx's social revolution or Scheler's cultural reform. Modern scientific technology, in contrast with traditional crafts, radically increases what can be done without any corresponding enhancement of ideals about what should be done. In Ortega's own formulation of the issue: in the pre-modern period, human beings acquired only very specific technical abilities, tightly coupled to particular uses, such as pottery for making pots. They never possessed any generalized technological powers. Now, however, human beings do possess technology in general without any clear idea of particular uses. To address this problem Ortega suggested a need to cultivate what he called 'techniques of the soul' such as yoga.

Undoubtedly the most influential European philosopher to address the issue of ethics and technology, even though he explicitly rejects the discipline of ethics as such, is Heidegger. Heidegger undercuts the distinction between science and technology, and argues that modern scientific technology or technoscience is not so much an ethos as a form of truth. This truth or knowledge reduces the world to *Bestand* or resources available for manipulation by a world-configuring, nihilistic destiny he calls *Gestell*. Heidegger seems at once to make ethical reflection more necessary than ever before and to destroy its very possibility (see Heidegger, M. §6).

One of Heidegger's less controversial theses is the notion that science and technology are interpenetrating practices: the science of nuclear physics is as much the applied technology of cyclotrons and reactors as the technology of nuclear engineering is applied nuclear physics. To the extent that this is the case, the ethics of science tends to merge with the ethics of technology (see Heideggerian philosophy of science).

3 Anglo-American discussions

In contrast to the Continental approach, philosophers following an Anglo-American analytical tradition organize ethical discussions around particular technologies. For example, biomedical ethics includes the study of ethical implications of the use and development of advanced medical technologies (see Bioethics; Medical ethics); information technology ethics (also known as computer ethics) examines social and ethical ramifications of computers and high-speed digital networks (see Information technology and ethics); engineering ethics studies the professional responsibilities of engineers (see Engineering and ethics); and environmental ethics evaluates the effects of various technologies on the natural environment (see Environmental ethics). Work in these areas applies concepts and modes of analysis drawn from analytical moral philosophy and political theory even though, at times, the special problems of new technologies demand an extension of these concepts and methodology beyond their traditional usage.

Each sub-area of ethics and technology is marked by a distinctive community of discourse and unique set of issues. Nevertheless, a number of common themes cut across these specialized domains. Prominent among them are: equity or justice; the problem of risk; responsibility for technology; and the effect of technology on liberty and autonomy.

Historically, issues of social justice, related to the distribution of technological goods and services, were first to become a focus of moral concern. This set of issues played a major role in the nineteenth-century rise of the labour movement, socialism, and the state regulation of technology. More recently, equity issues have re-emerged in acute form in relation to biomedicine, environmental pollution and computers. On what basis should scarce medical resources such as donated or artificial organs be allocated? To what extent does protection of an environmental commons legitimately limit private ownership? How should access to information technologies be facilitated under democratic capitalist structures?

A different dimension of the problem of just distribution of technological benefits is the problem of the equitable distribution of technological costs and risks. The general problem of risk due to technology, however, goes beyond equity concerns, and is part of the more general effort of technology assessment. Technologies often have unintended consequences which, if known in advance, might have altered decisions about their adoption. These consequences may include an increase in risk. Two scholars who have especially influenced work in this area are David Collingridge (1980) and Kristin Shrader-Frechette (1991). Collingridge is well-known for his dilemma of technological (and risk) assessment: in the early development of a technology, when it is relatively easy to control its direction, we inevitably lack the knowledge to exercise reasonable control; yet by the time we have more experience and, along with it, a better understanding of the risks, control has become difficult, if not impossible. Shrader-Frechette argues that persons should not be subjected to technological risk until they have clearly understood the risk and have granted their consent without being unduly constrained by economic or other external pressures. She contends that the concept of free and informed consent as applied in the field of medicine is applicable to technology in general and ought to be a part of what guides morally grounded public policy (see Risk; Risk assessment).

The issue of responsibility for the effects of technology involves two dominant lines of inquiry. One is concerned with the special responsibilities of technical professionals (see Professional ethics). Paul Durbin (1992), for instance, argues that engineers have an obligation to go outside their technical communities to lobby public policy, as when physicists during the 1950s and early 1960s lobbied for a worldwide ban on the atmospheric testing of nuclear weapons or when computer scientists in the United States opposed funding of the Strategic Defense Initiative (the ‘Star Wars’ project) in the 1980s. The second line of inquiry focuses on questions of blameworthiness and accountability when technological innovations or products cause individual or societal harms (see Responsibility; Responsibilities of scientists and intellectuals §3).

Finally, invention and utilization of advanced technologies may be evaluated in terms of liberty and autonomy. In biomedicine, for example, in the name of liberty and autonomy, there have been numerous efforts to work out the exact parameters of free and informed consent, and then to propose ways to institutionalize them (see Consent). In the area of information technology, liberty and autonomy are a key to explaining normative dimensions of privacy as well as prescribing the extent of freedom of speech over the digital networks (see Privacy §2). Langdon Winner (1986) has discussed, in more general terms, the relationship of technology with control and autonomy by looking at ways in which the technological design process and large technical systems, such as roads, restrict human agency, affect political and personal autonomy and delimit the exercise of democratic citizenship.

4 Other approaches to ethics and technology

Political, economic, and social science studies of technology also often have ethical dimensions. For example, political science studies of the governmental regulation of technology and of law-technology relations have obvious implications for ethics. Not only public policy efforts at technology assessment, but attempts to develop scientific techniques of policy analysis ultimately reflect and influence ethical decision-making. The same is true for efforts to manage more effectively social investments in innovation at both the state and corporate levels, and even for welfare economics.

The ethical implications of social science approaches to technology centre around the issue of technological

determinism, that is, the idea that technology is the primary determinant of social life, developing in an almost independent or autonomous manner. During the 1950s and 1960s, critics often opposed popular optimism about the unqualified benefits of technological progress with theories of technological determinism. Ironically, these theories almost immediately galvanized moral protest against technology. This protest was subsequently provided with theoretical justification by new studies that developed a social constructivist understanding of technological change, in which numerous agents and influences could be seen to exercise a series of micro-influences often invisible at the macro level (see Technology, philosophy of §4). Determinist and social constructivist interpretations, although apparently opposed, have quite similar moral implications. Both effectively highlight the continuing need for ethical examination of technology in a highly technological world.

Technology, philosophy of

The philosophy of technology deals with the nature of technology and its effects on human life and society. The increasing influence of modern technology on human existence has triggered a growing interest in a philosophical analysis of technology. Nevertheless, the philosophy of technology as a coherent field of research does not yet exist. The subject covers studies from almost every branch of thinking in philosophy and deals with a great variety of topics because of a lack of consensus about the primary meaning of the term 'technology', which may, among others, refer to a collection of artifacts, a form of human action, a form of knowledge or a social process.

Among the most fundamental issues are two demarcation problems directly related to the definition of technology. The first concerns the distinction between technological (artificial) and natural objects. It involves the relation between man, nature and culture. The second pertains to the distinction between science and technology as types of knowledge. The science-technology relationship has become of central importance because of the widespread assumption that the distinguishing feature of modern technology, as compared to traditional forms of technology, is that it is science-based. Another much discussed issue is the autonomy of technology. It deals with the question of whether technology follows its own inevitable course of development, irrespective of its social, political, economic and cultural context.

1 Philosophy and technology

The following enumeration of approaches is intended to convey an impression of the strongly fragmented field of study that goes by the name of philosophy of technology.

What is (the essence of) technology? In philosophical-anthropological studies, the starting point for answering this question is the human being and its place in and relation to nature. The human being is considered to be a defective animal that is dependent on technology for its survival; technology becomes the substitute for biological shortcomings and is therefore determined to a large degree by the nature of these shortcomings. For Heidegger (1977) such a characterization of the essence of technology is not sufficient; an answer at the metaphysical level is also needed. For him the essence of technology is not that it is a means to some end: technology brings to the fore what was hidden and does not by itself present itself (see Heidegger, M. §6; Heideggerian philosophy of science). In Dessauer's (1927) metaphysical approach, invention is the essence of technology and the ontological conditions that make invention possible are explored.

The social philosophy of technology focuses on the relations between (specific forms of) technology and social, economic and political structures. It analyses technological development as a social process and addresses the problem of how to control its development. One of the key problems in this field is whether technological development is primarily determined by its context (social shaping of technology), or whether technology determines the social context including its systems of norms and values (a position often attributed to Marx). In the latter case, the idea of a technocratic society emerges in which technological rationality imposes itself on all domains of social life (technology as an ideology (Habermas 1968); see Habermas, J. §1).

Ethical studies take a prominent place in the philosophy of technology. New technological possibilities for human intervention create new moral problems. Do these require new ethical principles? Arguments in favour are based mostly on the idea that modern, science-based technology is essentially different from earlier forms of technology (the crafts), and that its impact on man and nature is of a different order (for example, the consequences of applying modern technology are no longer limited in space and time (Jonas 1984)). Another issue in this field concerns the claim that technology itself, as a system of means, is ethically neutral. Arguments against the neutrality thesis attempt to show that the conception of technology as a mere system of means is inadequate, because its impact on human life stretches much further: it replaces the natural with an artificial environment (see Technology and ethics).

The so-called 'analytical philosophy of technology' (Rapp 1974) shows a strong focus on epistemological and methodological problems of technology, particularly of the engineering sciences. These problems have long been neglected, because of the widespread idea that technology is applied science. A specific feature of this approach is that it takes into account the various types and stages of technology and its concrete historical form of appearance.

Key topics are the nature of technological knowledge, the nature of engineering design, design methodology and the relation between science and technology. Its main disciplinary sources are, besides philosophy, technology itself and the history of technology.

2 Technology and artifacts

The usual conception of technology is that it is the transformation or manipulation of nature (the existing physical (material) and biological environments) to satisfy human needs and goals. Technology is thus conceived to be a specific form of purposeful (teleological) action, that may result in a 'technological artefact': a human-made object or state of affairs that fulfils a utilitarian or practical function. The transformation of nature may or may not itself be mediated by artifacts, which are then called tools (see Teleology).

This conception of technology raises many questions. On the one hand, it appears too restrictive, for it does not fit certain domains which are considered to belong to modern technology, such as software engineering which deals with the transformation of something immaterial (information). On the other hand, it is too broad, since it makes any object or state of affairs which satisfies a practical need, and is the result of intentional human intervention in nature, a technological artefact (for example, a wild tree planted deliberately at a certain place to provide shadow, or an organism with a slightly modified genetic structure).

The demarcation problem - what kind of action constitutes a technological action and what kind of objects or states of affairs are technological artifacts? - remains an open issue. Not only is the distinction between the technological and the artificial problematic, but also that between the artificial and the natural. The latter raises fundamental philosophical issues about the relation between the human race and nature. The distinction makes sense only if the human race is considered in some respect not to be part of nature. As an integral part of nature (and as a result of natural evolution), a human being cannot interfere with nature. The distinction between the natural and the artificial is commonly taken to be identical to the distinction between the spontaneous and the intentional; these notions themselves, however, raise all kinds of philosophical problems (see Environmental ethics §4).

Similar questions arise when technological artifacts are characterized as objects that perform practical functions on the basis of *human designs*. In technology a design is taken to be a pattern or scheme that describes the structure and mode of operation of a system and shows how a given practical aim or function may be realized. The notion of design stresses the inherently intentional/teleological nature of technological artifacts. The distinctive feature of technological artifacts as compared to objects from nature remains problematic, however. Is the difference primarily a genetic one (produced by humans or by nature), or is it more fundamental in the sense that the attribution of a design to objects of nature is meaningless (as in the modern scientific conception of nature)? These questions inevitably lead to issues in the philosophy of nature.

3 Technology as knowledge

For Aristotle science and technology belonged to two different spheres of human experience (contemplation versus productive action) and constituted two different forms of knowledge (theoretical versus practical knowledge). Scientific knowledge was, moreover, not inherently relevant for solving technological problems (see Aristotle §6). Modern technology and science, however, have merged to such a degree that even the demarcation between them has become problematic. Modern technology is science-based (and modern science, technology-based) and alongside the traditional natural sciences engineering sciences have established themselves. The so-called 'scientification of technology' is generally considered to be the characteristic feature of modern technology that is directly related to its prominent role in society. This has directed attention to the problem of the relation between science and technology and how science has altered the nature of technology. From a cognitive point of view, the nature of technological knowledge and its relation to scientific knowledge is at issue.

One of the most influential models for the science-technology relationship has been the technology-is-applied-science model. It stresses that technology, in contrast to the traditional crafts, is as theory-laden as science and that it applies scientific theories to systems which are of practical use. It considers technological knowledge to be a derivative kind of scientific knowledge. This model has been criticized severely. It is historically inadequate because it makes technological progress wholly dependent on scientific development. From a cognitive point of view it is highly problematic because it assumes that there is a logically deductive path

from scientific knowledge (theories) to technological designs.

A generally accepted alternative for the technology-is-applied-science model is, however, still missing. A strong case could be made for considering technological knowledge, with respect to scientific knowledge, to be a form of knowledge *sui generis*, which deals with the design and production of artifacts. One of the considerations in favour of such a view concerns the fact that the criteria for evaluating cognitive claims are fundamentally different in the two domains.

In its most basic form technological knowledge is prescriptive; it consists of procedures (rules) which describe actions that have to be performed in order to achieve practical ends. Often, an adequate performance of these actions requires practical skills; these also constitute a form of technological knowledge, which, however, cannot be expressed in terms of prescriptions in language. The first criterion for evaluating a procedure that purports to solve a technological problem is its *effectiveness*: does the procedure bring about the desired state of affairs? The second criterion for assessing a solution is its degree of *efficiency*: is it possible to bring about the desired state of affairs in a better way, that is, with less effort or costs. (In general, measures of efficiency are based on quantitative comparisons of input and output of technological systems.) In modern technology, the notion of efficiency plays a dominant role, and the evaluation of the efficiency of artifacts is often carried out with theoretical means; at this point scientific theories about the operative principles of an artefact turn out to be of great value.

While efficiency, effectiveness, and other criteria like durability, costs, manufacturability, safety and utility, are key notions in the structure of thinking in technology, they play almost no role in science, because scientific knowledge is primarily descriptive and explanatory. Among its principal evaluative criteria we find truth, empirical adequacy and explanatory power. This difference in basic concepts for interpreting and evaluating knowledge claims strongly supports the idea that two different forms of knowledge (and of rationality) are involved in science and technology. Further insight into the characteristic features of technological knowledge, that is, in the epistemology of technology, has to come from detailed case studies (Vincenti 1990).

4 The dynamics of technological change

A recurrent theme in the philosophy of technology is the autonomy of technological development relative to its social embedding. It concerns the dynamics of technological change. This is an extremely complex topic since technological innovation, in its various stages from design, development, production and diffusion, is influenced by very heterogeneous factors (cognitive, economic, social, political, military, geographic, cultural, and so on). Views on the dynamics of technological change tend to show strong reductionistic tenets by taking one of these factors as the prime mover of technological change. Well-known illustrations are ‘technological determinism’ and ‘social constructivist interpretations of technology’. According to technological determinism technology itself is the prime mover; this view maintains that technology follows its own intrinsic course of evolution to which society has to adapt; it is self-determinative with increase of efficiency as one of its main dynamical principles. So there is no room for alternative forms of technology. Social constructivist interpretations of technology, on the other hand, claim that technology is to a large degree, or even completely, socially determined (see Constructivism).

In order to uncover some of the basic assumptions underlying these ideas we will briefly examine the shaping of artifacts in the design phase. The final form of an artifact is schematically determined by two kinds of constraint. On the one hand, there is the list of specifications which describes all kinds of requirements the artefact should fulfil. This heterogeneous list may contain, among others, constraints derived from the primary technological function of the artefact, the conditions under which this function has to be performed in practice (for instance, safety regulations), the conditions under which the artifact has to be produced (for example, mass production), its price, standards and norms. The defining feature of this list is that it is the outcome of a process of negotiation between all parties with some interest in the artefact; it contains social or contextual constraints, which are imposed by convention. On the other hand, there is a list of technological constraints, constraints due to what is, as a matter of fact, physically and technically possible (this list may, of course, change over time). The desired artefact should satisfy both lists of constraints, but because of conflicts this is often not possible in practice. Such conflicts can be resolved, again schematically, by adapting the list of specifications or by creating new technological possibilities.

According to this conception of the design process, the driving force behind technological change is the tension

between two lists of constraints which are different in nature (one describing what is desirable, the other what is possible) and in principle independent of each other. Defenders of the autonomy of technology reject this independence; they assume that the list of specifications is determined primarily by technological constraints ('what can be done, will be done'). The decisions leading up to the list of specifications are supposed to be dictated by technological imperatives (technological rationality). Social constructivists, on their part, tend to deny any difference in nature between the two types of constraint: they assume that physical and technological constraints are socially constructed in ways similar to the constraints contained in the list of specifications.

These assumptions may be criticized on philosophical grounds, but much more important for the assessment of these views is that the issue of the autonomy of technology is not to be settled by philosophical arguments alone. Models for the dynamics of technological change (with their underlying philosophical assumptions) must prove their value in empirical research, particularly in the history of technology. Generally speaking, a 'historical-empirical turn' in the philosophy of technology might prove to be fruitful for developing more adequate conceptual schemes for interpreting technology and its development.

Teilhard de Chardin, Pierre (1881-1955)

Pierre Teilhard de Chardin taught that the evolutionary process is governed by a 'law of complexification' which dictates that inorganic matter will reach ever more complex forms, resulting in inorganic matter being followed by organic matter and organic matter being followed by conscious life forms. Viewed by observers, humans are material systems within a larger physical system. Viewed introspectively, a human being is a self-conscious creature possessed of freedom and rationality, with the capacity for action and inquiry. Each element in the world has some form of this dual 'exterior' aspect and 'interior' aspect, though consciousness arises only late in the evolutionary history. Teilhard de Chardin saw neither reason to doubt that matter can give rise to mind, nor any basis for reducing mind to matter. The prospects for humanity are gratifying, as evolution, following the law of complexification with the cooperation of human choice, moves to an Omega point at which Christ's fullness will include as his 'body' a unified humanity that is at peace.

Scientific critics of Teilhard de Chardin's theory have charged that his optimism involves extrapolation far beyond what the present evidence warrants. Theological critics have argued that he does not sufficiently consider the degree of evil in the world; optimism can only be justified if we assume that evil can be redeemed by transcendent divine action, because immanent evolutionary processes may not suffice.

1 Life

Pierre Teilhard de Chardin, the fourth of eleven children, received his secondary education at the Collège Notre-Dame at Mongre, and, at eighteen, entered the Society of Jesus. He read Bergson's writings, and an association with Eduard Le Roy, a Bergsonian scholar, deepened the Bergsonian influence on Teilhard de Chardin's thought. While his views often sparked keen dissent within the Church, he remained a Jesuit and a loyal Catholic. Repeated requests to the Church for permission to publish his best-known work, *Le Phénomène humaine* (1953), were refused, and it was published only posthumously. He sought a way to unite his 'love for God' and his 'love for the world'. The product was not merely a view which sanctions the dignity of scientific endeavour, but a complex worldview in which cosmic evolution is the process by which God brings into being a 'fullness of Christ' that includes a morally and spiritually mature humanity and a fully developed natural environment.

Teilhard de Chardin taught in the Jesuit College in Cairo (1906-8), served in the First World War, and taught at the Catholic Institute in Paris; when he was fired from this post, he travelled to China. He was a distinguished geologist and palaeontologist, especially concerned with human prehistory, and in China participated in the palaeontological researches surrounding the discovery of Peking Man. He was associated with many expeditions and became director of the research office of the Centre National de la Recherche Scientifique in Paris. After the Second World War, he was offered a chair at the Collège de France, but instead went to New York, where he was made permanent assistant at the Wenner-Gren Foundation for Anthropological Research. He was an Honorary Fellow of the Royal Anthropological Society of Great Britain, and an honorary member of the Academy of Sciences of New York, as well as a member of the French Academy of Sciences and the American Association for Geology.

2 Priest and scientist

It was Teilhard de Chardin's goal to find for himself, and then share with others, a worldview that unified his theological beliefs as a Catholic and professional beliefs as a scientist. He thus developed a synthesis of Catholic theology and evolutionary theory which he claimed was satisfactorily founded in evidence and reason. In it, he rightly remarked, the traditional juridical and political terms in which much of Catholic thought had come to be classically expressed were replaced by terms derived from the natural sciences, although he extended them beyond their native home in scientific theory. It would seem that he thought these terms received much less stretching at his hands than many of his readers, both scientists and theologians, suppose.

It seems clear as well that while Teilhard de Chardin had apologetic interests - he wanted to argue for his faith - and communication interests - he wanted his faith to be intelligible to modern readers - he had a more basic motivation. He thought that his newly crafted worldview was a natural and appropriate convergence of the picture of the world presented descriptively by evolutionary science, and the doctrines of an orthodox (if nontraditionally

stated) Catholicism; his main reason for presenting his worldview was that he thought it was true.

Teilhard de Chardin described his intellectual project as providing a phenomenology of the physical universe - a description of the universe that arises from and is justified by what the natural sciences have discovered the world to be. The resulting account of things has a surprising consequence. Included in his notion of a phenomenology is that it should say what the functions of the phenomena are and give an account of the purposiveness that phenomena actually exhibit. His account of the function and purpose of the evolutionary process is, of course, controversial. He contends, for example, that since the evolutionary process has plainly produced human beings, and we see no new species on the horizon to replace them, it is in humanity that we find the best clue to understanding the process. This in effect involves him in thinking in terms of final as well as efficient causes (to put the matter in traditional language), and in viewing this as part of what is properly included in a phenomenology that is scientifically based.

Teilhard de Chardin viewed the universe in both theistic and evolutionary terms; the world owes its existence and structure to God, and God is immanent in it. The universe is an immense organic whole which is driven by its inner energies toward greater and greater order and complexity. His notion of evolution is cosmic, not simply biological; within the framework of his evolutionary theory there appear not only mutating forms of life but also inorganic matter and, ultimately, social and cultural systems.

3 Optimism and evolution

Much has been written about the medieval view of an orderly universe, quite limited in scope, created for human habitation, and centred on our earth, whose plants and animals served human ends. Earth was a rather manageable habitation which served its resident landlords rather well as a temporary home until their real home was reached in the afterlife. Then astronomers revealed the vastness of the universe, physicists discovered that the same laws applied beyond the moon as applied below it and that the universe is a vast machine, biologists found a minuscule universe of a vastness comparable to the macrocosm, Darwin robbed humanity of its uniqueness, and Freud stole from humanity its fundamental rationality. The result is a universe in which human beings live a precarious unfree existence in a natural environment that is at best neutral, while beset with inner forces that threaten what sanity they possess as they wait for entropy to wind things down.

Without considering how accurate all this is, either as regards medieval or modern thought, perhaps the broad strokes of the preceding paragraph give some sense of what Teilhard de Chardin was fighting. He insisted that the very evolutionary theory that played a significant role in questioning the uniqueness and hence special worth of human beings, when properly understood and articulated, restored that very uniqueness and worth. He denied that the universe was machinelike, static, deterministic, neutral or unfriendly to human existence, or doomed to an inelegant ending. He held that humanity is an entirely natural denizen of the world without thinking that the existence of human beings is to be naturalistically explained - not, at any rate, if 'being naturalistically explained' denies either human rational and volitional transcendence of determining conditions or theological explanation of the evolutionary process.

Teilhard de Chardin suggested that the earth's history has three phases. First, there is the cooling of the earth's crust and the presence of inorganic matter. In the second stage, organic matter arises as life emerges and diversifies. The third stage begins with the appearance of mind. Geosphere is succeeded by biosphere, biosphere is followed by noosphere. While the first stage leads naturally to the second, and the second to the third, both later stages none the less contain something qualitatively new. In the third stage, there is a qualitative shift in the nature of the evolutionary process itself as the products of evolution become capable of contributing to, and potentially directing, the future of the process.

Humanity, Teilhard de Chardin held, is 'separated [from the other elements of the evolutionary process] by a chasm - or a threshold - which it cannot cross. Because we are reflective we are not only different but quite other. It is not a matter of change of degree, but a change of nature, resulting from a change of state' ([1953] 1959: 165-6). Thus the evolutionary process exhibits discontinuity within continuity in an ascent from less to more organized forms of matter. Material synthesis and complexity are viewed as one aspect of the same stuff that, in its highly complex versions, has intellectual and spiritual capacity as another aspect.

4 Beginning and goal

Teilhard de Chardin saw human beings as both the end or goal of the evolutionary process and as a new evolutionary beginning, not to be replaced by a new species. Evolution now and in future is a process under new rules; humans act freely in the context of natural laws, rather than one nonintelligent event following another. Without supposing that detailed projections are possible, he took the future to be the key to the past and believed that science justifies an optimistic forecast of the future of humanity. It is likely that this optimism, grounded at least in intent in a rationally developed worldview, is part of the explanation for the enthusiasm Teilhard de Chardin's views often elicit.

Currently, humanity experiences diverse cultures and forms of intellectual life; it is an often warring, significantly immature species. None the less, humanity's capacity for self-conscious thought and action provides a new layer or sphere on the surface of the earth - a 'noosphere' that is the unique environment of human beings, shared not even with the highest nonhuman animals. This sphere too is subject to the law of complexification, and thus there will be a cultural unification in which humans learn to live in love and peace. When this 'Omega point' is reached, a united humanity will serve as the body of Christ, and Christ will have achieved the fullness that it has been the point of evolution to produce.

It follows from Teilhard de Chardin's views that it is important to understand the world in terms of theistic cosmic evolution. While there are powerful tendencies to 'complexification' in nature, once human beings arrive on the scene there is in principle the possibility of their acting sufficiently unwisely or wickedly as to postpone, diminish or even prevent the arrival of the Omega point. After all, according to Teilhard de Chardin's view (though this is certainly not unique to his perspective), the course of evolution is now significantly in human hands; none the less, it is plainly his view that optimism is justified concerning the prospects of the Omega point actually being reached. The later chapters of the book of evolution seem sure to be happy ones.

For Teilhard de Chardin, Christ himself is primarily the Cosmic Goal of the evolutionary process ('Christ' here is intended to refer to both the Second Person of the Christian trinity and his 'body' of collective mature humanity). The redemption that Christ provides according to the Christian message is seen in cosmic as well as individual terms, and for Teilhard de Chardin, these cosmic terms are seen along the lines of a gradual and predictable change for the better, and are conceived more in terms of immanence than transcendence.

5 Criticisms

Teilhard de Chardin's scientific critics, even those who agree that the course of evolution is now partly under human management, find in rising population, environmental pollution and decreasing resources significant grounds for being dubious about evolutionary optimism. They worry that entropy in the long run will end human life and that increasing specialization will diminish the quality of life. Most fundamentally, they find in Teilhard de Chardin's perspective an extrapolation that goes far beyond anything they discover in actual science, and are unconvinced that anyone who follows his lead will thereby be walking in the overall direction (if any) suggested by scientific conclusions. Thus they see little or no justification in actual scientific theory for Teilhard de Chardin's Christian cosmic evolutionism.

Theological critics (for example, Smulders 1967 and Thielicke 1964) have worried that the 'in principle' possibility of human evil, manifested individually and institutionally, might not be too deep for real confidence in any immanent process leading to a cosmic kingdom of God. They view Teilhard de Chardin as taking altogether insufficient account of the depth of evil in the human heart and in the institutions that we have created. It seems to them all too likely that the outcome will be at least no better than what we currently experience unless there is special divine intervention of a sort not really in the spirit of his theory.

Teilhard de Chardin sees sin as an inevitable feature of the evolutionary process, which is to be overcome as the law of complexification works in concert with right human choices and actions. This seems to his critics to involve a sort of self-healing theory of the universe in which they have no great confidence. Much of the Christian tradition has insisted on a significantly greater role for transcendent divine action than seems evident in, or consistent with, Teilhard de Chardin's conception of things. For most of that tradition, the Fall is neither a fall 'up' towards maturity, nor an inevitable part of a process that leads upward. It has thought in terms of people, and often also of nature, as needing regeneration, not merely time to develop. Its optimism rests more on faith and hope in

the activities of a transcendent Saviour than on faith in the progressive unfolding of immanent principles built by the Creator into the creation. Thus Teilhard de Chardin's Christian critics stress that the problem that Christ came to deal with was our sin, which includes not only individual wrong actions knowingly performed, but a commitment to a style of life centred on our own apparent advantage in disregard to the will of God and the good of others. Christ is thus the Saviour who dies for our sins and rises again for our justification, the Judge who condemns both sin and the unrepentant sinner who clings to sinfulness and rejects forgiveness and grace, and the Lord of all Creation. The Christian critics argue that Teilhard de Chardin subordinates the roles of Saviour and Judge to that of Lord of Nature in a way that trims the sails of Christian doctrine to fit the masts of evolutionary optimism.

At times asserting that his views arose naturally and with considerable evidential support from the data of science, Teilhard de Chardin at other times emphasized the tentative and partial nature of his perspective. At the least, he coherently placed a massive amount of scientific data within a theological perspective that most of his colleagues had dismissed or ignored, and (perhaps not altogether intentionally) illustrated the fact that scientific data, as philosophers of science say, 'underdetermine' the world views based on them.

Tel Quel School

Tel Quel was a review published in Paris from 1960 to 1982. Under the direction of Philippe Sollers, it became a key source of avant-garde work in literature and critical theory. Concerned with the relations between art and politics, the Tel Quel *group drew on semiotics, psychoanalysis and Marxism as the bases for an overall theory that would establish writing -* écriture *- as having its own specific and necessary revolutionary force. Influential in its emphasis on literary practices seen as breaking with the given social ordering of 'reality' and 'subject' (the 'limit-texts' of writers such as Sade or Artaud), the review emphasized textuality, the condition of all fields of knowledge as textual productions. Less a coherent school of thought than a site of shifting theoretical-political interventions and new explorations in writing, Tel Quel was at its most powerful in the late 1960s and early 1970s.*

1 History

Founded in 1960 by a handful of young writers under the auspices of the French publishing house *Editions du Seuil*, *Tel Quel* was a review appearing quarterly until 1982. Purely literary concerns quickly gave way to attempts to define a specific role for literature as a factor in social change and to explore possible alliances with existing political formations. In the late 1960s, while elaborating a revolutionary cultural theory of writing and its practice, the review drew close to the French Communist Party (*PCF*), espousing many of its positions. In 1969 there was a shift to criticism of the Party's 'revisionism', with *Tel Quel* asserting a Marxism-Leninism of which Maoism and the Chinese Cultural Revolution were regarded as the authentic contemporary manifestation. The final break with the *PCF* came in 1971, with some members of the review's board forming the *Mouvement de Juin 1971* which briefly issued *Tel Quel Informations*, a bulletin devoted to violent criticism of the *PCF* and unbridled celebration of the People's Republic. A *Tel Quel* delegation visited China in 1974 but the visit coincided with, and contributed to, a disaffection with Communism that led in 1976 to dissociation from the Chinese model and the 'Marxist church'. Communism and the 'myths' of the left now became the object of the review's combat, with dissidence valued as the epitome of literature's purpose. *Tel Quel* ended in 1982, only to be resurrected as *L'Infini*.

The core members of the editorial board were Philippe Sollers, Marcelin Pleynet and Julia Kristeva. Jacques Derrida was a decisive contributor in the 1960s and Roland Barthes a major one throughout. A series of books - the '*Collection Tel Quel*' - was linked with the review, which also instigated various cultural events.

2 Theory

Tel Quel's initial orientation was determinedly literary, in opposition to Sartrean existentialism and the demand for *littérature engagée* (literature as an instrument of social commitment). Stating its aim to be a clear understanding of 'the powers of writing', the review began with a vaguely romantic declaration of literature's value and a determination to free it from moral and political imperatives: literature was to be taken on its own necessary terms as the mode of discovery of the world as sensory whole. Surrealism was acknowledged as a significant historical precedent but also as a movement in relation to which the review sought to make its own distinct advance.

Consideration of writing's powers and of the nature of its realization of the world 'as is' (the sense of the review's title) was undertaken both through an analysis of literary forms and through an engagement with bodies of writing that questioned given conventions. An immediate reference was to the critique of the traditional terms of the novel represented by the *nouveau roman* and notably to the work of Alain Robbe-Grillet, itself critical of Sartre's instrumentalization of literature and self-reflexively involved in the showing up of conventional fictional structures. The nouveau roman, however, was soon repudiated as complicit with old assumptions, as once more referring literature to the representation of a reality projected as external to its writing, whether physical ('realism') or mental ('psychologism'). Hence the contrary importance of 'limit-texts' that disturb the homogeneity of reality in its accepted forms, subverting representational coherence, subject unity and the notion of a truth outside linguistic constructions: Sade and Artaud, Lautréamont and Bataille were read as inscribing within the Western tradition a permanent refusal of the comforts of any such 'truth'. The force of literature was defined as exactly that refusal, its practice as a radical knowledge of the tissue of fictions in which we and our world are 'made up'.

To take literature in this way was to break with ideas of it as the expression of universal ('human') meanings and values, and to assign to it a fundamental role for change. Literature and politics were seen as interdependent, not in

terms of the former's subordination to the latter (submission to imperatives again), but in as much as literature - in *Tel Quel*'s avant-garde version of its excessive practice - was understood as a condition of political transformation: no economic and social revolution without symbolic revolution. Surrealism's weakness was identified precisely as its failure scientifically to make the link between revolution and writing - it lacked the textual theory that from the mid-1960s to the mid-1970s became *Tel Quel*'s purpose to provide.

The beginnings of the theory were in structuralism and semiotics: the analysis of the underlying structures of cultural phenomena grasped as systems of signs seemed to offer a possible science of literature rid of any idea of the latter as externally derived (works as originating in a reality they represent or an author they express). Confronted, however, with the experience of writing realized in the limit-texts, as in the *Tel Quel* group's own novels and poetry, structuralism appeared as based on a static conception of structure which, while effectively serving to remove the subject as consciousness from any central and founding position, ended in an ahistorical 'objectivity'. If everything is only signs, structuralism's metalinguistic certainty of structures to be perceived through the agency of its analyses is itself in question. The recognition semiotics should provoke is that there can be no mastery of language since language includes - is constitutive of - the subject assuming such mastery. A science of literature must work with just this recognition which is, indeed, literature's own troubling power and so its challenge to any science or knowledge classically conceived (in terms of a closure of textual production, of the elimination precisely of all 'literariness' of language).

Crucial here was the work of Jacques Derrida with its development of an idea of writing - tracing of differences - as the structuring condition of presence (see Derrida, J. §2). There is nothing without writing, no 'outside-text' in the sense of some instance to which a text could be referred that would not itself be textual. Derrida's critique of the Western conception of the sign as underpinning a continual denial of writing (the signified received as having an identity distinct from the signifier) could be given an explicit political thrust when carried over to the understanding of ideologies as systems masking textuality and the production of posited 'grounds' of meaning. The struggle against what *Tel Quel* called 'the hypostasized result of a genesis effaced' and the retrieval of the materiality of the signifying process determined the ambition of the group's textual theory: 'a kind of permanent writing' that would break down the discursive orders of social intelligibility and accede to 'the figured truth of the world'. The *semanalysis* of J. Kristeva reformulated semiotics in these terms, pushing it beyond the study of sign systems into that of signifying practices, demanding an attention each time to the production of meaning and subject involved.

Tel Quel was thus characterized by a militant critique of representation for its containment of textual productivity but this critique was characterized in turn by the resolve not to be caught thereby in the position of accounting language the only reality. Against such idealism, *Tel Quel* proposed a 'semantic materialism': a text - any representation, discourse, piece of literature, philosophy or whatever - is never derived or justified from a point outside of textuality *and* there is a heterogeneous material reality inscribed in the subject's production in and through textuality that is at once social and psycho-sexual. The review thus took as its necessary task the articulation of historical materialism (using the work of Louis Althusser) and psychoanalysis (using that of Jacques Lacan) within a general theory of this textual process of the production together of subject-history-desire.

By 1977, belated disillusionment with existing Communist societies had shifted the review into distrust of any political vision of the world and the conviction of the impossibility of revolution. With Freud's pessimism concerning the human psyche defeating Marx's optimism regarding social transformation, the limit-texts were again important, read as engaging the impasses of sexuality and subjectivity, as exploding the dangerously deluded Enlightenment ideas of reason and progress to which political projects like Marxism refer. To these texts were now added the literary testimonies of the modern dissidents (Alexander Solzhenitsyn in particular). *Tel Quel*'s conception of writing was discharged of political terms and returned to an insistence on literature's value in itself as the fundamental site of freedom, dissidently marginal to all establishments of meaning.

Throughout the changes and reversals in the review's positions, what remained constant was the will to propose literature as a vital and vitally specific force. *Tel Quel*'s significance lies in its extreme theoretical and practical exploration of the political possibilities and contradictions of such a proposition.

Teleological ethics

The Greek telos *means final purpose; a teleological ethical theory explains and justifies ethical values by reference to some final purpose or good. Two different types of ethical theory have been called teleological, however. Ancient Greek theories are 'teleological' because they identify virtue with the perfection of human nature. Modern utilitarianism is 'teleological' because it defines right conduct as that which promotes the best consequences.*

Twentieth-century philosophers have distinguished ethical theories as 'teleological' or 'deontological', placing classical Greek and Roman theories alongside utilitarianism in the first category, and Kant's ethical theory together with rational intuitionism in the second. As the distinction is usually drawn, a teleologist explains the rightness or virtue of action in terms of the good realized by means of it, while a deontologist treats rightness as an independent value, and argues that we may be required to do what is right at the expense of realizing the good (see Good, theories of the; Right and good).

This distinction, however, obscures the difference between two different types of theories that have been called 'teleological'. Classical philosophers like Plato and Aristotle, and modern Idealists like Bradley and Green, are 'teleologists' because they believe that human nature is fully realized or perfected through the practice of virtue (see Perfectionism). Virtue, according to these philosophers, is not a means to human perfection: instead, virtue is itself the perfection of human nature - in the way that intelligence is the perfection of thought, or beauty of appearance. In these theories there is no general distinction between 'the right' and 'the good': as expressions of the virtues, virtuous actions are good in themselves.

Modern 'teleologists', by contrast, assign virtuous or right action only an instrumental value (see Consequentialism). In this respect, modern 'deontologists', who see the rightness or virtue of an action as a kind of value that is intrinsic to it, are closer to the classical teleologists (see Deontological ethics). What distinguishes modern deontologists from classical thinkers is that they recognize forms of 'natural' or nonethical goodness which are independent of, and can conflict with, ethical values. For instance, many modern deontologists identify happiness with nonethical goods like pleasure, the pursuit of which can conflict with the right (see Happiness). By contrast, Plato and Aristotle argued that *eudaimonia*, happiness or flourishing, essentially involves virtue (see Eudaimonia). In treating happiness as an independent or nonethical value, modern deontologists resemble the modern 'teleologists', who believe that right action is simply that which promotes an independently identifiable good.

Thus although both classical and modern teleologists believe that the good is realized through virtuous action, it is in different senses. Classical teleologists argue that virtue is identical with the best state of a human being, while modern ones argue that virtue promotes an independent, nonethical good. Philosophers in the late twentieth century have begun to mark this distinction by referring to those who believe that rightness consists in the production of nonethical good as 'consequentialists' rather than 'teleologists'.

Teleology

Teleology is the study of purposes, goals, ends and functions. Intrinsic or immanent teleology is concerned with cases of aiming or striving towards goals; extrinsic teleology covers cases where an object, event or characteristic serves a function for something.

Teleological explanations attempt to explain X by saying that X exists or occurs for the sake of Y. Since the question 'For what purpose… ?' may be construed either intrinsically or extrinsically, such explanations split into two broad types: those that cite goals of an agent, and those that cite functions.

The history of Western philosophy and science has been characterized by major debates about the logic, legitimacy and proper domains of these types of explanation. They still raise problems in contemporary biology and psychology. The modern debates have progressed considerably from the earlier ones, although continuities do exist.

1 Goals

Aristotle's views about the domain of striving that is present in nature were challenged during the Renaissance. Aristotle held that goals were 'final causes', that inanimate things seek natural places or states which are proper to their kind, and that growth and development in living things is directed towards the attainment of maturity.

The term 'final cause' misled some commentators, who assumed that a final cause is an efficient cause that comes after its effect. This could not have been Aristotle's view. Aristotle believed that trees grow leaves in order to protect their fruit (*Physics:* 199a 26-9), but he recognized that the fruit is not always successfully protected. If birds eat the fruit, and hence the final cause fails to come about, this fact in no way undermines the teleological explanation. If he had meant that fruit-protection was an efficient cause working backwards in time, the failure to come about would undercut the efficient causal explanation. A final cause, for Aristotle, is a 'that for the sake of which' (see Aristotle §9).

Still, there were other objections to his explaining the movements of inorganic bodies by ascribing goals to them. Francis Bacon, Galileo and Newton eschewed such explanations on the grounds that they were entirely speculative and otiose. First, the alleged striving could not be identified independently of the changes that actually occurred to the body, nor could its goal be identified - the hypothesis was untestable. Second, the hypothesis was unnecessary, at least in the fields of mechanics and dynamics, since a complete explanation could be provided in terms of antecedent causes and the laws of motion. As Bacon (1623 III: ch. 5) put it, 'Inquiry into final causes is sterile, and, like a virgin consecrated to God, produces nothing'.

Modern science does not sanction the ascription of goals or strivings to inanimate objects, except possibly to such artefacts as guided missiles, autonomous robots, and mechanical searching devices, which were first designed in the 1940s. But here the goal-talk is perhaps only 'as if' (Woodfield 1976: ch. 11).

In the life sciences, however, it is accepted that human beings and animals *do* strive after goals. The conviction that we are intentional agents is central to our self-image and to society. Moreover, animal and human goals can be identified in advance of the behaviour that they explain. The hypothesis that an animal is striving for food, for example, can be tested experimentally. So it is not true that goal-explanations are *in principle* vacuous.

Whether plants strive is, perhaps, unclear. Although we speak as if they did ('The flower turned in order to face the sun' and so on), such locutions may be merely a hangover from an Aristotelian tradition. They survive because we find them picturesque or convenient. In late-twentieth-century biology, vitalistic teleological theories of growth and development are not thought to be respectable, even though such processes cannot quite be explained in wholly physico-chemical terms (see Vitalism).

Are goal-explanations restricted, then, to the domain of intentional behaviour performed by intelligent organisms? The central case is surely that of the animate agent, conscious of what it wants, sensitive to information about its environment and able to represent alternative plans to itself. If goals always involve desires, beliefs and other mental states, then intrinsic teleological explanations are a species of mentalistic explanation. The main problem that arises next is to provide a satisfactory account of intentionality (see Intentionality).

Several philosophers in the twentieth century have tried to make room for a distinctive form of goal-explanation which is not necessarily mentalistic (Braithwaite 1953; Nagel 1961; Taylor 1964; Wright 1976). Such theories may be viewed as broadly Aristotelian in the sense that they locate striving in activity which exhibits a distinctive pattern or causal structure.

2 Functions

Aristotle maintained that if an item *X* is a part of a system *S* in which *X* performs a characteristic activity that benefits *S*, then *X* exists and acts for the sake of *S*. *S* might be a living organism or something bigger, such as a bee-colony, an ecosystem or even the world as a whole. The fact that *X* serves a function for *S* is supposed to explain why *X* is present in *S*. Aristotle's doctrine was naturalistic in the sense that it did not postulate a supernatural designer, but it was not wholly naturalistic, since it employed the notion of *benefiting*. The main problem with extrinsic teleological explanations in biology is to see precisely how they work.

Even supposing that it is a 'fact' that *X* does good to a bigger system *S*, that fact alone is insufficient to account for *X*'s existence. Some additional premise or principle seems to be required. For example, if nature had been designed and created by a benevolent and omnipotent God, the existence of *X* in *S* would be explicable in terms of God's wishes, beliefs and creative acts. This form of functional explanation has a familiar logic: we use such explanations when giving the reasoning that leads human beings to design and produce useful artefacts. By supplementing the explanation in this way, we present extrinsic teleology as being derivative upon the intrinsic teleology of the designer (see God, arguments for the existence of §4). This solution is unsatisfactory, however, since neither biologists nor laypeople feel that the validity of 'natural function' explanations is dependent upon any theological assumptions. Either the explanations have some other form, then, or they are not genuine explanations at all.

In 1859, Darwin's theory of evolution by natural selection showed how harmonious systems could have arisen naturally, without the need for a designer. Darwin's theory explains the existence of *X* in *S* as the outcome of a gradual process. Ancestors of *S* who possessed parts similar to *X* survived and reproduced more successfully than their relatives who lacked parts similar to *X*, and these ancestors reproduced true to form (their offspring had organs like *X*, including *S* who has *X*).

Darwin made the designer-hypothesis redundant. Was his theory anti-teleological? Darwin took it as a datum that biological parts and characteristics which have survived the selection process are normally useful for their owners; his theory asserted that they persisted *because* they were useful. This looks like a vindication of Aristotelian extrinsic teleology. Upon further reflection, however, it hardly amounts to a ringing endorsement since Darwin's theory can be stated without employing the term 'function' or any teleological language at all (see Darwin, C.R.; Evolution, theory of).

Contemporary philosophers separate into two camps on the question of the logic of functional explanations in biology. The 'naturalistic revisionists' *redefine* the concept of function in terms of the causal-historical Darwinian selection hypothesis. They keep the old teleological language but sanitize it (Wright 1976; Millikan 1984).The other camp consists of 'semantic conservationists' who maintain that natural functionality cannot be *defined* in terms of Darwin's theory (Woodfield 1976). On the latter view, talk of natural functions is committed to assumptions about benefit and harmony and goodness that are extraneous to science and probably perspective-dependent. This view implies that functional explanations are still potentially problematic.

It is possible to maintain that functional explanations of undesigned phenomena have some scientific merit even if they are not wholly objective. Kant (1790) argues that the attribution of natural functions to organs is heuristic: it helps to systematize our knowledge of organisms and generates further 'how?' questions. Kant's sophisticated defence does not license the unbridled attribution of good consequences to everything in nature - a tendency ridiculed earlier by Voltaire (1758) (see Kant, I. §13).

In the 1980s, naturalistic revisionists, notably Millikan (1984), began to exploit the Darwinian account of functionality as a tool for solving the problem of intentionality. The key insight is that desires, intentions and other mental states with intentional contents can themselves be seen as biologically adaptive states or as the products of mechanisms that are adaptive. The hope is to provide a naturalistic reduction of intentionality. This ambitious

research-programme would make extrinsic teleology more fundamental than intrinsic teleology.

After more than two millennia of debates since Aristotle, teleology continues to provoke lively controversy among analytic philosophers.

Telesio, Bernardino (1509-88)

Bernardino Telesio was a philosopher from southern Italy. He was one of the Renaissance philosophers who developed a new philosophy of nature: his most important book was called De rerum natura iuxta propria principia (On the Nature of Things According to Their Own Principles). Telesio approached natural philosophy empirically, and regarded it as a separate field of study from theology and metaphysics. He believed that all natural beings were animate; and, by arguing that the two general principles of heat and cold affected the whole universe, he resisted the Aristotelian division between the corruptible earth and the eternal heavens. However, despite his apparent anti-Aristotelianism and his sympathy for the Presocratics, Telesio owed much to Aristotle, and tried to transform rather than destroy Aristotle's work. Telesio became the head of a Calabrian school, and was influential and widely discussed in his own time. Francesco Patrizi criticized him, but with respect; Tommaso Campanella followed him in his early works; and Thomas Hobbes drew inspiration from him.

1 Life

Not much is known about the circumstances of Telesio's life, the 'man of one book' who was entirely devoted to the development of a new philosophy of nature and who died when he had completed his task. He was born at Cosenza in southern Italy, the first of eight children in a poor but noble family. At an early age he followed his uncle and teacher Antonio Telesio to the north, where his uncle taught Latin and Greek (first in Milan and then in Venice). He attended the University of Padua, which was well known throughout Europe, studying mathematics with Federico Delfino and philosophy with the Aristotelian Vincenzo Maggi (or Madius). He probably received his doctorate in 1535, after which he returned to his native province and retired to a monastery to work on his own philosophical projects. In 1552 he married a noble widow, who died eight years later. In 1565 Pope Pius IV offered Telesio the archbishopric of Cosenza, but he refused, and in 1576 he also refused Pope Gregory XIII's invitation to teach his philosophy in Rome. Despite his reluctance to enter public life, from 1547 on he made it known that he was working on a philosophy which would destroy the tyranny of Aristotle. In 1563 he travelled to Brescia, to discuss his ideas with his old friend and teacher, Maggi. With Maggi's approval, he published the first version of his natural philosophy, *De natura iuxta propria principia (On Nature According to Its Own Principles)* in 1565. Five years later, he published a revised second version with the definitive title *De rerum natura iuxta propria principia (On the Nature of Things According to their Own Principles)*, as well as three minor treatises, containing additional material. These works met with the critical approval of Francesco Patrizi, who was to develop his own views in his *Nova de universis philosophia (New Philosophy of Universes)* (1591). In 1586 Telesio published the final version of his treatise, now enlarged from two books to nine. He founded the *Accademia Cosentina* in Cosenza in order to promote the study of nature according to Telesio's principles, and it was in Cosenza that he died in 1588.

2 Approach to nature

Telesio's initial claim is of fundamental importance for his new philosophy of nature. He said that, in contrast to his predecessors, he would not rely on abstract principles invented by human reason, but would content himself with those concrete aspects of nature which are given in sense perception, and with what can be inferred from their similitudes. He did not wish to make the false claim that he was the first to deal with nature in an empirical manner, nor, contrary to Patrizi's accusation, did he pretend to be able to philosophize on the basis of mere sense perception. As he makes clear in the ninth and tenth chapters of the first book, he meant that he would refuse to explain what is perceived in nature in terms of what lies beyond the world of sensible experience, and hence is properly a metaphysical concern. Thus from the very beginning he postulated that natural philosophy should be developed as an autonomous science, independent of metaphysics and theology, and that nature itself should be considered as an autonomous structure, rationally designed to preserve itself eternally according to its own principles (*iuxta propria principia*).

3 The principles and structure of the universe

When Telesio began to determine the first principles of nature itself, he simply said that it is obvious to the senses that heat and cold are the most active general principles which constitute all natural beings, and offered no other justifications for this opinion. Patrizi and many scholars after him objected that these were the principles of

Parmenides, so Telesio was not original, nor were his principles based on sense perception. However, one should not forget that for Aristotle natural beings (in so far as they are sensible bodies) are constituted by the most basic sensible, that is tangible, qualities (hot, cold, wet and dry). Of these primary qualities, heat and cold are defined as the active ones. Thus in the basically Aristotelian world of sixteenth-century thought, Telesio's identification of the first sensible active principles with heat and cold seemed quite natural.

Telesio's originality lies in his use of the two principles. He did not regard them as being primary qualities or forms of prime matter, but as incorporeal substances which are received by the third passive principle, the corporeal mass (*moles*) on which they operate through condensation and rarefaction. Heat, since it is white, bright, extremely rarefied and in rapid continuous motion, is concentrated in the sun and the heavens. Cold, on the other hand, since it is black, dark, dense and totally unmoved, is concentrated in the earth. Since both are endowed with the capacity to regenerate and multiply themselves, to spread out in all directions, and to occupy and transform the whole mass according to their own nature, they fight each other. In so doing, they constitute the whole variety of natural beings through a continuous process of self-organization.

This general model of the universe has some interesting consequences from the perspective of the modern concept of nature. By locating the centre of one of the active principles, heat, in the sun and the heavens, Telesio identifies elementary heat, present in fire, with heavenly warmth, operating through the sun. In the Aristotelian tradition these were regarded as being different, and nature, which for centuries had been divided into the corruptible earthly sphere and the eternal heavenly natures, was thus unified by Telesio. Moreover, since it would obviously be difficult to derive space and time from his principles of nature, Telesio taught that time was not identical with the motion of bodies, and that space was not identical with the place (*locus*) formed by the surface of bodies. Rather, both are absolute entities, presupposed by the operations of the active principles. As a result, there is no doubt that a vacuum is possible, even though bodies, thanks to a certain delight in contact with one another, try to avoid it (see Cosmology §1).

4 The soul

When the active principles operate, they do so in order to overthrow their opposite and to preserve themselves. In order to be able to do this, they need the capacity to perceive both favourable and unfavourable operations, and to discriminate between them. Thus sense perception is as basic as the active principles themselves, for without it the whole process of interaction and self-organization would not work. If sense perception is linked to having a soul, as in the Aristotelian tradition, the active principles must be animate, and as a result all natural beings that are constituted by these principles and that are active in self-preservation must also be animate.

Thanks to the general animation of natural beings in so far as they are natural, even the lowest natural entities are raised to the dignity of sense perception and discrimination; and indeed the whole cosmos seems to be regarded as a living being. The capacities of sense perception and discrimination come to be seen as the most basic and most common natural qualities, which provide the general conditions for any natural process as such, even the most simple and mechanical ones such as rarefaction and condensation through heat and cold. However, when we arrive at more sophisticated organizations in the hierarchy of natural beings, such as those of plants, animals and human beings, it is only natural that their powers of perception and discrimination are also more sophisticated. Sense perception, cognition and judgment as found in human beings differ from the faculties of the souls of other natural beings only in their higher perfection, and it is tempting to suggest that for Telesio the very development of a philosophy of nature is just the natural operation of the most perfect natural being in its striving for self-preservation (see Soul, nature and immortality of the).

5 The immortal intellect of human beings

The soul which enables human beings, the most perfect of natural beings, to fulfil their specific operations, is diffused through their bodies in the form of spirits (*spiritus*) or highly rarefied matter, and since human spirits differ from animal spirits only in the degree of rarefaction, the perfection of human beings is based on this difference alone. As a result it seems puzzling that in his eighth book, Telesio introduces a second type of intellect which is immaterial and immortal. This intellect is created by God and infused into human beings so that they can contemplate and know divine and eternal objects in addition to sense objects, and so that they can strive for the preservation of their supernatural, incorporeal self. It has been supposed that this divine intellect, which seems

inconsistent with Telesio's pure natural philosophy, was merely a prudent sign of submission to the church, or else a proof that Telesio was conscious of the indispensability of metaphysics. However, before the general separation of physics and metaphysics developed in sixteenth-century Aristotelianism, the autonomy of natural philosophy was not thought to be affected by the admission of such metaphysical notions as an intellect that enters the body from outside (the so-called *nous thyrathen*) or of a second end for human beings (as discussed in Aristotelian ethics) beyond the purely natural one of self-preservation. Telesio may well have placed himself in this tradition.

Temple, William (1881-1944)

William Temple was concerned to unite personal Christian religion and social action, finding in the doctrine of the incarnation of God in Jesus Christ the basis for human dignity. He held that while the universe long existed without finite minds, and finite thought has its origin in the functioning of physical organisms, thought transcends its origins, creating ideas not occasioned by or referring to its physical environment, and purposively affecting that environment. Our capacities to seek truth, appreciate beauty and recognize duty are best explained by a purposive creative Mind using physical creation to bring other minds into existence. Created minds continually depend for their existence on God's continuing to sustain them.

Born in 1881, the son of an Archbishop of Canterbury, William Temple entered the Church of England and rose to the positions of Bishop of Manchester and then Archbishop of York before himself becoming Archbishop of Canterbury in 1942, at the height of the Second World War. He died in 1944.

An Anglican Platonist, Temple was concerned with overcoming the problems of evil and embracing good within a Christian context, and sought to reconcile the existence of evil and the existence of God. While it is the nature of evil to be against the will of God, monotheism, in order to retain plausibility, must be able not merely to show that the propositions 'God exists' and 'There is evil' are logically consistent, but to explain how God can use evil to further a providential plan. A basic theme in Temple's *Nature, Man, and God* (1934) is that what is wanted is some ground for the belief that the occurrence of evil is an element in the total good. Temple endeavoured to provide this by arguing that human beings are so created as to act in terms of what they believe their good to be. Creatures such as ourselves, in whom thought is rooted in a physiological organism, naturally tend to find their apparent good in what brings gratification, comfort and security. While not strictly necessary, that such creatures should sin is 'too probable not to happen'. Thus if thought is to arise from material conditions, it is natural (that is, easily explicable and to be expected) that those in whom it arises should have a bent towards self-concern and selfishness. This leads us to identify as our good conditions that are not our true good; we tend to a self-concern unwise even as regards our own interests. From this oversized self-concern arise individual and social evils.

Perhaps, Temple suggested, the conditions that involve the suffering of nonhuman animals are those which in humans give opportunity for forbearance, fortitude, courage, compassion and the like, presaging human moral life in the way that nonhuman animal consciousness prepares the way for human thought. In any case, since our actual good includes our coming to recognize a worth in our neighbours equal to that which we find in ourselves, our bent to selfishness precludes our identifying and successfully embracing our real good. We are unable on our own to correct this situation. While the successes of our searches for truth, beauty and goodness may not be ignored or repudiated, we can embrace our own good only by help from resources beyond our own. We find that self-centredness is sometimes temporarily and partially overcome by unselfish love.

If it is to be sufficiently conquered for us firmly to identify and seek our genuine good, we must ourselves be objects of an unselfish love that enables us to make others the object of an unselfish love of our own. Philosophical reflection and our knowledge of ourselves can make clear what is needed, but cannot say whether it is available to us. Temple endeavoured, then, to develop a defensible monotheism which would explain human thought and leave as little of the puzzle of human existence philosophically unilluminated as possible. He contended that when this is done, there remains a missing piece whose shape exactly corresponds to that of the Christian gospel, which proclaims that God became incarnate in Jesus Christ, whose exemplary life, atoning death, and resurrection from the dead for our justification manifested a costly unselfish love on the part of a God who can empower us to achieve our actual good. Temple claimed that this position is not refuted by the existence of evil, quoting as expressing his own position a passage from Bosanquet's *The Principle of Individuality and Value*:

> For a Christianity which has the courage of its opinions the idea of victory involves the idea of the Fall, and the answer [to the question of whether a world with both sin and divine atonement is better than one without sin] would be that the scheme of salvation, involving finiteness and sin, seem essential to the nature of God and the perfection of the universe.

(Bosanquet 1912: 425)

Temple was important in Anglican Christianity's effort to relate its worldview to increasing scientific knowledge and contemporary social problems without abandoning its distinctive traditional content.

Tennant, Frederick Robert (1866-1957)

A prolific writer on religion and philosophical theology, Tennant produced book-length studies of topics as diverse as the philosophy of science and the origin of sin. He is best known by philosophers for his two-volume Philosophical Theology (1928, 1930), which offered the most sophisticated version then available of the argument from design for the existence of God. Tennant's philosophical legacy consists primarily in the influence his methodology has exerted on later philosophical theologians.

F.R. Tennant received his graduate education at Cambridge University and spent his academic career there, as a fellow of Trinity College and, eventually, as a university lecturer in philosophy of religion. His specifically theological works include three studies of the concepts of sin and the Fall. His philosophical works include monographs on the concept of miracles and the nature of belief.

Tennant's most influential contribution to philosophy, the richly detailed *Philosophical Theology* (1928, 1930), employs his thinking on topics in the philosophy of empirical science to produce an intricate version of the argument from design for the existence of God (see God, arguments for the existence of §§4-5). Recognizing the force of Hume's attack on traditional forms of the argument (see Hume, D. §6), Tennant proposes a deliberately weakened conclusion: 'The attributes to be ascribed to God will be such as empirical facts and their sufficient explanation indicate or require' (1930: 78), a list of attributes that, he concedes, may fall well short of the elaborate list theists have traditionally ascribed to God.

Like previous versions of the design argument, Tennant's version claims only to render its conclusion probable, where the probability in question is inductive, rather than statistical or logical. Inductive probability, the sort of probability that empirical evidence is supposed to lend to a scientific hypothesis, forms the basis, according to Tennant, of empirical reasoning in both science and everyday life. The 'multitude of interwoven adaptations by which the world is constituted a theatre of life, intelligence, and morality', he argues, makes inductively probable the existence of a purposive, intelligent creator (1930: 121).

Tennant concedes that naturalistic accounts such as evolutionary theory may explain each of the individual adaptations he cites, but he insists that in this case the whole exceeds the sum of its parts: naturalism can explain each adaptation but not their totality. Here Tennant anticipates the kind of 'cumulative case' arguments for theism offered by Basil Mitchell (1973) and others: while no single piece of evidence rationally compels belief in God, the pieces are said to reinforce one another in such a way that theism becomes inductively probable. Critics have insisted on focusing on the cogency of each piece of theistic evidence - reminding us that, in the end, ten leaky buckets hold no more water than one.

Tennant's design argument has encountered other, more specific objections. Some critics, such as John Hick (1966) and D.H. Mellor (1968), have objected to Tennant's particular use of probability theory and have challenged the relevance of any kind of probabilistic reasoning to theistic belief. They give Tennant credit for recognizing that statistical and logical probability apply only dubiously to the question of how likely it is that the entire universe arose by chance. But they charge him with appealing to a notion of inductive probability that he fails to explain rigorously and with using even inductive probability in a fallacious way. Others, including D.L. Scudder (1940), have faulted Tennant for failing to treat religious experiences either as a fundamental basis for religious belief or as further data in support of the theistic hypothesis.

These objections have since been addressed by a number of philosophers who, because of Tennant's apparent influence on them, may be counted among his successors, including Mitchell, George Schlesinger and especially Richard Swinburne. Like Tennant, they have treated theism as in some sense a scientific hypothesis to be tested by the usual inductive methods. Swinburne's contributions to philosophical theology have sought to apply more sophisticated versions of probability theory to the question of God's existence, a methodological improvement on Tennant's work but squarely in the same spirit. Swinburne has also tried to meet another objection to Tennant's argument by making the widespread existence of religious experiences an explicit part of the case for theism (see Religious experience §2). Although cited less frequently with each generation, Tennant's writings stand at the head of a steady stream of probabilistic arguments from design.

Tense and temporal logic

A special kind of logic is needed to represent the valid kinds of arguments involving tensed sentences. The first significant presentation of a tense logic appeared in Prior (1957). Sentential tense logic, in its simplest form, adds to classical sentential logic two tense operators, P and F. The basic idea is to analyse past and future tenses in terms of prefixes 'It was true that' and 'It will be true that', attached to present-tensed sentences. (Present-tensed sentences do not need present tense operators, since 'It is true that Jane is walking' is equivalent to 'Jane is walking'.) Translating the symbols into English is merely a preliminary to a semantics for tense logic; we may translate 'P' as 'it was true that' but we still have the question of the meaning of 'it was true that'. There are at least two versions of the tensed theory of time - the minimalist version and the maximalist version - that can be used for the interpretation of the tense logic symbols.

The minimalist version implies that there are no past or future particulars, and thus no things or events that have properties of pastness or futurity. What exists are the things, with their properties and relations, that can be mentioned in certain present-tensed sentences. If 'Jane is walking' is true, then there is a thing, Jane, which possesses the property of walking. 'Socrates was discoursing', even if true, does not contain a name that refers to a past thing, Socrates, since there are no past things. The ontological commitments of past and future tensed sentences are merely to propositions, which are sentence-like abstract objects that are the meanings or senses of sentences. 'Socrates was discoursing' merely commits us to the proposition expressed by the sentence 'It was true that Socrates is discoursing'.

The maximalist tensed theory of time, by contrast, implies that there are past, present and future things and events; that past items possess the property of pastness, present items possess the property of presentness, and future items possess the property of being future. 'Socrates was discoursing' involves a reference to a past thing, Socrates, and implies that the event of Socrates discoursing has the property of being past.

1 *De dicto* and *de re* occurrences of tenses

If a tense occurs *de dicto*, then the tensed expression ascribes a temporal property to a 'dictum' (proposition). 'It will be true that the sun is exploding' involves a *de dicto* occurrence of 'will be': the property 'having future truth' is ascribed to the proposition expressed by 'The sun is exploding'. If a tense occurs *de re*, then the tensed expression ascribes a property to a thing or event. The sentence 'The sun will explode' involves a *de re* use of 'will' since the tensed expression 'will explode' ascribes the temporal property 'exploding in the future' to the sun (see De re/de dicto).

The tense logic favoured by minimalists is based on the idea that all occurrences of past and future tenses are *de dicto* (even though some might appear to be *de re*) and therefore can be represented by sentential operators, such as 'it was true that'. According to this theory, the sentence 'The sun will explode' only appears to ascribe a temporal property to the sun; in reality it ascribes a temporal property to a proposition. 'The sun will explode' means the same as 'It will be true that the sun is exploding'.

2 Quantified tense logic

The *de re*/*de dicto* distinction also appears in the different approaches of the maximalist and minimalist theorists to the syntax of quantified tense logic. Quantified tense logic may be formulated in at least two ways. One way is based on the idea that quantifiers ('any', 'some') occur only within the scope of tense operators. In the sentence 'Some thing will fly to Mars', the quantifier 'some' does not occur within the scope of a tense operator. But it does in 'It will be true that some thing flies to Mars'.

The minimalist theory implies that quantification over past or future particulars should occur only in the scope of tense operators. Consider the sentence 'Some person did exist who wrote *The Republic*'. The minimalist will take this to express the same proposition as 'It was true that some person is writing *The Republic*', which has the symbolic form $P(\exists x)Gx$. The quantified expression 'some person' occurs within the scope of 'it was true that'; this implies that 'some person' does not now refer to anything (there are no past people for it to refer to), but used to refer to something; to a person that existed at the time the proposition was true.

The minimalist assumption that temporal properties should be ascribed only to propositions also appears in the treatment of quantification over present particulars. The sentence ‘Some person is presently writing a book’ is not interpreted as ascribing the temporal property ‘presently writing a book’ to a person. Rather, it is taken to mean ‘It is true that some person is writing a book’, which would involve a present tense operator. This sentence ascribes the property of being presently true to the proposition ‘Some person is writing a book’. This minimalist interpretation of quantification is exemplified in A.N. Prior’s remark in *Past, Present and Future*: ‘a quantifier preceding any such operator [any tense operator] is naturally taken to be governed by the ‘‘It is the case that-’’, which is prefixable to anything we say, and therefore to range over what *now* exists’ (1967: 144; emphasis added).

The maximalist tensed theory of time, by contrast, allows quantification over past, present or future particulars to occur outside the scope of tense operators. The expression ‘some person’ in the sentence ‘Some person existed who wrote *The Republic*’ quantifies over all past, present and future persons. This reflects the assumption that some people exemplify pastness, some, presentness and some, futurity.

The maximalist theory implies a *de re* use of the symbols *P* and *F*. Traditional tense logic (following Prior) uses *P* and *F* only in a *de dicto* manner, to mean ‘it was true that’ or ‘it will be true that’. But in an expression of the form $(\exists x)Px$, ‘*P*’ does not mean ‘it was true that’ but stands for a property of *x*; the property of pastness. The expression translates as ‘Something is past’. Since ‘*P*’ here is not used as a sentential operator, but as a predicate, this should be marked in our symbolic notation. We may put an asterisk after *P* to mark the use of this symbol as a predicate. Thus we should say $(\exists x)P^{*}x$.

The symbol *P* is also used in a *de re* manner in $(\exists x)[PG]x$. Here the symbol *P* operates on the predicate *G* to form a more complex predicate. This translates as ‘Something exemplifies past *G*-ness’ or, equivalently, ‘Something’s exemplification of *G* has pastness’. To mark this distinctive use of *P* as a predicate operator, we can underline *P*, so that we say $(\exists x)[\underline{P}G]x$.

According to the maximalist tensed theory of time, an adequate quantified tense logic must include *P* (a sentential operator), P^{*} (a predicate) *and* $\underline{P}$ (a predicate operator). Given these symbolic distinctions, maximalists can allow that *P* is used only *de dicto*.

The distinction between *de dicto* and *de re* occurrences of tense logic symbols is partly analogous to the same distinction in modal logic. The box is used *de dicto* in $\Box A$, which means ‘It is necessarily true that *A*’, where *A* is some proposition. The box is used *de re* in $(\exists x)\Box Fx$, which means that some thing is necessarily *F*.

3 A paradox for the minimalist theory

The minimalist tensed theory of time is false if there is a true sentence which a minimalist interpretation turns into a logical contradiction. The maximalist may claim there are such sentences. For example, the maximalist may claim that 10 billion years ago, before any intelligent organisms evolved, there was no language and thus no truths or falsehoods. Consider the sentence ‘It is logically possible that there was a time *t* at which there were no truths’. If ‘there was’ and ‘there were’ are *de dicto* occurrences of tense, then this sentence says the same as ‘It is logically possible that it was true at time *t* that there are no truths’, which is a logical contradiction. The sentence must instead be taken to mean that it is logically possible that some time *t* exemplifies both pastness and having contained no truths.

The minimalist may counter that Platonic realism is true and thus that it is necessary that there be truths at all times. The maximalist may respond that the truth of Platonic realism and the falsity of nominalism are determined by metaphysics, not by formal logic. ‘Platonic realism is true’ is not a logical theorem and ‘There were no truths 10 billion years ago’ is not a logical contradiction. Thus a formal logic that implies these sentences are logical truths or falsehoods is not in fact valid.

The minimalist may have a second response, namely that the sentence ‘It is logically possible that it was true at time *t* that there are no truths’ does not imply the existence of a truth at time *t*. The tense operator ‘it was true at time *t* that’ does not imply that the proposition ‘There are no truths’ *existed* at time *t*. Rather, it implies merely that the time at which the (present tense) proposition should be evaluated for truth or falsity is the past time *t*, and that the proposition possesses truth at this time. The maximalist will say that this response depends on the intelligibility of the thesis that the proposition ‘There are no truths’ possesses at time *t* the property of being true and yet does

not exist at this time. How can a nonexistent (at time *t*) proposition possess a property (at time *t*)? It is debatable whether the maximalist can derive a contradiction from the minimalist theory that some propositions do not exist at some of the times at which they exemplify the property of being true.

A.N. Prior, who presented the first significant tense logic (1957), defends a minimalist tensed theory of time (1967) and is the most influential opponent of the maximalist theory and *de re* occurrences of tenses. Prior's critical stance is analogous to Quine's position regarding quantified modal logic. Prior found problematic *de re* occurrences of 'was' and 'will be', objecting to the realism about properties of pastness, futurity and presentness associated with constructions of the form $(\exists x)P^*x$ (something exemplifies 'being past'). (Similarly, Quine found problematic *de re* occurrences of 'must be', and objected to the realism about essential properties associated with constructions of the form $(\exists x)\Box Fx$ (something exemplifies 'being necessarily *F*').)

In Prior's case, the rejection of the realist position is in part due to his categorization of pastness, presentness and futurity as *activities*. Prior suggests that these temporal properties of events (if there were such properties) belong in the same ontological category as activities done by things. He denies that there are *events* 'momentarily doing something called "being present" and then doing something else called "being past" for much longer' (1967: 18). Prior may be interpreted as suggesting that it is a mistake to categorize presentness and pastness along with such activities as running or talking, and then say that presentness and pastness (if there are such properties) are activities performed not by things, but by events.

The realist may grant this point, but argue that presentness and pastness need not be categorized as activities performed by events. 'Events possess temporal properties of being present or being past or being future' does not entail 'Presentness, pastness and futurity are activities done by events'. These temporal properties, like such properties as existence or self-identity, are unusual kinds of properties and should be placed in an ontological category by themselves.

4 Do *de dicto* occurrences imply *de re* occurrences?

The idea that all occurrences of tenses are *de dicto* leads to a minimalist semantic interpretation of such present-tensed sentences as 'The moon is bright'. According to this interpretation, this sentence does not report that an event, the moon's exemplification of brightness, has presentness. There is no first-order property of presentness and no event; there is only the thing, the moon, exemplifying brightness. The maximalist may argue that problems with this interpretation arise as soon as we ask *when* the moon exemplifies brightness. If 'exemplify' is tenseless, then there is no answer, and the analysis is faulty, since the present tense sentence 'The moon is bright' implies the moon is now exemplifying brightness. But if 'exemplify' is present-tensed, then we must ask what the semantic content of the present-tensed aspect of this verb is. The present tense must have some semantic content or meaning, since it conveys temporal information and is not a meaningless syntactic device such as 'It' in 'It is raining'. Further, to what ontological category does this temporal information belong?

According to the minimalist *de dicto* theory of tenses, the semantic category of the present tense is 'sentential operator' (the present tense has the same semantic content as 'it is true that') and the relevant ontological category is 'second-order property'; the present tense ascribes the property of 'being presently true' to a proposition. This theory implies that if the sentence 'The moon is bright' is true, we are ontologically committed to (1) the proposition, 'The moon is bright', (2) the proposition's exemplification of the property, 'being presently true', (3) the thing, the moon, and (4) this thing's exemplifying the property of brightness. The maximalist may object that 'exemplifying' in (4) is present-tensed, reflecting the fact that the thing presently exemplifies a property of brightness. According to the maximalist, the thing's *present* exemplification of brightness (rather than a timeless, past or future exemplification of brightness) is the ground for the proposition's being presently true.

5 Past and future existents

According to the minimalist theory, the ontological commitments of the sentence 'Plato had been alive' are merely the proposition 'Plato is alive' and the proposition's property of having been true. The maximalist may grant that these are the only ontological commitments if we accept the coherentist or eliminativist theory of truth. But the maximalist accepts the correspondence theory of truth and argues that this theory requires further ontological commitments. 'Plato had been alive' commits us to a past thing, namely, Plato, and a past event or state, namely,

Plato's being alive. 'Correspondence' is a symmetrical property. (It is a dyadic property and thus a relation.) If the proposition 'Plato is alive' had been true in the past, then this proposition exemplifies past correspondence to Plato's being alive. Since correspondence is a symmetrical relation, this implies that some event, Plato's being alive, exemplifies past correspondence to the proposition 'Plato is alive'. The reason this event exemplifies past correspondence is that the event exemplifies pastness. Since Plato is a part of this past event, Plato exemplifies pastness. It follows, the maximalist concludes, that some events and things are past.

This maximalist conclusion implies that the temporal property 'pastness' is *de re*, since it is a property of a thing, Plato, and of an event, Plato's being alive. There was something, Plato, over which we can now quantify; it is the case that $(\exists x)P^{*}x$. The same results hold for propositions that will correspond to something exemplifying some property.

One concern that minimalists have about the maximalist interpretation of tense logic pertains to the maximalists' thesis that past or future things or events *presently* possess properties. Consider the formula $(\exists x)P^{*}x$. Does not $(\exists x)$ in this formula convey that there presently exists an *x*? And does not $P^{*}x$ mean that this *x* is not presently existing but is past? If so (the minimalist may argue), the symbolic representation of *de re* occurrences of tenses turns true sentences into contradictions.

But the maximalist may respond that $(\exists x)$ has at least three different meanings in an adequate quantified tense logic, corresponding to three different senses of 'exists'. If 'exists' is present-tensed, it can have one of two senses. In one sense, it is logically equivalent to 'has the property of presentness', so that 'Mount Everest exists' is logically equivalent to 'Mount Everest has the property of presentness'. In the second sense, it can be equivalent to 'presently possesses some property'. Something that is past or future exists in this present-tensed sense, since if something is now past, it presently possesses the property of pastness. If 'exists' is tenseless, it is in effect disjunctively tensed; that is, it is equivalent to 'has existed, exists or will exist', where the middle 'exists' is equivalent to 'has the property of presentness'. If we say 'Socrates exists', we mean that Socrates either has existed or exists (presently) or will exist.

The maximalist argues that this threefold distinction shows that there is no logical difficulty in the idea that some past or future item presently possesses a property. The maximalist may note that 'Some past thing presently has the polyadic property of being remembered' is not a logical contradiction. Nor can it be turned into a logical contradiction by substitution of synonyms. Indeed, the maximalist continues, an analysis of the concept expressed by 'remembering' implies that the minimalist theory is false. Remembering is not a relation between a present person and a present image. If it were such a relation, it would follow that what is being remembered is in every case an image that exists simultaneously with the act of remembering. But this is an analytic contradiction, since it is a part of the logic of 'remembers' that what is remembered exists earlier than the act of remembering. Remembering a thing is a three-termed relation: a person remembers a past thing by forming a present image of that past thing. The 'of' expresses the relation in which the present image stands to the past thing.

The maximalist may elaborate that there will appear to be a difficulty about non-present items presently possessing properties if one is mistaken about the sorts of properties a past or future item can possess. Since Plato does not now exist, Plato cannot now possess the properties of walking, breathing, writing, thinking and so on. These properties can only be possessed by Plato when he is present. But Plato now possesses the properties of being past, of being referred to by the name 'Plato', of being thought about, of being earlier in time than Descartes, and so on. Further, Plato now possesses the properties of having walked, having written *The Republic*, having been alive, having been human, and so on, all of which can be expressed in a symbolic notation of the form $(\exists x)[\underline{P}G]x$, where $(\exists x)$ can be taken as tenseless or as present-tensed in the second sense distinguished by the maximalist.

Tertullian, Quintus Septimus Florens (*c.* AD 160-*c.* AD 220)

Tertullian was the first Christian theological author to write in Latin, and is responsible for initiating the Latin vocabulary of Christian theology, including such important terms as persona *(person) and* substantia *(substance). His early works, including the Apologeticum, refute pagan misconceptions about Christianity and argue on philosophical and juridical grounds for religious freedom. His later theological treatises, such as De anima (On the Soul) and Adversus Marcionem (Against Marcion) reflect Tertullian's adherence, in about* AD *205-6, to Montanism, a Christian sect which emphasized asceticism, apocalypticism and prophecy. These lengthy works represent an effort to oppose those forms of Christianity that sought to ally themselves with Platonism, such as Gnosticism. After these defences of apocalyptic Christianity, Tertullian fades from historical view around* AD *220, leaving a legacy of charismatic truculence.*

Tertullian was born about AD 160 in Carthage. His family was pagan and his early education included rhetoric and law, together with some philosophy. Tertullian practised law at Rome until his conversion to Christianity around AD 193, after which he returned to Africa where he devoted himself to propagating his new faith and producing apologetical literature on its behalf.

Tertullian's lasting impact on the history of Western thought is a result of the brilliance of his rhetoric. His writings are highly individualistic: intense, pungent and paradoxical. They are full of striking aphorisms that have become famous in Western culture. Of the relationship of Christianity to reason and philosophy, he maintained 'What does Athens have to do with Jerusalem? What agreement is there between the Academy and the Church, between heretics and Christians?' (*De praescriptione haereticorum* 7) and of the incarnation: 'it is certain because impossible' (*De carne Christi* 5).

Tertullian was strongly opposed to the transcendentalism of earlier Christian apologists and Platonists (Justin Martyr, Theophilus, Irenaeus) and of the Gnostics (Marcion, Hermogenes, Valentinus). His ontology is Stoic in its origins. His major philosophical treatise is *De anima (On the Soul)*, an attempt to disprove the Platonic conception of a naturally immortal soul. For Tertullian, the soul is corporeal, a product of a 'soul-seed' transmitted at conception. According to Tertullian, the soul is a free material being whose continued existence depends upon its redemption by Christ and whose spiritual hope rests in its resurrection (see Soul, nature and immortality of the). By adopting this materialist psychology, Tertullian sought to associate Christianity with opponents of psychic pre-existence and transmigration. This was an act of deliberate philosophical positioning, setting the nascent Christian movement into alliance with Stoic and medical writers whose outlook on theology was materialistic.

Yet it is difficult to assess Tertullian's theological materialism. He insists that everything which exists is corporeal (*De carne Christi* 11) and that God is corporeal, albeit a 'spiritual' body (*Adversus Praxean* 7). This conflation of *spiritus* and *corpus* in God signals his unique character, since God alone is a perfect corporeal being, not produced by any other. However, God remains a substance distinct from other material entities, which are his products. His existence is known through them (*De resurrectione* 2-3). God is, however, understood by Tertullian to be at the extremity or outer surface of the cosmos, so that he is literally greater than all other things (*Adversus Praxean* 16). Thus, Tertullian draws on the Stoics for his attenuated materialist theology, but his precludes the Stoic tendency to assimilate God to the world. In insisting that God is *corpus*, Tertullian is unique among Patristic authors. His early treatise on Gnosticism, *Adversus Hermogenem (Against Hermogenes)*, attacks the common ancient theory that matter is eternal, and with it the 'demiurgic' view of God as the fashioner of order from disordered matter. Tertullian maintains instead that God, while himself a material spirit, is free from any constraint imposed by pre-existent matter, creating *ex nihilo* by his free will.

Finally, Tertullian contributed importantly to the Latin Christian definition of God as a 'trinity'; he is the first Latin author to employ the term *trinitas* in a technical sense (see Trinity). His formulation 'one substance, three persons' (*una substantia, tres personae*) became fixed in subsequent Latin theology. It was meant to capture the original unity of his material God, who is conceived as 'shooting forth' the Logos and the Spirit in a temporal process. The Logos is understood to exist before this act of generation within the Father's mind as a *ratio*, but to emerge subsequently as a distinct *persona* with the beginning of the cosmos. While Nicene orthodoxy would later reject these materialist and temporal implications, his innovative terminology would be adopted by Christian

orthodoxy.

Tertullian is thus an outrider in early Christian thought, a radical opponent of its developing Platonic mainstream. As such, he helps to show how different Christian theology might have been had its scriptural deposit been read through a materialist philosophical prism.

Testimony

Philosophical treatment of the problems posed by the concept of knowledge has been curiously blind to the role played by testimony in the accumulation and validation of knowledge or, for that matter, justified belief. This is all the more surprising, given that an enormous amount of what any individual can plausibly claim to know, whether in everyday affairs or in theoretical pursuits, is dependent in various ways upon what others have to say. The idea that someone can only really attain knowledge if they get it entirely by the use of their own resources provides a seductive ideal of autonomous knowledge that may help explain the way epistemologists have averted their gaze from the topic of testimony. But, unless they are prepared to limit the scope of knowledge dramatically, theorists who support this individualist ideal of autonomy need to explain how our wide-ranging reliance upon what we are told is consistent with it. Characteristically, those who consider the matter acknowledge the reliance, but seek to show that the individual cognizer can 'justify' dependence upon testimony by sole resort to the individual's resources of observation, memory and inference. Testimony is thus viewed as a second-order source of knowledge. But this reductionist project is subject to major difficulties, as can be seen in David Hume's version. It has problems with the way the proposed justification is structured, with its assumptions about language and with the way the individual's epistemic resources are already enmeshed with testimony. The success or failure of the reductionist project has significant implications for other areas of inquiry.

1 The epistemological background

Philosophy in the Western tradition, and beyond, has long enshrined a particular picture of the starting point and the task of epistemology. The task has principally been seen as trying to understand what sort of thing or goal knowledge is and thereby to distinguish it from counterfeit, inferior or merely different items such as superstition, opinion or belief. In pursuit of this, it became necessary to further contrast or identify knowledge with such notions as justified or reliable belief. Often the task was propelled by worries about (or enthusiasm for) scepticism, either total or partial. But equally, philosophers uninterested in the sceptical problem have attempted to distinguish knowledge from various pretenders to its title and to chart the interrelations of the various areas, types or sources of knowledge (see Epistemology, history of; Ryle, G.).

In all of this thinking about the nature and value of knowledge, however, the picture has persisted (except in the speculations of a handful of thinkers) of the subject doing the investigation as initially positioned in a state of cognitive isolation. This picture has endured in spite of the fact that the data to be accommodated and explained seem ill at ease with it. Such data include the fact that these cognizers unhesitatingly claim to know many things that surely transcend the power of the individual resources they bring to the epistemic task. To be sure, individual cognizers know about the existence and disposition of middle-sized objects and their surroundings in the more or less immediate vicinity, but they also know facts well beyond their immediate ken, such as numerous everyday facts of geography and history. They also know how conceptually to identify and linguistically to label these objects and surroundings in terms intelligible to others. Beyond this array of relatively ordinary convictions, there are a host of more recondite things many such individuals know - such as the population of the USA, the day-to-day temperature of the environment, the non-existence of a largest prime number, the military practices of ancient peoples, the chemical composition of water or of various medicines, certain facts about the workings of engines and about the workings of institutions.

It is, I think, perfectly clear that the isolated individual imagined as the hero of so much epistemological writing is not equal to the task of amassing such knowledge from purely individual resources of perception, experiment, memory and inference. Some theorists, it is true, heroically deny that anything that involves accepting the word of others can really deserve the name of knowledge. But they have either failed to appreciate the enormity of this denial, in terms of the massive amount and quality of information thus excluded and its often intimate connection with much else that is included, or they have so construed knowledge as to make its attainment a rare privilege for the elite (as in Plato who banishes not only testimony but also perception from the realm of knowledge, and then imagines that a purified 'science' will emerge from contemplation of the unchanging Forms). Short of such heroic, but either myopic or puritan, responses we have no option but to recognize the need for a pooling of resources so that knowledge requires some reliance upon one's fellow cognizers. But the individualist picture dies hard. So the idea emerges that the necessary reliance upon the word of others in the enterprise of knowledge is itself something

for which the isolated individual discovers the need and provides (from individual resources alone) the justification.

2 Autonomy and reduction

This individualist idea is essentially reductionist, in the sense that it attempts to show that, at the significant core of the epistemological enterprise, we have no need of any basic or primitive reliance upon the word of others. At this level, we need only the individual resources of perception, memory and inference. We rely extensively on the reports of others, of course, in the final development of knowledge, but this reliance is itself established by and dependent upon the primary operations of those individual resources. The idea that this must be so has great appeal because of the influence of a certain ideal of intellectual 'autonomy'. This ideal is well captured at the beginning of modern philosophy in Descartes' philosophy. There we find an outlook on knowledge that remains immensely influential today even among those who reject, and even denounce, most of Descartes' specific conclusions and many of his assumptions. Descartes makes it clear that the task he sets himself is precisely that of finding out whether it is possible to have fully autonomous knowledge, knowledge that you have rationally guaranteed entirely by and for yourself. As he puts it in the *Discourse on Method*:

> So, too, I reflected that we were all children before being men and had to be governed for some time by our appetites and our teachers, which were often opposed to each other and neither of which, perhaps, always gave us the best advice; hence I thought it virtually impossible that our judgments should be as unclouded and firm as they would have been if we had had the full use of our reason from the moment of our birth, *and if we had always been guided by it alone*.
>
> (Descartes [1637] 1985: 117, emphasis added)

Although Descartes then tries to establish how he is entitled to trust himself in the proper exercise of his own isolated cognitive powers, he never addresses the question of how solitary cognizers can employ their reason to validate in an 'unclouded' fashion their inevitable reliance upon others. Later theorists, however, occasionally try to deal with this problem. From an ideal of entirely 'autonomous' knowledge there is born the correlative portrait of the autonomous knower who extends and enriches knowledge by relying upon others only by licensing their word to be reliable by unaided epistemic efforts. Different theorists have different stories to tell about how the autonomous knower brings off this remarkable feat. One of the most vivid presentations of the picture, and one of the most influential accounts of how the feat is to be done, may be found in David Hume, though there are also different attempts in a similar reductive spirit by other philosophers such as F.H. Bradley and Bertrand Russell.

3 Hume and the reductionist project

Hume's idea is that the 'autonomous knower' does indeed rely, and rely quite extensively, on the testimony of others, but does so because of constant conjunctions discovered by personal checking on their reliability in a testimony-free way. So Hume says of reliance upon testimony:

> our assurance in any argument of this kind is derived from no other principle than our observation of the veracity of human testimony, and of the usual conformity of facts to the reports of witnesses. It being a general maxim, that no objects have any discoverable connexion together, and that all the inferences, which we can draw from one to another, are founded merely on our experience of their constant and regular conjunction; it is evident that we ought not to make an exception to this maxim in favour of human testimony, whose connexion with any other event seems, in itself, as little necessary as any other.
>
> (Hume [1748] 1975: 111)

The idea turns out to be methodologically ambiguous: do the autonomous knowers accept testimony in an entirely piecemeal fashion because they have independently ascertained the reliability of this or that particular witness, or do they proceed by determining the reliability of the various classes of cognitive agents to which witnesses belong, or is it merely that they know they can do one or other of these checks if needs be? Given the scope and depth of our dependence on what others tell us, the first suggestion opens up our cognitive landscape to interminable investigative travelling that would make a nonsense of inquiry itself. The third asserts a mere possibility and hardly seems a move in the justificatory game. The second, which is more plausibly Hume's idea, reduces the labour somewhat, but still requires an immense amount of checking, and more significantly owes us a non

question-begging account of what counts as a class of witnesses. This is much harder to provide than it seems.

When Hume discusses the task of justifying reliance upon testimony, he talks at one point of its being ‘founded on past experience’ and varying in probity ‘according as the conjunction between any particular kind of report and any kind of object has been found to be constant or variable’ (Hume [1748] 1975: 112). But it is unclear whether ‘kinds of report’ are to be individuated by reference to type of speaker or type of content. If the former, then we are really checking upon expertise: we are seeking to find whether there is a high correlation between expert reports and the sorts of situations that experts report upon. But, even if we allow a broad interpretation of expertise (as we must if we are to include enough testimony for the project’s ambitions), we cannot detect expertise as we might detect colour or smell. That someone is an expert on the geography of Southeast Asia is either itself known in ways that rely directly or indirectly on the testimony of others, or it must be determined by observing personally some very high correlation between their reports and the state of the world. If the former, then we are no further advanced on the reductionist programme since the same problem arises over and over again; if the latter, then not only does the notion of an expert no longer provide us with a specification of a kind of report, but we would usually have to be experts ourselves to be in a position to determine whether the particular correlations obtain. On the other hand, if we interpret ‘kinds of report’ as ‘reports of kinds of situation’ we face other intractable problems. For instance, a problem arises immediately about the degree of specificity to be attached to the classification of kinds of situation. For the purpose of checking do we classify the utterance ‘This is a car that is in perfect working order’ as an existence report, a motor vehicle report, a mechanical report or an evaluation? There seems no intrinsic reason to proceed one way or another here, and yet it seems to be of the first importance how we go.

4 Vulnerable assumptions

Another problem for any reductionist project concerns the fact that the plausibility of supposing that testimony-free verifications of reliability are usually available seems covertly to depend upon accepting testimony-laden checks, observations and falsifications. We have seen this problem arise in the particular case of checking for expertise, but its significance is wider than that since all sorts of apparently personal verifications will turn out to be dependent upon unchecked testimony. If I become suspicious of a job applicant’s claim to have a Ph.D., for instance, I can seek to check personally on the claim (in the sense of conducting the investigation on my own behalf) but this endeavour will invariably involve accepting the word of some people or institutions that the degree was or was not awarded. Moreover, the reliability of these people or institutions will often be either taken for granted or accepted on the basis of reputation, which is itself a complex form of hearsay, as are the documents and certificates the institutions may offer as evidence. Such often-ignored facts account for the way Hume and others persistently and unconsciously conflate individual and social readings of the term ‘observation’, a conflation that makes Hume’s project seem more manageable than it really is. When he refers to the need to base ‘our’ (that is, the sum of individual cognizers’) reliance upon testimony on ‘no other principle than our observation of the veracity of human testimony’ ([1748] 1975: 111), Hume is sliding between the two senses of ‘observation’. ‘We’ can observe the veracity of human testimony only if we already trust each other’s testimony sufficiently for the project to be no longer that of the autonomous knower.

Hume’s problems are symptomatic of the fact that the reductionist picture in which the autonomous knower figures so centrally is flawed at heart since the existence of a common language in which reports are made and accepted or rejected already carries with it a commitment to some degree of unmediated acceptance of testimony. The reductionist strategy necessarily supposes that we can fully understand what we are told in a public language and then independently investigate its truth or correctness, but the connections between linguistic comprehension and truth (or at least correct assertibility) are much closer than this picture allows. The reductionist project must concede that the autonomous knower might consistently understand correctly all that they were told but none the less find every report mistaken or deceitful. But any such ‘discovery’ would rather serve to refute the initial supposition that the reports had been correctly understood. Public languages are, after all, learnt and their use is subject to correction, so reports on usage and on some facts embodying that usage must have a degree of success that the reductionist ignores. Fixity of meaning depends upon some degree of successful reporting, though just what degree is a further question (Coady 1992: Ch. 9).

5 Further issues

Foundationalist theories of knowledge have recently been subjected to much scorn and criticism, a good deal of it

deserved, but one thing that seems right about the foundationalist emphasis is the idea that individual perception, memory and inference deserve a particular respect as sources of information in a way that speculation, guessing and suggestion (whatever their other cognitive value) do not (see Foundationalism). The challenge posed by testimony is that it seems to deserve a similar respect to perception, memory and inference, indeed, the respect we owe them may require us to accord it parallel honour. This is because testimony puts us in touch with the perceptions, memories and inferences of others, and a certain coherence between individual and communal resources underpins the individual's reliance on their own epistemic skills and achievements. It is precisely this status that the ideal of autonomous knowledge rejects.

Abandonment of the reductionist project does not mean that our general attitude to testimony should be one of gullibility. A comparison with memory makes the situation clearer: we cannot reduce our reliance upon memory to inferences from present perceptions but we also learn not to trust our memories blindly in all circumstances. The question of *how* trustworthy memories or testimonies are cannot be addressed by initially allowing that they might not be trustworthy at all, but this still allows that there are contexts and circumstances in which we should be wary of them. It also allows that there is room for serious investigation of the reliability of the testimonies of certain groups whose dependability is often questioned in legal and other contexts (for example, very young children, the seriously mentally ill, parties to an issue for adjudication), and the more general question of how reliable testimony might be in any given culture or context.

Throughout the above I have, in accordance with philosophical tradition, used 'testimony' as a broad term for certain sorts of telling, but it is an interesting and difficult task to give a serviceable definition of what these sorts are. The term is most at home in legal settings, but clearly a wider notion than that is required. One strategy is to define it as a type of speech act, but to allow extensions from the speech-act model for such things as maps, signposts and documentary records. There remain problems about whether to include competency and sincerity conditions in the definition and whether there is a sense of 'evidence' in which testimony by definition falls into the category of evidence. Some would see the former move as too demanding and the latter as question-begging.

Finally, the neglect of the topic by philosophers has left many important questions of law, history, psychology and religion to be debated without the benefit of concentrated philosophical input. These include such matters as the status of children's testimony at law, the problems posed by expert evidence, psychological claims about the unreliability of eye-witness identifications, and certain aspects of historical methodology, including the 'higher' biblical criticism.

Testimony in Indian philosophy

A prominent topic in Indian epistemology is śābdapramāṇa, *knowledge derived from linguistic utterance or testimony. The classical material is extensive and varied, initially concerned with providing grounds for accepting the wisdom of* śruti *or 'the heard word', that is, the canonical scriptures. The Buddhists, however, saw no need for* śābdajñāna *(information gained through words) as an independent source of knowledge, because any utterance (including the Buddha's) that has not been tested in one's own experience cannot be relied upon; and in any case, the operation of such knowledge can be accounted for in terms of inference and perception.*

The Nyāya, following the Mīmāṃsā, developed sophisticated analyses and a spirited defence of the viability and autonomy of testimony. The problem is recast thus: is śābdapramāṇa *linguistic knowledge* eo ipso, *or does verbal understanding amount to knowledge only when certain specifiable conditions, in addition to the generating conditions, are satisfied? The more usual answer is that where the speaker is reliable and sincere, and there is no evidence to the contrary, the generating semantic and phenomenological conditions suffice to deliver valid knowledge. If doubt arises, then other resources can be utilized for checking the truth or falsity of the understanding, or the reliability of the author (or nonpersonal source), and for overcoming the defects.*

1 The problem of *śābda*

Ever since some traditional philosophers made the intriguing claim that the Vedas (canonical Brahmanical texts) are an inviolable authority on all manner of things, debate has raged in Indian thought over whether *śābda*, or information derived from words, can rightfully be accepted as an autonomous mode of knowing. In other words, how can hearing a sentence under appropriate conditions serve as a means of acquiring knowledge? Philosophers in the tradition recognized that a theory is needed that gives an account of both the instrumental conditions by which words or linguistic utterances convey appropriate understanding and the epistemological grounds for adjudicating the validity of the understanding or cognition so derived. Indian schools of philosophy have responded in differing ways to this challenge.

In the general accounts of knowledge developed in India, a properly accredited source of knowledge (*pramāṇa*) is thought to be fundamental to the production of knowledge (see Knowledge, Indian views of). What could such a source be in the case of *śābdapramāṇa*? Obviously, but nontrivially, words themselves. This response indicates a remarkable recognition of the deep connection between words and knowledge, beyond the usual preoccupations with words and objects, names and things, and even knowing words. It does not take much argument to point out that a vast body of knowledge and beliefs is derived from sources other than perception and inference, namely, from the words of others, notably through hearing (direct conversation, rumour, radio and television) or reading (books, newspapers, documents, lexicons, inscriptions), not to mention the role of testimony under oath ('nothing but the truth') submitted in legal proceedings and courts of law. It should be noted that this account is not committed to suggesting that words exhaust or constitute the sole set of conditions that deliver the knowledge, or that the delivery is unproblematic in every instance. A number of factors are involved, and words arguably happen to be the primary causal antecedent, without which the delivery would flounder. That much is uncontroversial. The extent of the input from or reliance on other *pramāṇas*, including further testimony, remains to be established; much depends on the nature of the individual inquiry and the strength of conviction expected. Seen in this light, the question of the autonomy of testimony takes on a somewhat different significance, as does that of the reductivity of *śābdapramāṇa*. We shall return to this point.

2 Sentential meaning

The primary causal antecedent of knowledge through testimony is not just any string of words but a sentence (*vākya*). (This is also the basic unit of linguistic understanding for grammarians.) A sentence is made up of words, and sentential meaning is made up of word-meanings. A word (for example, 'cow') signifies either a universal (cowness) or a particular (dewlap-thing) possessing that universal, or it denotes a general class (cows), or perhaps even names an entity (Gokula). There is much discussion as to whether it is words or their meanings, whether singly or together, or the indivisible sentential structure, that convey the meaning of a sentence (*vākyārtha*) to a hearer. And the corollary issue of whether words achieve their signification individually, or by piecemeal compounding, or only by being related to other parts in the whole context of a sentence, is equally rehearsed, with

various compromise positions. However, the main issue boils down to this: what does a sentence succeed in conveying, under appropriate conditions? It is clearly the (sentential) meaning that is grasped. But 'meaning' here is not exactly what linguists and grammarians are usually concerned with; it is more than the structure of the cognitive state constructed from the grasped words. *Vākyārtha* is literally the object out there, a compound object whose components are the component word-meanings. For example, grasping the meaning of the expression 'The lotus (is) blue', regardless of whether the object spoken of is present or not, amounts to cognizing a substratum, possessing lotusness, characterized by the quality blueness (the substratum that registers in awareness is represented by an oblique 'this': the awareness that there is something, *X*, qualified by blueness). Let us for now call this special cognition *śābdabodha* (standing in for *śābdajñāna* - awareness of the linguistic components or structure - and *anvayabodha* - comprehension of sense, or linguistic understanding), and render this as 'linguistic knowing'.

But what exactly is the meaning in respect of - reference or sense, or some other kind of designation? Some writers have argued that Indian philosophy does not have a clear notion of sense (as an abstracted conceptual representation or phenomenological 'thought') either because the sense-reference distinction is altogether lacking, or because some theory of reference has been dominant and sense has been subsumed as merely a mode of presentation consistent with the theory of reference (Mohanty 1992). Thus it falls short of allowing a sentence to achieve signification of any kind other than a direct denotation of the objective state that is its referent; this is construed as a complex relational object (in Nyāya) or related designation (in Prābhākara Mīmāṃsā). K.C. Bhattacharyya (1956) put it succinctly thus: 'The word directly refers to the thing, expresses the thing, touches it in a sense… The sentence at once refers to an objective relation.' (Clearly it is neither belief nor proposition that is of concern here, for the epistemic content of the word-derived cognition is more primitive than presupposed by either of these two pervasive categories of analysis.)

What is grasped in the cognitive state - that is, in *śābdabodha* under appropriate conditions - is a structure with various qualifying items that bear direct reference to objects thereby known. It follows that if in the process of grasping an expression some object fails to be clearly registered in the cognitive state (*anubhava*) or conflicts with another item in the structure, then a *śābdabodha* properly speaking cannot arise. The epistemic significance of this rider cannot be overstated, as it is connected with the fulfilment of the often-mentioned appropriate or specified conditions (*kāraṇas*). These conditions mark the uniqueness and therefore autonomy of *śābdabodha* in a way that is not available to perception and inference.

3 The conditions of understanding

Just as a sentence is not just any string of words, so sentential meaning is not conveyed unless certain conditions obtain. These conditions pertain to the relation, connection, integration and presentation of the words and their respective meanings or senses, and provide checks against vitiating factors, thus ensuring an unhindered and 'valid' grasp of sentential meaning. There are four conditions, whose relative degrees of importance depend on the school one follows. The first is contiguity (*āsatti*), which requires that words should follow each other in contiguous or proximate relation, for too large a spatial or temporal distance between words can be a linguistic hazard. The second condition is expectancy (*ākāōkṣā*). When a word is uttered it arouses the expectation of another word that will appropriately complete the syntactical relation. When a speaker utters the words 'the door' the hearer expects another word (or series of words), such as 'close' or 'paint', to connect a pending meaning so as to complete the *śābdabodha* set in motion. The third condition is intentionality (*tātparya*), which refers to the speaker's intention or the intended purport of the expression. This is needed especially to disambiguate petrified meanings where the speaker desires a particular meaning to be conveyed, and also to carry the meaning of an expression whose speaker is either unavailable or nonexistent beyond the didactic (or literal) meaning (as in the case of the allegedly authorless scriptures and impersonal ordinances). The fourth and probably most controversial condition is semantic compatibility (*yogyatā*).

Yogyatā or semantic 'fitness' is related to *ākāōkṣā*, as what is to follow the anticipation aroused should be a meaning which appropriately and not simply contingently completes the objective reference. In other words, it would be a source of frustration if after hearing someone utter the words 'the door', the hearer were to be presented with the words 'fuels the sun's fire'. With respect to whole utterances, the condition of *yogyatā* would rule out *śābdabodha* from expressions such as 'He wets with fire', since 'wetting' and 'fire' are mutually

incompatible. On the strict Nyāya interpretation, there is no possibility of linguistic knowing arising here because there is incompatibility between the items being conjoined. The fitness expected is as much between the things signified (related in the reference) as it is with the signifying terms. With one part of the reference left as it were 'unsaturated' the truth-value presented is incomplete. On this interpretation, a sentence '*a* is *F* is characterized by fitness (*yogyatā*) only if *a* is *F*. It follows that if a sentence is false, it cannot generate *śābdabodha*. Only true sentences, on this interpretation, are fit and so can generate *śābdabodha*. Not only contradictory sentences such as 'The fireless hill has fire', but also syntactically consistent but semantically absurd sentences such as 'Idleness is green' and even contingently false sentences such as 'It is raining' (when it in fact is not) - all these, strictly speaking, cannot generate *śābdabodha*, for there are no objective relational referents that answer to the disparate component-meanings.

The virtue of this argument is that it restricts the scope of *śābdapramāṇa* or testimony by stipulating a criterion that raises the epistemic value of the word-derived cognition so that not every expression can present itself as a fit candidate. And this criterion is built into the linguistic operation itself. But this also implies that if a sentence is not true, it lacks fitness and will fail to generate linguistic knowing. Two questions arise: (1) Does this mean that in the case of a false sentence no linguistic understanding at all arises? (2) Is the truth of a sentence always established or given a priori when the sentence is being understood? With respect to (1), it is urged that even with a patently false sentence (such as 'The sun is a ball of golden jelly') one does understand something from it; one at least knows that it is false. Why should this be any different from erroneous perceptions, which are still admitted to be 'perceptions' even though hopelessly false? Why can there not simply be 'false linguistic cognitions'? But even to know that a sentence is false, one has to understand something about the complex content of the sentence, in a way not dissimilar to understanding the complex relational object of a true sentence.

This recognition of a further, if weaker, cognitive process requires that we make a distinction between knowing and understanding. But the line of analysis followed so far has almost precluded the admission of such a distinction. This is due in large measure to the overwhelming influence of the Nyāya approach to the whole problem of language, which, with its unstinted commitment to a naïve realist ontology, has tended to eclipse more sanguine and less rigid analyses which not only admit of such a distinction but consider the function of understanding to be indispensable and necessary to the process. Prābhākara Mīmāṃsā, the Vedānta, the Jaina and the grammarians would side with the latter position. It is generally overlooked that Mīmāṃsābegins its theory of meaning with the thesis of language being eternal (*autpattika*), which, like Saussurean semiology, posits the inseparability of signifier (sound-form) and signified (mental/conceptual image) in a word (see MīmāṃsāČsect;3; Saussure, F. de §2). The composite designation derived from the component meanings need refer to no object(s) in the world as such, or can be simply a mode of presentation, and so on. Often, in the transmission of teachings, the pupil may acquire very directly images or complex ideas which have no objective correlate answering to the 'related designation' (see §2), which would be therefore better rendered as 'sense'. The inquiry into duty (*dharma*), the highest good and supplementary ethical notions, injunctional precepts, performatives (involving mantras), various illocutionary and perlocutionary speech-acts, poetic and mimetic evocations, and so on, involve an endeavour to generate verbal associations of this sort; the question of their truth and falsity, and of their being knowledge, can hardly be said to arise before their full significance and purport (teleological, soteriological or transcendental) is assimilated into the larger body of one's knowledge or beliefs. If the distinction is admitted, and understanding is permitted before the question of knowing is raised, then the thesis that identifies or collapses semantic fitness with truth-value is effectively shattered. This takes us to the second question.

4 Truth and falsity

Do all sentences come ready-stamped with the mark of truth or falsity? The idea that they might is not only counterintuitive, but an opponent might well urge that one hears a sentence and then, for the sake of conjecture and adventure, proceeds to determine whether it is true or false. From the hearer's subjective position, there is no other sense in which one can speak of the sentence being true or false moments prior to it being heard, without begging the question. (The speaker being aware or believing that the sentence uttered is false is of no relevance as this information is not available to the hearer, and besides, the sentence may well turn out to be true.)

Furthermore, a hearer may defer to the reliability of a speaker, trusting that the speaker is and has always been sincere and reliable. There may be no reason to doubt the reliability of the speaker and the hearer may take the

speaker's authority to be a reason for attending to the utterance in the first place. And suppose that the hearer wishes to know about certain things to which it is not possible to have access through perception and inference. Would it be an act of epistemological violence if the hearer decided to accept what they heard from the testifier, but perhaps subsequently made detailed investigations to either prove or disprove what they thus came to 'know'? When no further evidence either way is forthcoming - notably from perception and inference - one either reviews one's reliance on the authority itself, or one turns to logical and metaphysical arguments, as philosophers frequently do, to assuage growing doubts about the truth of one's forebears' utterances.

Finally, on the question of the non-reductiveness of *śābdapramāṇa*, some general points only can be noted here. The first issue is whether the requisite linguistic conditions are sufficient, in and of themselves, to mediate and deliver the kind of knowledge claimed for language. We observed earlier a resistance to collapsing semantic fitness into the requirement for truth so that it is not always possible to question whether what one understands is true or not. Even the scholastic Prābhākara Mīmāṃsā, for whom all cognitions arising from the appropriate use of the accepted *pramāṇas* are intrinsically true - that is, truth is given by virtue of the cognition being a knowing-state - will concede that errors do creep in, that one could be mistaken about what one takes to be true, especially with regard to nonperceptibles, and that such falsified knowledge has to be set aside.

Ironically for Nyāya, it is a general principle that truth is never self-evidentially given, for whether anything is a source of knowledge is a matter to be established *ab extra* (*parataḥ*), by certain 'marks of excellence' of evidence, and further corroboration that may involve pragmatic testing. One may even attempt to falsify a cognition to assess its tenacity. But if this is extended to *śābdabodha*, then it could be argued that testimony comes to depend on other resources for its validation and therefore loses its claim to be *sui generis*. Paradoxically, if such resources are not available in the case of nonperceptibles, then the risk of allowing certain linguistic understandings to stand without validation could become onerous; and deferring to further testimonies or to consensus on their reliability would only serve to perpetuate the process.

Tetens, Johann Nicolaus (1736-1807)

Tetens was a German philosopher, mathematician and physicist, with a second career as a Danish government official, who was active in Northern Germany and Denmark during the second half of the eighteenth century. Together with Johann Heinrich Lambert and Moses Mendelssohn, Tetens forms the transition from the German school philosophy of Leibniz, Wolff and Crusius to the new, critical philosophy of Kant. Tetens' philosophical work reflects the combined influence of contemporary German, British and French philosophical currents. His main contribution to philosophy is a detailed descriptive account of the principal operations of the human mind that combines psychological, epistemological and metaphysical considerations. While showing a strong empiricist leaning, Tetens rejected the associationist and materialist accounts of the mind, favoured in Britain and France, and insisted on the active, spontaneous role of the mind in the formation and processing of mental contents.

1 Life

Tetens was born in Tetenbüll (Schleswig, Northern Germany) - or, on another account, in 1738 in Tönning (Schleswig) - and died in Copenhagen. From 1755 until 1758 he studied mathematics, physics and philosophy at the universities of Copenhagen and Rostock. In 1759 he earned the degree of *magister* and began teaching at Rostock, where he defended his dissertation in 1760. From 1760 until 1776 he taught physics and philosophy at the newly founded Bützow Academy. In 1765 he also assumed the directorship of the local *Gymnasium*. From 1776 until 1789 he held a professorship at the University of Kiel, first in philosophy, and later also in mathematics. In 1789 he entered public service and had a distinguished career in the Danish Ministry of Finance.

Tetens' main philosophical works were written in the 1770s under the influence of Leibniz's posthumously published *Nouveaux Essais* (1765) and Kant's pre-critical writings. Tetens also made contributions to applied mathematics, meteorology, pedagogy and environmental engineering. With his wide range of research activities and his dual career in academia and government, Tetens was one of the few truly universal scholars in the tradition of Leibniz. His philosophical work places him among the very best in German philosophy between Leibniz and Kant. In several respects he is a direct precursor of Kant's critical philosophy.

2 Metaphysics

Tetens' philosophical work is informed by a sweeping knowledge of the main philosophical movements of his time. He was well acquainted with the Leibnizian-Wolffian school of philosophy and its pietist critics, was conversant with the Scottish Common Sense philosophers, knew the French materialist and sensualist philosophers, and was one of the few philosophers in Germany to read Locke and Hume before their works became available in translation (see Wolff, C.; Pietism; Common Sense School). In his eclectic stance towards those philosophical currents, Tetens resembled the position of the Berlin Academy and German *Popularphilosophie* in general. Yet unlike the main representatives of that movement, he held on to the German school-philosophical project of a 'first philosophy' or metaphysics. Like other proponents of metaphysics in eighteenth-century Germany, Tetens responded to the sceptical and materialist challenges to metaphysics with an investigation into the very possibility of metaphysical knowledge. In Tetens this methodological and epistemological reorientention of metaphysics has a decidedly psychological character; metaphysical concepts and the principles into which they enter are traced to their origin in the general operations of the human mind.

Tetens' guiding interest in the reform of metaphysics shows most clearly in his first significant work, *Über die allgemeine speculativische Philosophie (On General Speculative Philosophy)* of 1775. He argues for a truly general and comprehensive foundational science that is indifferent to the specifics of the two principal object domains of metaphysics - spiritual and corporeal reality. The science in question would not have specific objects as its domain but only the most general concepts and principles that pertain to being as such. Tetens' term for this discipline, that transcends all knowledge of specific objects, is 'transcendent philosophy'. According to Tetens, previous metaphysics suffers from a confusion of what is genuinely transcendent with the features of either corporeal or spiritual reality.

Tetens' chief concern is to ensure that the transcendent concepts and principles are not merely figments of the mind but have reality and pertain to objects outside the mind entertaining them. According to Tetens, the

validation of such metaphysical claims proceeds by appealing to psychological facts to be discovered through observation of the workings of one's own mind. Transcendent principles, such as the Principle of Sufficient Reason, are validated by the feeling of necessity that accompanies consideration of them. The reality of general concepts, including such transcendent concepts as causality and substance, is established by showing their material basis in sensations. For Tetens, there is no sceptical wedge to be inserted between our best evidence about the world and the way the world really is. Psychological necessity carries logical and ontological weight. He seeks to respond to Hume's doubt about the reality of causal connection by making a distinction between contingent mental habits and necessary manners of thinking. Yet while assuming the reality of universal forms of thinking, Tetens does not go on to draw ontological consequences from this fact, in the manner of Kant's distinction between things in themselves and appearances. Tetens came to see that before transcendent philosophy can be applied to objects outside the understanding, its concepts and principles have to be derived through a comprehensive philosophical account of human understanding.

3 Philosophical psychology

Tetens undertook such a detailed examination of the human mind in his main philosophical work, the *Philosophische Versuche über die menschliche Natur und ihre Entwickelung (Philosophical Essays on Human Nature and its Development)*, which was published in two volumes in 1777. In the first ten of the work's fourteen essays, Tetens follows Locke's descriptive method and provides a detailed classification of the mental powers and their modes of operation. The emphasis is on the power of cognition. Tetens here exceeds the confines of contemporary empirical psychology through the ontological and epistemological scope of his psychological considerations. The last four essays take up topics in rational psychology by discussing the nature of the soul with regard to its basic power, its freedom, its relation to the body and its perfectibility. The work often digresses and the relation between the various classifications of mental powers offered is not always clear. Yet the *Philosophische Versuche* contains a number of original contributions to the study of the human mind and constitutes a significant step in the prehistory of scientific psychology and cognitive science.

Tetens distinguishes three principal forces that make up the human power of cognition: feeling, representing and thinking. Feeling is the initial, merely passive stage of cognition. It consists in the mind's modificability or receptivity to sensations, but also includes the mind's passive ability of noticing its own states. Representing involves both phantasy, responsible for the associative grouping of representations, and imagination, through which new representations are formed. Thinking consists in the detection of relations among the mental contents presented through feeling and representation. The relations are articulated through concepts and judgments. Tetens provides a psychological derivation of the general relational concepts, such as identity and diversity or simultaneity and succession. He considers those general concepts and the judgments into which they enter sufficiently validated through the psychological necessity with which they present themselves in the mind.

Tetens stresses the active, spontaneous nature of representing and thinking. Even perception is said to involve mental activity beyond the reception of sensation. He considers whether there might be a fundamental principle underlying the three basic powers of cognition, but concedes the hypothetical nature of his speculations on a primitive mental force that would be both feeling and active.

When surveying the overall organization of the human mind with an eye to its most basic powers, Tetens separates the active cognitive powers from passive feeling. Representing and thinking now make up the understanding, while feeling is taken in a broader sense, encompassing the mind's affective response to its modifications through the sensations of pleasure and pain. To understanding and feeling Tetens adds volition as the third basic mental power, thus providing the immediate precedent for Kant's threefold division of the human mind into the faculty of cognition, the feeling of pleasure and displeasure, and the faculty of desire.

Tetens' inquiry into the basic force of the human mind as a whole leads him to broader considerations regarding the basic character of humanity, which he identifies as extraordinary modificability and disposition to spontaneous activity. This double characterization combines the recognition that physical and mental development is highly susceptible to external circumstances with the recognition that human mental life develops on the basis of internal forces.

While Tetens' contributions to the reform of metaphysics were soon overshadowed by Kant's *Critique of Pure*

Reason, the psychological approach to philosophical issues practised by Tetens found a number of successors in post-Kantian philosophy from Fries and Herbart to Laas and Brentano. In fact, Kant's distinction between a psychological, descriptive, and a nonpsychological, justificatory, dimension of knowledge, which had been developed mainly in response to Tetens, did not achieve canonical status until the neo-Kantianism of the late nineteenth century and the advent of anti-psychologism in logic - only to be questioned again in twentieth-century efforts to naturalize epistemology and ontology (see Neo-Kantianism).

Thales (*fl. c.*585 BC)

Known as the first Greek philosopher, Thales initiated a way of understanding the world that was based on reason and nature rather than tradition and mythology. He held that water is in some sense the basic material, that all things are full of gods and (purportedly) that all things possess soul. He predicted an eclipse of the sun and was considered the founder of Greek astronomy and mathematics.

1 Life and legacy

The first Presocratic philosopher and reputed founder of Western philosophy and science, Thales lived in the early sixth century BC in Miletus, a prosperous Ionian Greek city on the seaboard of Asia Minor. At Miletus he was followed in turn by Anaximander and Anaximenes, the other members of the so-called Milesian School. These two refined his rational approach to the study of nature and extended its application, leaving an intellectual legacy that was decisive for later Presocratic philosophers and, through them, for Plato, Aristotle and the Hellenistic philosophical schools, and consequently for the rest of the Western cultural tradition.

It is doubtful whether Thales wrote anything. Although ancient sources ascribe several works to him, no writing of his was available to Aristotle. Our knowledge depends entirely on the reports of others, many of which are inaccurate and even fanciful, thanks to the legendary status Thales achieved. Thales was the only Presocratic philosopher numbered among the Seven Sages, and this honour is probably due to his reputation for practical advice rather than for his scientific and philosophical work. He is said to have told the Ionian cities to form a political union with a common, centrally located governing council, the better to resist Persian aggression (Herodotus, I 170, A4) and to have advised the Lydian king Croesus how to ford the Halys River (I 75, A6). He was most famous for predicting a solar eclipse that took place on 28 May 585 BC (I 74, A5).

2 Philosophy

Thales is widely believed to have held that all things are made of water. This interpretation goes back at least to Aristotle (*Metaphysics* I 3, A12), who attributes it to Thales in summarizing the views of his predecessors which he regards as pertinent to his own investigation of *aitiai* (causes or explanatory factors). Thales, like ‘others who first pursued philosophy’, held that ‘the only principles (*archai*) of all things are principles in the form of matter’. He chose water as the unique material principle, in the sense that everything originally evolves from water and ultimately perishes into water and, more strongly, that all things are composed of water, which persists in them although its attributes change. Thus Thales is the first Ionian material monist and the founder of physical science (see Archē).

How accurately Aristotle’s interpretation represents Thales’ views is open to question, for it dresses Thales in Aristotelian language and concepts and presupposes that he was interested in the very problems that excited Aristotle two centuries later. Furthermore, it is possible that Aristotle’s account (‘Thales, the originator of this kind of philosophy, says it is water; this is why he declared that the earth rests on water’ (*Metaphysics* I 3, A12)) merely records Aristotle’s own inference that Thales held water to be the material principle on the basis of the view, which he confidently attributes to Thales, that the earth rests on water. This possibility, together with the weakness of the inference, makes it less likely that Thales was a material monist in Aristotle’s sense.

On an alternative theory, also based on ancient evidence, Thales borrowed the belief that the world floats on water from Egyptian and/or Babylonian creation myths such as the *Enuma Elish* (see Egyptian philosophy, influence on Ancient Greek thought §1). This view is not implausible since Thales reportedly visited Egypt and Miletus had commercial connections with Egypt and the Near East. According to these creation myths, the earth or land arose in the middle of primeval waters through the agency of one or more gods. Thales may thus have borrowed also the idea that water is the origin of the world, conceiving of it not as an Aristotelian material principle, but as the ultimate ancestor of all things. It may be significant that *archē*, Aristotle’s word for ‘principle’, also means ‘origin’ or ‘beginning’.

Even on this account Thales did more than borrow; he took a decisive step away from the traditional and mythological towards the philosophical and scientific by demythologizing the views he adopted. Not that he was an atheist; he and his successors believed strongly in the divine and its importance in the universe. However, they

abandoned the traditional Greek tendency to explain events through the Olympian gods. Where tradition had attributed earthquakes to Poseidon, Thales explained them in terms of the motion of the water that supports the earth (Seneca, *Natural Questions* III 14, A15). This way of thinking is more apparent in the theories of later Presocratics than in what we know of Thales himself, but their agreement on this approach was doubtless one of Aristotle's reasons for calling Thales the originator of materialism and for distinguishing him from purveyors of mythological accounts of creation.

Thales' views on divinity and on soul are attested as follows. 'He said that the magnet possesses soul (*psychē*) because it moves iron' (Aristotle, *On the Soul* 405a20, A22) (see Psychē). 'Some say that soul permeates the universe. This may have been Thales' reason for thinking that all things are full of gods' (*On the Soul* 411a7, A22). These reports have led some to describe Thales' world view as panpsychism and pantheism, but such labels by themselves contribute little to understanding a philosopher's thought. In the first place, the notion of soul needs clarification. Briefly and dogmatically, on the Greek view of soul which Aristotle develops and for which he finds evidence in Thales, the presence of soul is what makes something alive; non-living things have no soul, and dead things no longer have one. Signs of life include the capacities to move and change, and to cause other things to move and change. In Thales' case we have three claims: (1) the magnet moves iron, therefore it possesses soul; (2) soul permeates the universe; and (3) all things are full of gods. Only (1) and (3) are explicitly attributed to Thales; (2) is conjectured to be his reason for holding (3), and no connection is asserted to hold between (1) and (3). Now (3) does not follow from (2) without further premises, including one that amounts to: (4) wherever there is soul, there are gods. If Thales held this view (a hypothesis that is historically plausible, if unprovable), then (1) becomes relevant, since it establishes that soul occurs in more things than people suppose, and hence provides support for (2). Even so, the argument falls short. Even granted that anything that makes other things move is alive, we need not suppose that everything whatsoever is alive. Still, this could be how Thales reasoned, in view of the Presocratic tendency to make generalizations on the basis of slender evidence.

This reconstruction of Thales' reasoning is tentative and optimistic, for (1) and (3) are the only views ascribed to him, and he could have held them independently of one another. However, his views on the role of water in the universe support the connection of ideas suggested above. Briefly and dogmatically again, the Greeks commonly held that anything was divine that was immortal and had the power to affect things independently of human will. On the second account of water presented above, water could be considered as divine and (for reasons given above) also as possessing soul. Things made out of water, or ultimately descended from water - that is, *all* things - thus have a claim to possessing soul and being divine, although these properties are more or less obvious in different things (just as some things are wetter than others).

3 Mathematics and astronomy

As Aristotle made Thales the originator of philosophy, so Aristotle's student Eudemus, who wrote histories of geometry and astronomy, made him the first Greek mathematician and astronomer. Here too the nature of his originality and contributions is uncertain. Reportedly he brought geometry to Greece from Egypt, where it was used for practical purposes and 'attacked some [theorems] more generally and others more perceptually' (Proclus, *On the First Book of Euclid's Elements* 65.3, A11). He was the first to prove that a circle is bisected by its diameter (157.10, A20), and to know that triangles having one side and the two adjacent angles equal are congruent, 'since he must have used this theorem in his method for demonstrating the distance of ships at sea' (352.14, A20). He is also credited with discovering several other theorems. The evidence supports different interpretations, from the extreme position that Thales stated and proved certain theorems exactly as they appear in Euclid, to the other extreme that he was no mathematician at all, but that Eudemus attributed certain results to him in order to give geometry as noble an ancestry as philosophy. An intermediate view is preferable; that he made certain discoveries about spatial relations and used them to solve practical problems, but did not have a general conception of mathematical proof, let alone of a Euclidean axiomatization of geometry, and probably did not even state the propositions generally. He is explicitly credited with proving only the claim about the circle - a proposition which Euclid does not prove, but incorporates into his definition of the diameter of a circle (*Elements* I def. 17). He may have proved this result by 'superposition' - drawing a circle, cutting it along a diameter, and seeing that one piece fits exactly over the other. This is not a rigorous demonstration, but since it shows that one fact follows from another and holds generally of all circles, not only the one used in the proof, it contains the essence of the conception of mathematical proof, and would represent a decisive advance from the

problem-solving and rule-oriented approach of the Egyptians and Babylonians.

In astronomy he was credited with many discoveries, but in the end his fame as an astronomer rests on his prediction of the eclipse. However, even this cannot be accepted straightforwardly. For Thales certainly lacked the knowledge needed to predict eclipses by modern methods. At most he reported a Babylonian prediction: the Babylonians had methods of predicting when eclipses might occur, and there is nothing improbable about Thales' having come into contact with such knowledge.

The central problem in assessing Thales' contribution concerns his originality and his borrowing from others: how much was there of each, and what relative value are we to assign them? The evidence is unanimous in singling him out as a great innovator, and it would be rash to deny him all claims to importance, even if much of what he professed was due to others, especially non-Greeks. Later Ionian philosophers admired him and recognized him as their predecessor, and their ideas and methods are plausibly interpreted in terms of a historical sequence that originated with his evident curiosity about the world, his polymathy and his rational approach.

The constructible universe

the 'universe' of constructible sets was introduced by Kurt Gödel in order to prove the consistency of the axiom of choice (AC) and the continuum hypothesis (CH) with the basic (ZF) axioms of set theory. The hypothesis that all sets are constructible is the axiom of constructibility *(V = L). Gödel showed that if ZF is consistent, then ZF + V = L is consistent, and that AC and CH are provable in ZF + V = L.*

1 The universe of constructible sets

The 'universe' of constructible sets was the first example of an inner model (see Set theory, especially §7, the notation and terminology from which will be used throughout). The 'universe' of all sets consists of a hierarchy of (transitive) levels $V(\alpha)$, where:

$$V(0) = \emptyset V(\rho+1) = V(\rho) \cup \wp(V(\rho)) \text{ at limits } V(\tau) = \cup\{V(\sigma) \mid \sigma < \tau\}$$

The universe of constructible sets has two equivalent definitions. According to the first definition, the constructible universe consists of a hierarchy of (transitive) levels $L(\rho) \subseteq V(\rho)$ where:

$$L(0) = \emptyset L(\rho+1) = L(\rho) \cup \lambda(L(\rho)) \text{ at limits } L(\tau) = \cup\{L(\sigma) \mid \sigma < \tau\}$$

where the elements of $\lambda(X)$ are those subsets of *X* that are obtainable from elements of $X \cup \{X\}$ by a few simple set-theoretic operations:

$G_1(u,v) = \{u,v\}$
$G_2(u,v) = u - v$
$G_3(u,v) = u \oplus v$
$G_4(u) = dom(u)$
$G_5(u) = \in_u = \{(w,v) \in v \in u\}$
$G_6(u) = \{((a,b),c) \mid ((b,c),a) \in u\}$
$G_7(u) = \{((a,b),c) \mid ((c,b),a) \in u\}$
$G_8(u) = \{((a,b),c) \mid ((a,c),b) \in u\}$

According to the second definition, the constructible universe consists of a hierarchy of (transitive) levels $M(\rho) \subseteq V(\rho)$ where:

$$M(0) = \emptyset M(\rho+1) = M(\rho) \cup \mu(M(\rho)) \text{ at limits } M(\tau) = \cup\{M(\sigma) \mid \sigma < \tau\}$$

where the elements of $\mu(X)$ are those subsets *Y* of *X* that are *definable* over *X*, in the sense that for some formula $\Phi(u,v,w,\ldots)$ and some $y,z,\ldots \in X, Y = \{x \in X \mid \Phi^X(x,y,z,\ldots)\}$. The highly technical proof of the equivalence of the two definitions involves correlating the set operations $G_1,\ldots,G_8$ with certain syntactic operations by which a complicated formula Φ can be built up from simpler formulas. A set *x* is *constructible* if $x \in L(\rho)$ for some ordinal ρ, or equivalently if $x \in M(\rho)$ for some ρ.

The condition '*x* is constructible' is expressible by a formula $\Xi(x)$ of the symbolic language of set theory. Gödel showed that if Ψ is an axiom of ZF+V=L, then Ψ^Ξ is provable in ZF, where Ψ^Ξ is obtained from Ψ by restricting all quantifiers 'for all *x*' and 'for some *x*' to read 'for all *x* such that $\Xi(x)$' and 'for some *x* such that $\Xi(x)$', in other words, by restricting them to read 'for all constructible *x*' and 'for some constructible *x*'. The highly technical proof involves heavy use of 'absoluteness' considerations and of various necessary and sufficient conditions for being a model of this or that axiom of set theory (see Set theory §6).

In handling the axioms of ZF, it is generally most convenient to use the second definition of constructibility. For instance, to handle the axiom of union, one must show that if *x* is constructible, then $\cup x$ is constructible: If $x \in M(\rho)$ for some ρ, then $\cup x \in M(\sigma)$ for some σ. To do this, one observes that the formula $\Phi(x,z)$ or '$z \in y$ for some '$y \in x$', which expresses the condition '$z \in \cup x$', is limited and therefore absolute for transitive sets such as the levels $M(\rho)$, so that $\cup x = \{z \mid \; Phi(z,x)\} = \{z \in M(\rho) \mid \Phi^{M(\rho)}(z,x)\} \in \mu(M(\rho)) \subseteq M(\rho+1)$. The separation axiom of ZF requires special handling. To handle it, one must show that for any formula Φ, if *x* is constructible, then $\{y \in x \mid \Phi^{Xi}(y)\}$ is constructible. Now if $x \in M(\rho)$ one has $\{y \in x \mid \Phi^{M(\rho)}(y)\} \in M(\rho+1)$, so it would suffice to show that for any formula Φ there are arbitrarily large

ordinals ρ such that for any $y \in M(\rho)$, $\Phi^{Xi}(y)$ holds if and only if $Phi^{M(\rho)}(y)$ holds. This result can be established, and indeed it is a fairly straightforward variant of the reflection principle (see Set theory §7).

In addition to handling the axioms of ZF, the axiom of constructibility must also be handled, for which purpose it is most convenient to use the first definition of constructibility. The axiom of constructibility asserts that $\Xi(x)$ holds for all *x*. What one must prove is the assertion that results when all quantifiers in this axiom are restricted to sets *x* such that $\Xi(x)$: What one must prove is the assertion that $\Xi^{\Xi}(x)$ holds for all *x* such that $\Xi(x)$, where Ξ^{Ξ} is the result of taking the rather complicated formula Ξ expressing constructibility and restricting all its quantifiers to constructible sets. Considerations of absoluteness are crucial. One successively establishes the absoluteness of the formulas expressing the conditions '$w = G_i(u, v)$', '$Y = \lambda(X)$', '$X = L(\rho)$'.

2 The axiom of constructibility

By basic ordinal arithmetic (see Set theory §4), if there is a well-order of a set *X* of order type σ, then there is a well-order of $X \otimes X = \{(u, v) \mid u, v \in X\}$ of order type σ^2. This basic fact, together with the fact that each element of $\lambda(X)$ is of the form $G_i(u, v)$ for some *i* and some $(u, v) \in X$, can be used to show that if there is a well-order of a transitive set *X*, then there is a well-order of the transitive set $X \cup \lambda(X)$ in which the elements of *X* come before those of $\lambda(X) - X$. In particular, if there is a well-order of $L(\rho)$, then there is a well-order of $L(\rho + 1)$ in which the elements of $L(\rho)$ come before the elements of $L(\rho + 1) - L(\rho)$. This fact can be used to prove by transfinite induction that there is a well-order of $L(\rho)$ for every ρ. It follows that for any set *x* that belongs to some $L(\rho)$ there is a well-order of *x*, namely the well-order of $L(\rho)$ restricted to *x*. It follows that if the axiom of constructibility V = L holds, so that every set belongs to some $L(\rho)$, then for every set *x* there is a well-order of *x*, so that the well-ordering principle WO holds. But WO is a well-known equivalent of the axiom of choice AC. Thus V = L implies AC.

By basic cardinal arithmetic (see Set theory §3, notation and terminology from which is used throughout), if *X* is countable, then so is $X \oplus X$. This basic fact, together with the fact that each element of $\lambda(X)$ is of the form $G_i(u, v)$ for some *i* and some $(u, v) \in X$, can be used to show that if a transitive set *X* is countable, then so is $X \cup \lambda(X)$. In particular, if $L(\rho)$ is countable, then so is $L(\rho + 1)$. This fact can be used to prove by transfinite induction that $L(\rho)$ is countable for every countable ρ. It follows that the set of those sets *A* of natural numbers such that $A \in L(\rho)$ for some countable ρ cannot have cardinal greater than $\aleph_1$. Gödel proved that if *A* is a set of natural numbers is constructible, so that $A \in L(\sigma)$ for some σ, then in fact $A \in L(\rho)$ for some *countable* ρ. His proof combined heavy use of absoluteness considerations with a celebrated result of mathematical logic (see Löwenheim-Skolem theorems and nonstandard models). It follows that the set of constructible sets of natural numbers cannot have cardinal greater than $\aleph_1$.It follows that if the axiom of constructibility V = L holds, so that every set (of natural numbers or of anything else) is constructible, then the set $\wp(\omega)$ of *all* sets of natural numbers must have cardinal exactly $\aleph_1$ so that the continuum hypothesis CH holds. A generalization establishes that V = L in fact implies the generalized continuum hypothesis GCH.

V = L also has implications for descriptive set theory (see Set theory §5): in descriptive set theory, well-orders and AC are used both to produce sets with desirable properties (uniformizability) and to produce sets with undesirable properties (non-measurability). Assuming V = L, the well-order of the real numbers $\mathbf{R}$ obtained as above, when considered as a subset of the plane $\mathbf{R} \otimes \mathbf{R}$, turns out to be not too complicated (a $\sum_2^1$ set). It follows that $\sum_p^1$-uniformization for all *p*, and hence projective uniformization PU, can be proved assuming V = L; but $\sum_2^1$-measurability, and hence projective measurability PM, can be refuted.

V = L also has implications for combinatorial set theory (for which see Set theory §4, notation and terminology from which will be used). One such consequence of V = L is the principle $\diamond$, asserting that there is a function *S* from Ω to $\wp(\Omega)$ with $S(\rho) \subseteq \rho$ for all $\rho < \Omega$ such that for any $X \subseteq \Omega$, $\rho < \Omega \mid S(\rho) = X \cap \rho$ is stationary. While the significance of this principle is hardly obvious on first reading, it has an important consequence, namely ~SH, the negation of Suslin's hypothesis SH about the order type θ of the usual order on the real numbers. Much more complicated combinatorial principles, implying or implying the negation of various historic conjectures have been derived from V = L through a minute analysis of the fine structure of the constructible universe by Ronald Jensen.

While the addition of certain hypotheses to ZFC as new axioms has sometimes been advocated (see Set theory §6), the addition of V = L to ZF as a new axiom has seldom been so proposed (and was not so proposed by Gödel). This is because V = L seems contrary to the intuition that the universe of all sets is as 'wide' as possible, containing wholly arbitrary collections, and because its consequences in descriptive set theory are not all desirable or attractive. Indeed, strong large cardinal and determinacy axioms, which imply both PU and PM, and which *have* often been often advocated, are incompatible with V = L. But even in investigating these other axioms, the method of 'inner models', of which the constructible model is the prototype, has been widely useful, as have variants of the constructible universe itself. (For instance, the variant $L\,[\mathbf{R}]$, which starts with $L(0) = \mathbf{R}$ rather than $L(0) = \emptyset$, plays a role in such investigations: The proof that SC implies PD proceeds by proving that SC implies that AD holds in $L\,[\mathbf{R}]$, and that AD holding in $L\,[\mathbf{R}]$ implies PD.)

Themistius (*c.* ad 317-*c.* AD 388)

As a pagan philosopher and adviser to Christian Roman emperors, Themistius aimed at making the celebrated writings of his heroes Plato and Aristotle more accessible through explanatory paraphrase. An apostle of cultural Hellenism to his contemporaries, in the Middle Ages he was widely known as an important epitomizer of Aristotle.

Themistius was a philosopher, orator, politician and imperial adviser. In Constantinople he administered a school from AD 345 to 355, where he lectured to large audiences on classical philosophy, especially that of Aristotle. Unlike most Aristotelian commentators in late antiquity, Themistius combined theoretical and practical aspects of Hellenistic thought and presented them in a rhetorically effective manner. After his official appointments in 355 to a chair of philosophy and to the new Senate at Constantinople, he served Christian emperors from Constantius II to Theodosius I, eventually attaining the high rank of City Prefect in 384. His thirty-four surviving speeches celebrate imperial occasions and, more generally, articulate an influential ideology of monarchy and ecumenical empire, where foreigners with their different religions would be welcome. As a champion of the new secular Hellenism, Themistius argued that an emperor should display the qualities of a philosopher-king, that is, be both an Alexander and a Socrates. His advocacy of religious toleration is remarkable for a fourth-century pagan intellectual; he considered Christianity valid as one of the ancient cults ordained by the highest god.

The popularizing method of teaching employed by Themistius is evident in his philosophical writings. Instead of the traditional detailed textual commentary for advanced students, Themistius composed paraphrases which were designed as explanatory recapitulations to be read in conjunction with the original texts. This type of exegesis, particularly of Aristotelian works, became extremely popular throughout the medieval period in western Europe, Islamic countries and Byzantium. Of the five surviving paraphrases of Aristotelian works, three (on the *Posterior Analytics*, on *On the Soul* and on the *Physics*) survive in Greek. Those on *On the Heavens* and *Metaphysics* XII survive in medieval Hebrew translations from Arabic. Perhaps the most noteworthy of the lost paraphrases is one on the *Topics*, which influenced Boethius and early medieval logical theory (see Logic, medieval). Themistius' commentaries on Plato do not survive.

Certainly the most significant and influential of the surviving works is the paraphrase of the *On the Soul*. Themistius' interpretation of Aristotle's theory of the intellect became available to thirteenth-century philosophers through Averroes' commentaries on Aristotle (see Ibn Rushd) and William of Moerbeke's Latin translation. It had considerable impact on Thomas Aquinas and Siger of Brabant, the most important representative of Latin Averroism (see Averroism). New translations appeared in the fifteenth and sixteenth centuries.

Inasmuch as Themistius' epitomizing writings closely follow their Aristotelian originals, attention should be focused on his original interpretation of Aristotle's notoriously obscure account of the agent intellect (*nous poêtikos*) in *De Anima* III, 5. Themistius adds a substantial excursus on this difficult chapter, which analyses it in tandem with other Aristotelian texts and passages from Plato and Theophrastus. Aristotle spoke of two intellects, one actual and productive and one potential and receptive. The agent intellect is 'separable and unaffected and unmixed, being essentially actuality…. And when separated it is just what it is, and this alone is immortal and eternal.' Alexander of Aphrodisias, the last great Aristotelian commentator before Themistius (more than a century earlier), boldly asserted that the agent intellect was identical with Aristotle's supreme principle and cause of the universe, the unmoved mover which is a self-thinking intellect. Themistius rejected Alexander's equation on the grounds that Aristotle located the agent intellect 'in' the soul. He suggested instead that the productive intellect might be a secondary god, a suprahuman entity which is the cause activating each human being's 'possible' intellect. Thus, as the cause of thinking Themistius identified it with the Platonic form of the good (see Platonism, Early and Middle). The agent intellect, which Aristotle compared to light, is present like a ray to each mind when it thinks. The highest part of the human self is therefore a compound formed of the transcendent agent intellect and the individual's potential intellect. Unlike Aristotle and Alexander, Themistius claimed that the possible intellect when joined to the productive intellect constitutes the immortal aspect of human nature. Some scholars argue that human access to the transcendent aspect of the intellect is evidence of the influence of the noetic theory of Plotinus. Others emphasize Themistius' straightforward restatements of Aristotelian views and his preference for Aristotle's less idealistic ethical and political positions as compared to those of Plato and Plotinus as evidence that

his views are fundamentally Peripatetic.

Theological virtues

The three theological virtues of faith, hope and love, referred to frequently by the apostle Paul in his letters, play an indispensable role in Christian theorizing about a person's duties with respect to God. Thomas Aquinas is responsible for the most thorough and influential philosophical theory of the theological virtues. According to him, faith, hope and love are virtues because they are dispositions whose possession enables a person to act well to achieve a good thing - in this case, the ultimate good of salvation and beatitude. Without them, people would have neither the awareness of nor the will to strive for salvation. Despite the fact that they are infused in persons by God's grace, one can wilfully and culpably fail to let them develop.

Faith for Aquinas is the voluntary assent to propositions about God that cannot be known by the evidence available to the natural capacities of humans. Other theologians, such as Martin Luther and Søren Kierkegaard, deny the assumption that faith is primarily cognitive or propositional in nature, insisting instead that it is trust in God. Kierkegaard even challenges the presupposition that faith is logically continuous with natural knowledge. There has been much debate in the second half of the twentieth century as to whether it is ever rationally permissible to believe something on the basis of insufficient evidence.

According to Aquinas, hope for one's salvation requires that one already have faith. Hope requires that one remain steadfast in the face of despair on the one hand and presumption on the other. Aquinas models the virtue of love on one strand of Aristotle's notion of friendship. Love of God entails desiring the good that God has to offer, seeking to advance God's goals, and communicating one's love to God. Love for others follows from the realization that they are also created with good natures by God.

1 Aquinas on the theological virtues in general

For Aquinas (§13), a human virtue is a disposition whose operation enables its possessor to act well to achieve an end that is good for human beings. Following Aristotle, Aquinas distinguishes between intellectual and moral virtues. The intellectual virtues pertain to the human intellect in so far as it is capable of acquiring theoretical or scientific knowledge. The moral virtues help to govern human actions and emotions. The division of human virtues into intellectual and moral would be exhaustive if every end good for humans were natural. But Aquinas thinks that the ultimate end for humans is supernatural, the beatific vision of God (see Heaven §3). Because this end is beyond the natural order of things and because the intellectual and moral virtues are fit only for the achievement of natural ends, acts directed towards achieving the supernatural end must issue from dispositions that go beyond the natural capacities of humans, namely, the theological virtues. The theological virtues are unlike the moral virtues in two important respects: (1) the moral virtues are acquired by practice - a person becomes courageous, for example, by acting as the courageous person would act; and (2) with regard to the emotions, choices and actions appropriate to a particular moral virtue, the possessor of that virtue displays a state that is a mean, neither deficient nor excessive. Thus a courageous person's emotions, choices and actions will be neither cowardly (the deficient state) nor rash (the excessive state). In contrast to point (1), the theological virtues are 'infused', instilled in a person by an act of God's grace. The infusion need not lead to success: a person can freely and culpably fail to respond to and develop the theological virtues. Aquinas claims that even though faith, hope and love are infused simultaneously, faith and hope can develop without the development of love; we then have 'unformed' or 'dead' faith. Love, however, cannot develop without the development of faith and hope, even though the blessed in heaven retain love but no longer have any need for faith or hope. In contrast to point (2), even though the theological virtues can be enhanced or diminished, they do not conform to the doctrine of the mean in the way in which the moral virtues do: one cannot believe in, hope for or love God excessively.

2 Aquinas on faith

The theological virtues, on Aquinas' understanding of them, are complexes whose analysis reveals both cognitive and volitional components. This interplay between intellect and will makes Aquinas' account of faith distinctive and subject to criticism. The primary object of faith (*fides*) is God, in so far as he can be grasped by human intellects. Human intellects operate by considering propositions. Some true propositions about God can be known by the intellect functioning within its natural capacities. For example, Aquinas thinks that there are sound arguments, appealing only to the testimony of our senses and obvious metaphysical principles, that enable us to

know the truth of the proposition that God exists. Other propositions about God and God's relation to the world cannot be ascertained by reason and experience alone. Only divine revelation can convey such truths as that the world has not existed forever but was created by God, and that God is triune in nature.

Aquinas reserves the term 'understanding' (*intellectus*) for the intellectual virtue that enables one to grasp self-evident truths. 'Knowledge' (*scientia*) can refer either to the intellectual virtue that enables one to make correct inferences, or to the cognitive state one is in when one grasps a truth by understanding or by inference, or to the body of propositions thereby known. In contrast to the proposition that triangles have three sides, the mere understanding of which compels the intellect's assent, or the proposition that the sum of the interior angles of a triangle is equal to two right angles, which follows deductively from other propositions that are obviously true, the proposition that God is triune in nature is neither self-evident nor a demonstrable consequence of self-evident truths. Yet belief in this and similar supernatural doctrines of the Christian faith is necessary for human salvation. Faith is not identical to understanding or knowledge, because the propositions constitutive of faith are not rationally compelling. An act of will is necessary to bring the intellect to assent to the propositions of faith. The resultant mental state, belief, is not identical with any of the other cognitive states induced by the will, such as opinion, suspicion or doubt, because the latter involve, to varying degrees, an element of psychological uncertainty, whereas belief involves certainty. Aquinas appears to endorse the notion that faithful belief lies between knowledge and opinion. Belief is more like opinion and less like knowledge in so far as the evidence is insufficient to warrant psychological certainty. But because faithful belief nevertheless has no taint of psychological uncertainty, it is in that respect more like knowledge than opinion.

Aquinas believes that the possession of any virtue must be meritorious. The meritoriousness of 'formed' or 'living' faith resides in the facts that the belief is the voluntary assent to revealed divine authority, and that the assent is directed by love for the ultimate good, God. If either the voluntariness or the love for the ultimate good were lacking, faith would not be a virtue.

Aquinas' position, then, is that faith is a voluntarily induced belief whose content is a set of propositions revealed authoritatively by God and typically codified in a confessional creed. The disposition to believe is infused by God. Faith is not knowledge because the intellect is not able by natural means to acquire knowledge of the propositions to which the believer assents. Unlike other voluntarily induced cognitive states, faith entails psychological certainty. Living faith is a virtue because the relevant propositional assent is voluntary and motivated by love for the object of faith, God. Some criticisms of Aquinas' position appear to be compatible with modification and redeployment (see §3 below). Other criticisms are more radical, advocating the abandonment of Aquinas' position (see §4 below).

3 Difficulties with Aquinas' view

Aquinas insists that the virtue of faith cannot be separated from the propositions that give faith its content. Since the propositional content is revealed by an essentially truthful God, one cannot have faith in a proposition that is false. (Thus faith must be distinguished from the ordinary cognitive state of belief.) Moreover, one has faith, according to Aquinas, only if one assents to all the propositions contained in the confessional creeds. To reject some part of the creeds is to fail to regard the creeds themselves as underwritten by divine authority. Thus Aquinas' view entails that all non-Christians lack faith. It also entails that a Christian heretic, who might deny some article of faith while accepting all the others, lacks faith. If one seeks an analysis of faith that is neutral among different religions, one will either have to modify Aquinas' view or look elsewhere.

Aquinas' compartmentalization of various cognitive attitudes contributes to two difficulties for his view, one involving the difference between knowledge and belief, another involving the difference between faith and doubt. On the biblical authority of the Epistle of James, Aquinas thinks that there are demons or malignant spirits who believe various propositions about God. If the virtue of faith is simply a matter of believing those propositions, then the demons would appear to have faith, contrary to their diabolical natures. Aquinas attempts to deny merit for the demons' cognitive state by attributing to them intellectual powers superior to those of humans, appearing to suggest that the evidence is so clear for the demons as to make their assent involuntary. If Aquinas accepts this position, then he is forced to concede that the demons do not *believe*; they *know*. Since Aquinas regards knowledge and belief as two separate and incompatible cognitive states, he would then have to gainsay James, whom he acknowledges to be one source of revelation. On the other hand, if the demons' belief is voluntary, then Aquinas'

account of faith would seem to confer merit on their belief.

Because faith as a virtue is a disposition that entails psychological certainty, and doubt entails lack of certainty, it is impossible for Aquinas' believer to harbour any doubts about the content of faith. Aquinas' account thus has the consequence that believers who struggle to hold on to their religious convictions in the face of lingering doubts simply do not have faith at all. In the light of this, one might seek to deny Aquinas' requirement of psychological certainty.

Aquinas' view presupposes that, to some extent, what people believe is within their voluntary control. Aquinas does not believe that all beliefs are voluntary: the verdicts of understanding and knowledge, in his technical senses of those terms, are not subject to the will. One might wonder, however, whether any beliefs can be voluntarily induced, and, in particular, whether religious beliefs can be adopted as a matter of conscious decision, as Aquinas' doctrine requires. It is unclear whether Aquinas thinks that someone infused with faith must be able to come *directly* to will to believe, or that infused faith allows for the *indirect* development of belief by the will. Consider this analogy. A person might realize that they would be happier if they did not believe that others were conspiring against them, yet be unable to eradicate the belief simply by willing it away. Nevertheless, they might be able to take small steps, such as associating cautiously but more freely with others, which would have the indirect and cumulative effect of weakening and eventually dislodging the paranoid belief. Similarly, a person might be able to embrace religious belief by associating with believers and emulating their practices. Even if no one can directly will to believe, it may be enough for an account of faith like Aquinas' that one be able to nourish infused faith by such indirect means.

4 Alternative conceptions of faith

Martin Luther's articulation of faith has been traditionally interpreted as a rejection of any view that maintains that faith is a cognitive virtue (see Luther, M.). It would seem that if faith is a virtue, then its possessors have the power to make progress towards achieving salvation on their own. But Luther insists that personal salvation can only be attained through the recognition that one's sinful state makes one incapable of living righteously. Nor is faith primarily cognitive. A person of faith believes that various propositions about God are true, but those beliefs are subordinate to trust in God, which for Luther is the core of faith. To trust in God is to resign oneself to the will of God, a resignation that is precipitated by awareness of one's own helplessness and lack of merit. But even the resignation is not under one's voluntary control: Luther views it as a gift from God. Luther's insistence on 'justification by faith alone, not by works' epitomizes his view that faith is the only path to salvation (see Justification, religious §4).

Some observers have argued that the differences between Aquinas' and Luther's accounts of faith are not as great as they may first appear. Luther claims that love is a necessary consequence of faith, whereas Aquinas regards living faith as faith informed by love. For both accounts, then, genuine faith entails love of God and neighbour. Even so, Aquinas and Luther appear to differ about the status of hope (see §5 below).

The implications of treating faith as absolute trust in God are pursued further in the writings of Søren Kierkegaard (§§4-5). Aquinas' view allows faith's cognitive content to extend beyond the content accessible to natural reason while remaining compatible with it. Many of Kierkegaard's remarks can be interpreted as an attack on such a view, on the grounds that it underestimates the radical 'leap' that religious faith requires. To conceive of faith as somehow continuous with natural knowledge is to succumb to the temptation to base faith on evidence, whether that evidence be historical (such as the testimony of miraculous events) or scientific (such as the evidence that the world is only finitely old). But the evidence will always be less than conclusive, whereas the passion of faith is infinite. Kierkegaard thinks that as long as one is guided by canons of objectivity, under conditions of incomplete or ambiguous evidence one will endlessly defer forming a religious conviction, refusing to take the 'risk'. In fact, Kierkegaard thinks that from the point of view of natural objectivity, faith can only appear absurd. Abraham's complete trust in God, manifested by his unhesitating willingness to sacrifice Isaac at God's command, is for Kierkegaard an admirable example of faith that shows how alien faith is from objective inquiry. Although the differences between Aquinas' and Kierkegaard's views are pronounced, it is not clear whether those differences preclude Kierkegaard from regarding faith as a virtue.

W.K. Clifford provides the classic statement of the opinion that faith is a vice and not a virtue. According to

Clifford, 'It is wrong always, everywhere, and for any one, to believe anything upon insufficient evidence' (1877: 346). A person who subscribes to any belief, religious or otherwise, on the basis of insufficient evidence thereby exhibits the vice of credulity, which Clifford regards as both an intellectual and a moral flaw. It follows from Clifford's position that a religious believer would be free from credulity only if the content of the belief were backed by evidence, available to and entertained by the believer, that is sufficient to warrant the belief. Many contemporary philosophers have denied Clifford's position, arguing that there need be no flaw in believing some propositions more strongly than the strength of the evidence would warrant. Even if this opinion can be sustained, it would take further argument to show that religious propositions can fit into the favoured class of beliefs.

Finally, some philosophers challenge the assumption, common to thinkers as diverse as Aquinas and Kierkegaard, that faith is necessarily distinct from knowledge. The challenge takes form by maintaining that Aquinas' conception of knowledge is overly restrictive, confining knowledge to the systematic rigour exhibited in a treatise on geometry or an axiomatization of particle mechanics. Epistemological reliabilism, in contrast, claims that a true belief is a specimen of knowledge if the belief was produced in the believer in a reliable way - for example, a perceptual belief brought about by means of a perceptual faculty functioning properly in an environment in which it is fit to function. Reliabilists typically insist that it is not necessary, in order for a true belief to count as knowledge, that the believer be in a position to justify the belief. A reliabilist who agreed with Aquinas that faith is divinely infused could regard divine infusion itself as a reliable process. If so, then contrary to what Aquinas claims, the believer's infused faith is a kind of knowledge. A proponent of such a view could still agree on Aquinas' own terms that faith is a virtue: that faith turns out to be knowledge is compatible with its being both voluntary and motivated by love of God.

5 Hope and love

Like faith, hope as a theological virtue has a specific propositional content, namely, that one will survive death and final judgment to enjoy the beatific vision of God. Augustine, in *Faith, Hope and Charity*, claimed that hope (*spes*) is directed only towards good things to be had in the future by the person who hopes. This seems to preclude the possibility that one could hope for the salvation of others. If one can hope only for one's own salvation, then it is not obvious why hope should count as a virtue, conferring moral credit on its possessor.

Aquinas' opinion is that unlike wishful thinking, hope is arduous. First, hope presupposes faith: those who have no beliefs about God's plans for humankind can have no hope that they will be saved by God. Second, even though the theological virtues do not conform to the doctrine of the mean, Aquinas thinks that hope does steer a course between two opposite vices, despair and presumption. Those who despair do not have too little hope; they have utterly abandoned hope, believing that they are too sinful to be an object of God's love. Similarly, presumption is not too much hope; it is rather a rejection of hope as unnecessary, on the belief either that one can attain salvation without God's aid or that God is so merciful that his salvation will extend to those who are unrepentant.

Aquinas' conception of hope is augmented by his remarks on love. He uses the term *amor* to characterize the ordinary notion of love as a passion, reserving the term *caritas* for the kind of love that is a theological virtue. Aquinas appeals to Aristotle's remarks on friendship in the *Nicomachean Ethics* (Books VIII and IX) in order to explicate the notion of *caritas* (see Aristotle §25). The sort of friendship (*amicitia*) that constitutes *caritas* involves three components. First, one must desire the good that the loved thing or person is in a position to provide. Although necessary, such a desire is not sufficient to distinguish *caritas* from *amor*, for the desire can be directed towards animals and inanimate objects, with whom one cannot enter into a relation of friendship. Second, one must wish well for the object of one's desire, seeking to further that person's own interests. Aquinas believes that one cannot literally have this type of desire towards animals, for it presupposes in the object of *caritas* something that animals do not have, namely, freedom of will concerning the disposal of interests. The satisfaction of the first two components is compatible with one's love remaining hidden or unrequited, and is therefore insufficient for an analysis of *caritas* as friendship. The third requisite component is that *caritas* be shared and communicated among those who participate in it. The first component, supplemented by the principle that one's love should be proportionate to the goodness of the object loved, undergirds Aquinas' claim that *caritas* requires that one love God more than anything else, including oneself, because God is the supreme good and source of all other goods. The second component allows Aquinas to extend *caritas* to other persons, including one's enemies, inasmuch as all persons are created with good natures. The second component thus explains how one can hope for the salvation

of others: if one is united to others by *caritas,* one adopts their ultimate best interests as one's own.

Aquinas' remarks on hope and his depiction of love as involving friendship between God and person reflect a guardedly optimistic conception of the human situation with respect to God. This conception appears to be irreconcilable with views expressed by Luther in his *Lectures on Romans* (1515-16). 'Pure love' of God, which Luther regards as the highest state a person can attain in this life, entails hatred of oneself, based on an awareness of one's inability to avoid sin and of God's detestation of all sinners. Luther's notion of pure love implies that even if hope is a virtue, it is not necessary for salvation and that despair need not be a vice. Moreover, it is hard to see how love of others can be a virtue for one who has pure love of God: if one hates oneself and realizes that all other are equally detestable, then one should hate them also.

Theology, political

The concept of political theology was the subject of important controversies in European, and especially German, philosophy, social science and jurisprudence in the twentieth century. After the First World War, a debate took place between the jurist Carl Schmitt, an influential right-wing critic of parliamentary democracy in the Weimar Republic, and the theologian Erik Peterson. Another debate was occasioned by a new, leftist political interpretation of biblical texts in the years after 1960. In that context, 'political theology' designates philosophical positions influenced by neo-Marxist philosophies, such as the critical theory of the Frankfurt School. The earlier controversy between Schmitt and Peterson played a role in this later debate as well. Johann Baptist Metz is probably the most important representative of political theology in the later controversy.

In his writings on the problem of the legitimacy of the modern state and its constitution, the jurist Carl Schmitt focused on the question of sovereignty. In his view, the sovereignty of the modern state is derived from an earlier theological tradition centred on God's existence and nature. The modern theory of the state, Schmitt held, had shifted the idea of God's omnipotence, which theologians understood as determined only by God's goodness, to the concept of the sovereignty of the people. Rousseau (§3), for example, had described 'the general will' as the expression of the absolute will of a state's citizens, which could never be wrong or evil. The problem is that when reference to transcendence is abandoned, the notion of the state that remains is despotic, as, for example, in Hobbes' *Leviathan* (see Hobbes, T. §7). To describe the fundamental condition of modern politics, Schmitt introduced the notion of a situation of exemption. In a situation of exemption, radical political movements and charismatic leaders are allowed to annul laws simply by a decision to do so. Schmitt articulated a principle which helped to support both left- and right-wing political messianism: 'Authority, not truth, makes law'.

The most important opposition to Schmitt's account of the political theology of the modern state did not arise either from classical theories of natural law, in the Aristotelian or Thomistic traditions, or from a Kantian theory of law as based on arguments supported by practical reason. Instead it came from a theologian, Erik Peterson, who had converted to Catholicism from Protestantism. Peterson emphatically rejected Schmitt's understanding of the voluntary character of law as theological. He based his argument against Schmitt's position on historical as well as philosophical grounds. He pointed to the decision of the early Church to reject Arianism and to accept the doctrine of the Trinity. One of the consequences of this position was set out by Augustine, Peterson thought. In his *De civitate Dei (City of God)*, Augustine rejects a version of political theology which he thinks he finds in Eusebius of Caesarea; instead, Augustine maintains that there is and must be a separation between the City of God, on the one hand, and the earthly city, or state, on the other. In Peterson's view, this Christian position effectively undermines any possibility of a political theology of the sort Schmitt propounded.

After the Second World War, the Catholic theologian Johann Baptist Metz established a new version of political theology. In the 1960s, and especially during the time of Vatican II (1962-5), the Catholic Church was engaged in a process of reform and was searching for a renewed dialogue with the society in which it found itself. Metz's political theology was part of this larger trend. Metz took a positive view of the Enlightenment and modern freedom of thought, and saw his position as a legitimate consequence (supported by biblical studies) of modern anthropology. Like his teacher Karl Rahner, Metz was concerned to bring the work of Thomas Aquinas into contemporary philosophical discussion. In his earlier writings, Metz also followed Rahner in trying to integrate Kant's transcendental philosophy and German idealism in general with the philosophical presuppositions of systematic theology. These efforts significantly transformed the Neo-Thomist account of human nature.

Metz's political theology was also based on a critical understanding of Kant's account of human freedom and Marx's concept of history. To some extent, it was influenced also by the views of Horkheimer and Adorno, who were critical of the Enlightenment and of modern theories of rationality, and by Benjamin's view of history as 'one single catastrophe where we perceive a chain of events' (1950, Thesis IX). So understood, political theology constitutes an important theological theory of modern times. At its heart, there is the concept of an eschatological reservation with regard to all stages of progress and emancipation in history. This feature of Metz's political theology allows it to avoid the sort of mistakes for which Peterson reproached Schmitt.

Theology, Rabbinic

The Talmud, a shelf of folio volumes built up out of the expansive reflections of generations of scholar/thinkers whose discourse formed a commentary or complement (Gemara) to the ancient legal code of the Mishnah, encapsulates rabbinic sayings and discussions dating from before the first century to around 600. The monotheistic idea of God affords a key perspective on the Talmud's variegated themes: God's uniqueness and ultimacy preclude any easy direct commerce between the human and the divine. Literal contact may be endlessly deferred; yet God remains ever present and ever active in human life. Rabbinic thought, textually represented in the Talmud and in the institutions it fosters, seeks to mediate God's 'absent presence' to a community of believers in a way that renders manifest the penetration of divine concern into every cranny of human consciousness without compromising God's transcendence or explanatory uniqueness.

1 The rabbinic framework

The location of the believer *vis-à-vis* the God of Israel is elegantly captured in the Talmudic dictum: 'Everything is in the hands of Heaven except the fear of Heaven' (Babylonian Talmud (B.T.) Berakhoth 33b; Megillah 25a; Niddah 16b). Everything falls under God's sway, but only human beings can decide whether or not to hold God in awe. Whatever occurs in the world comes under the purview of the monotheistic God - except the affirmation of his role as God. The concatenated system of beliefs and practices that constitute Judaism works only through such acknowledgement of God as creator and ruler of the universe.

The unbridgeable conceptual gap between God and ourselves presupposes a critical epistemology readily capable of registering the inadequacy of our knowledge claims about God. It delineates the outermost limits of defensible human utterance and locates God beyond those limits. The pattern of argument parallels that of philosophical scepticism in urging that whole species of statements exceed the bounds of coherence. But where scepticism introjects its critique, negative theology projects it outward, onto God (see Negative theology).

Since all descriptions of God here are irresolvably metaphoric, it is only human accetance of God's centrality that sets the religious life in motion. All discourse about God is ultimately metaphoric. Its 'cash value', the only 'hard currency' for which invocations of God can be exchanged in the end, is the act of human consent that establishes God's sovereignty in our lives, acceptance, as the Talmudic rabbis call it, of the yoke of the kingdom of Heaven (God, concepts of).

For the rabbis the supreme mitzvah or divine commandment is the study of Torah - both the written law of Scripture and the oral law of the rabbinic canon itself (B.T. Shabbat 127b). The centrality of the monotheistic idea helps to explain this privileging of the intellectual in a system that is, by and large, practical, even pragmatic, in orientation: The rabbis find spiritual elevation, even rapture, in the intellectual cultivation linked with the study of Torah, its norms and intricacies. Having no tangible object of religious devotion, we pursue the Infinite through unending occupation with God's word, will and law, ceaselessly testing the limits of our rational faculties, trying again and again to transcend literalism and probe the nexus between symbol and object that is the genesis of metaphor. The outward and upward movement towards a grasp of the divine thus converges with an inward and downward movement, towards self-reflection, integrating the lessons of the limitations of reason.

2 Rabbinic norms

Rabbinic ideas of the good life reflect the metaphysical priorities evoked by the monotheistic idea. The rabbis look with sharp disapproval on a life of asceticism (see Asceticism). One who merely refrains from drinking wine, they observe, is deemed a sinner against the self (B.T. Nedarim 10a) - how much more so those who refrain from marriage! The Sages (as the ancient rabbis are often called) warmly echo Isaiah's words about the earth, that God 'created it not a waste, He formed it to be inhabited' (Isaiah 45: 18; B.T. Yevamot 62a): divine transcendence does not empty the world of value, since the world is God's work; but it does mean that our guidelines to human perfectibility must emerge from a sensibility informed by an enlightened understanding of our concerted interactions with one another and with our natural environment. Such guidelines are not simply vouchsafed to us - not even by revelation. Just as monotheism continually thrusts us back upon our own intellectual resources theologically, so too does it prod us persistently to refocus on the ways in which our existence in the world can be

made better by greater attentiveness to the norms and limitations of the human condition. Monotheism does not urge us to abandon these norms or transcend these limitations by some lurch into an Ethical Beyond; it does not countenance notions of a transmoral imperative or teleological suspension of the ethical.

Six times in the Talmud (for example, B.T. Shabbat 63a) the prominent rabbinic Sage Samuel emphasizes that only Israel's subjection to the nations distinguishes historical time from the Messianic age. The remark is highly evocative of the rabbinic perspective: since it indicates that human success in reaching the consummation of history has no overtly miraculous emblem by which it is to be judged: monotheism does not give us the mind of God to read. There are human initiatives and reconsiderations but no end-stage within sight that can be declared to have God's full sanction, no Hegelian or Marxian final stage of history, until the parameters of history themselves have been transcended (see History, philosophy of).

We approach God not by theorizing but by continual mobilization of our energies and will, orienting ourselves towards what we can grasp of our canonical texts and thereby, in the course of time, improving human lives and the world. But the Judaic stress on fulfilling God's commandments goes hand in hand with affirmation of what we might call partial redemption. Judaism is deeply suspicious of human claims to have attained complete redemption. The inaccessibility of God redirects our energies towards this world - and so towards events whose outcomes, inevitably ambiguous and partial, spur us to further action, *since they are never validated supernaturally as the sufficient consummation of human effort and achievement*.

3 Action and intention

A recurring controversy in the Talmud (for example, B.T. Rosh Hashanah 28b) addresses the question whether religious obligations need to be fulfilled with deliberate intention. That such an issue could even be disputed is highly illuminating. The rabbis view with equanimity the prospect of assigning primacy to actions whose motives, in an underlying network of thoughts and feelings, are not perfectly defined. Two reflections on the monotheistic idea shed light on this rabbinic stance. First, as we have seen, the conceptual non-negotiability of the monotheistic God makes all human formulations about Him rebound into metaphoric approximations whose major point of intersection with our reality is pragmatic. If what we are comparing - and what we are comparing it to - can never be fixed as divine unreservedly, then our frame of reference in assigning content to our statements about God remains irredeemably human. For example, God is conceived by us relationally - that is, through his actions - as creator of the world, not as he is in himself. Human beings, correspondingly, are invisible to ourselves and others, and are known, if we can be known at all, only through what we do, not through what we think or feel. Second, since action is as metaphoric in relation to God as are the categories of thought and feeling (its primacy in a monotheistic vocabulary merely reflecting the impossibility of our penetrating God's interiority - God's thoughts and feelings, as it were) monotheistic 'action', when viewed as a registering of human possibilities, would be, correspondingly, much more amorphous than our traditional concepts of action would suggest. It might invoke no more specific a reality than that of power - where everything that we utter, think, feel, or do constitutes an assertion of power, but where the familiar demarcations of thought and action, expression and intention become blurred. It is perhaps for this reason that the rabbis can at times seem rather cavalier about thoughts and feelings in the performance of *mitzvot* - not because they denigrate human intentions but because intentions themselves have been absorbed in a broader ontology. Some rabbinic authorities (for example, Abraham Danzig, Hayyei Adam 68: 9), consider the mere engagement in the performance of a mitzvah a sufficient registering of intention; they see no further need for an explicit or separate mental articulation of intention.

4 Progress and retrospection

Two famous themes of rabbinic exegesis seem to point in conflicting directions. The first is the notion of 'It is not in heaven' (Deuteronomy 30: 12) as expounded in the Babylonian Talmudic tractate Baba Metzia 59b, where the biblical dictum about the accessibility of the law is taken to assign to human inquirers the power and responsibility to interpret (and elaborate) it. The other is the idea that 'Even what a conscientious student is destined to say before his teacher was stated to Moses at Sinai' (Midrash Vayikrah Rabbah 22: 1). The first statement conjures up images of irreversible forward movement, in which we are thrust upon our own resources, however paltry, to structure and organize a *halakhic* (Jewishly mandated) life. The second suggests preformation rather than evolution and an inevitable retrospection or even backward movement.

One strategy for reconciling these two texts is to say that the principle of 'It is not in heaven' does not ordain a strictly linear and irreversible development of Jewish law, but something more dialectical and more nearly akin to Hans-Georg Gadamer's hermeneutics. Gadamer argues for the contemporaneity of all texts, their essential incompleteness, subject to the fusion of horizons between an author and all subsequent generations of readers. Yosef Hayim Yerushalmi in his book *Zakhor* (1982) similarly argues eloquently for an unbridgeable tension between the ever-dynamic practice of Torah and the more positive, diachronic demands of ordinary historical writing. For historical writing, the narrative sequence moves irreversibly from past to present. The uniqueness and separateness of the past are preserved forever. But, in the perspective of the Sages, the movement, at least as momentously, is from future to past - so that time forms a seamless web with no sharp chronological divisions. Later interpretations fill in the content of the original teaching, retroactively. The past remains present as a reservoir of legitimation for the expansion of meaning; the future constitutes an inevitable resource for the extension of meaning and reference. The hermeneutical principle of the underdetermination of meaning by text becomes a cardinal rabbinic tool for balancing the authority of precedent and the demands of crisis and creativity (see Hermeneutics, biblical).

5 The underdetermination of meaning by text

As the few examples cited here clearly suggest, biblical and earlier rabbinic texts are often quoted out of context in the Talmud, stripped of their original significations and outfitted with wholly new connotations germane to matters at hand. By such unremitting recontextualizing, the Talmud makes texts speak to ever new issues. What is the significance of this pervasive Talmudic device based on the underdetermination of meaning by text?

From a purely practical standpoint, recognition of the underdetermination is a key factor in rabbinic innovation, allowing the application to unanticipated circumstances of ideas, methods and principles well established in Jewish law.

Hermeneutically as well, the recognition of underdetermination introduces an element of complexity into the idea and the project of historical continuity and faithfulness. A good part of what the Talmudic Sages were doing was consciously to subvert a slavishly historical approach to biblical texts and rabbinic precedents. The rabbis work and play with the texts, almost endlessly reinventing them. The Talmud thus contains an ineradicably storytelling element, even in the most austerely legal discussions. Thus, paradoxically, to give a historically faithful account of a Talmudic discussion or legal analysis, one must somehow accommodate historiography to the Talmud's own resolute anti-historicism.

A jarring theological issue emerges from the centrality of the underdetermination principle in Talmudic exegesis. For this principle points towards scepticism and seems to destabilize all interpretation. Once scepticism is unleashed with regard to the textual sources of Jewish tradition, how can it be contained with regard to the norms that those texts enunciate? The tension between the demand to conserve the Torah's norms and the pressure to decontextualize them (whether as expressed in the Torah text or in its canonical offshoots among the codes), so as to make the underlying norms relevant in transformed contexts - temporally extending the normative reach of the Torah in the broadest sense by way of skeptical strategies of underdetermination - has profound implications for the project of the rabbis as founders and exponents, and, in a sense, reinventors, of Jewish tradition.

The same underdetermination illuminates the priority assigned to speech over writing in Talmudic discourse. It was only by reference to the pressure of persecution that reduction to writing was deemed permissible (B.T. Berakhot 54a). Even then, apparently, it was expected that the writing should resemble speech as closely as possible, by remaining dialectical in structure and even in diction. Texts can engender an illusion of fixity and finality that orality continually belies. Only speech, it seems, is deemed in good faith; writing is always in bad faith. The fact of persecution and the risk of the utter loss of collective memory permits recourse to writing. But dialectical writing, with its tentativeness and recursiveness, its continually interrogatory aspects, presents itself as the mere record of living speech.

A contrast is often drawn between the Talmud's legalistic mode of argument and the methods familiar to philosophers. The Talmud is practically oriented, we are told, where philosophy is theoretical. But in the light of our present analysis, that dichotomy loses its force. The vast canon of Talmudic-legalistic argument itself insinuates a monumental philosophical project.

Articulation simultaneously constitutes erasure, effacing the very possibilities that have just been spoken. What each speaker says can always be decomposed and reconstituted along lines other than those in which the words seemed officially to be pointing. Sentences continually posit their silent others, as dialectical alternatives, and as presuppositions and implications that can always be regrouped and rearranged to yield new configurations of meaning and unsuspected, but possibly hinted, constellations of referents. The whole notion of the primacy of intention is thus reverently mocked, as dicta are made precedents or pretexts for understandings far removed from their literal or naive or historical imputations. Talmudic argument, viewed from this perspective, constitutes one of the most imposing rhetorical edifices ever erected in defence of the notion of the 'floating statement' and the endless process of de-contextualization and re-contextualization.

The theological backdrop for all Talmudic argument is the fabric formed by the tenets of monotheism. The very utterance of the word 'God' initiates a process of endless displacement that finds no resting place. All we can ever do towards assigning a content or pinpointing a sense for this word is to say, without letup, that God is not literally to be construed in this way or that, not to be found in a humanly cognizable sense here or there or elsewhere. Talmudic discourse itself mimics this elusiveness; its stability and steadiness of focus through the endless process of deconstruction and reconstruction refuses to come to rest in some merely fixed and positive content. The deliteralizing of positive ascriptions to God of particular attributes is translated in the Talmud - with its continually rendering fluid of the sense and reference of human utterances - into an implicit acknowledgement of the ultimate ungroundedness of all mere acts of language. In this negative sense, God for the Talmudic speakers and editors becomes the paradigm case of the humanly sayable.

Theophrastus (*c*.372-*c*.287 BC)

Theophrastus, the pupil and successor of Aristotle, shared all the latter's interests, and produced a large number of works on the same topics. Some, like the extant botanical works, went far beyond Aristotle, and Theophrastus is known as the Father of Botany; others amplified and criticized what Aristotle had done. The short Metaphysics, also extant, raises many questions about the nature and the possibility of metaphysics, but most of his work on logic, science, psychology, ethics, politics and religion survives only in fragments, some material coming from the Arabs, and some only from medieval Latin sources. His developments of modal logic and various forms of the syllogism were regarded as important, and his amplification of Aristotle's account of the human intellect was studied in the Middle Ages in the West. His little Characters, an entertaining set of sketches of human peculiarities, has had considerable influence on later literature, and his surveys of earlier opinions, of which his On the Senses survives, influenced later doxographers. He was an older contemporary of Zeno, the founder of Stoicism, but his influence on Stoicism remains uncertain, and we also know little of his relationship with Epicurus.

1 Life and writings

Theophrastus was born in Eresos on the island of Lesbos, but went to Athens for higher education and became the pupil and then the constant companion of Aristotle, whom he succeeded as head of his school, the Peripatos, in 323 BC. He probably shared Aristotle's sojourns from 348 onwards in Assos, Lesbos and Macedonia, where Aristotle taught the future Alexander the Great, and returned with him in 335 to Athens, where most of the rest of his life was spent. He was succeeded by his pupil Strato (died *c*.269 BC). He shared all Aristotle's interests, and wrote widely in a very careful style. Diogenes Laertius lists over 200 of his works. His two botanical works, known popularly as the *History of Plants* and the *Causes of Plants*, have survived, as well as his *Characters*, an entertaining and widely influential work, whose original purpose is uncertain: it seems to have influenced the playwright Menander, himself a pupil of Theophrastus, and may have rhetorical, ethical or theoretical purposes. It enjoyed considerable vogue in the seventeenth and eighteenth centuries, particularly in France. There survive also the short *Metaphysics*, and a number of treatises on scientific matters, but much more survives only in fragments. It is likely that he and his fellow Peripatetic Eudemus worked out their logical theories while Aristotle was alive, but other material presupposes the existence of Aristotle's works as we have them now, which suggests that it was produced after his death. A large part of it was concerned with questioning, widening and improving the works of Aristotle, and Theophrastus himself probably played a part in editing Aristotle's lectures into the form in which we now have them. It is also likely that through his pupil Demetrius of Phalerum he had some influence on the direction taken by the Library and Museum of Alexandria. His contemporary Epicurus wrote a work addressed to him (fr. 280), but we know little else about his relations with either Epicurus or the Stoics.

2 Logic and grammar

Theophrastus made a number of contributions to logic (see Logic, ancient §4). He added a few footnotes to Aristotle's system of categorical propositions, such as a new account of the relations between the second and third figures of the syllogism and the first, and a study of the basis on which the premises of a syllogism are themselves to be accepted (fr. 94). The invention of the fourth figure of the categorical syllogism has been ascribed to him, mistakenly, but he did add a number of additional moods to those recognized by Aristotle (frs 91-6). He went much further in attacking Aristotle's unsatisfactory system of modal logic, working closely with his contemporary, Eudemus. For this, evidence from Arabic sources goes beyond what we have from the Greeks (frs 98-109). Aristotle held that in a modal syllogism, which uses the notions of 'necessary', 'actual' or 'assertoric', and 'possible' in its premises and conclusions, one of which might for example be 'All men are possibly good', the mode of the conclusion follows that of the major premise. But his pupils saw flaws in that position and suggested that the conclusion always follows the mode of the weaker premise: that is, if one premise is necessary and the other assertoric then the conclusion is always assertoric, whichever of the premises is. This also involved revised accounts of the meaning of terms such as 'necessary' and 'possible', and of the conversion of propositions. 'Some *A* is *B*' implies 'Some *B* is *A*', but if *A* possibly belongs to no *B*, does *B* possibly belong to no *A*? Aristotle argued against this, but Theophrastus and Eudemus produced a proof that it does.

Theophrastus also developed some remarks of Aristotle into a theory of prosleptic syllogisms, such as ‘*A* is said of all of that of all of which *B* is said’ (fr. 110), and with Eudemus worked out a theory of hypothetical syllogisms (frs 111-13), such as ‘If virtue is knowledge, it is teachable. But it is knowledge. Therefore it is teachable’, the relation of which to Stoic logic is controversial. Finally, he revised Aristotle’s system of topics, and gave some definitions of key terms such as ‘topic’.

He also made advances in the theory of grammar, which Plato and Aristotle had begun by recognizing nouns and verbs. Theophrastus added ‘joints and ligaments’, which probably included conjunctions, prepositions and articles, and he also paid attention to aspects of style (fr. 683).

3 Psychology

For Theophrastus’ psychology we have evidence from Themistius (fourth century AD) and Priscian of Lydia (sixth century AD) which provides a considerable proportion of Theophrastus’ *On the Soul*, a work devoted mainly to a critique of Aristotle’s own *On the Soul*. Curiously, Priscian used Theophrastus as a peg on which to hang his own Neoplatonic account of the same subject matter, sensation, imagination and thought. Theophrastus laid the ground for future work by bringing material from Aristotle’s *Generation of Animals* into discussion about the origin of soul and intellect in the embryo. In the field of sensation he worried over Aristotle’s claim that in sensing the sense organ becomes like its object (see Aristotle §18), for it could hardly become like it in colour or taste, for example, so he fastened on Aristotle’s references to form and *logos* as explanations of this process, and considered detailed aspects of sensation, such as light, colour, reflections and the transparent. Where Aristotle is obscure he can be obscure himself, as in the section on why there are only five senses. He also found difficulties in Aristotle’s condensed account of intellect (see Aristotle §19; Nous), asking how intellect differed from matter, for both seemed to have no characteristics in themselves; and how intellect and its objects, the thinker and its thoughts, could causally affect one another. He seems to have distinguished intellect from matter by saying that while matter receives individual forms intellect receives universal forms (fr. 308). He insisted again and again on the importance of using language appropriately, to avoid being misled, accepting that we have sometimes to transfer words appropriate primarily to one subject matter to another subject matter; this can be done successfully provided we are aware of what we are doing.

In his epistemology, if Sextus Empiricus (second century AD) is correct, he provided an empiricist theory of knowledge (fr. 301A) similar to that given by Aristotle at the end of his *Posterior Analytics*. He stressed the importance of self-evidence as a criterion of truth, and claimed that both sensation and thought are foundations of knowledge.

4 Metaphysics

Theophrastus’ *Metaphysics*, now generally agreed to be a complete work in itself, is a critique not only of the views of Aristotle but also of those of Plato and other philosophers. In particular it deals with themes in *Metaphysics*, Aristotle’s ‘theological’ work, and it has been argued plausibly that it was an early work of Theophrastus. Its original title is unknown: ‘First Philosophy’ would be appropriate. It has been seen as the classic formulation of a whole complex of problems. First he tackles some of the assumptions made by Aristotle, starting with the claim that there exist ‘first things’, known by reason. These must be either in mathematical objects, or in something prior to them; they are the cause of motion, but are themselves unmoved; as objects of desire they cause the rotation of the heavens. In all this he is following Aristotle, but he then asks how many they are: if there is only one, why do the heavenly bodies move differently, but if there are more than one, how is their influence harmonized? And why does love of the unmoved cause movement as an imitation? Further, if the heavenly bodies have desire, they must have soul, and the movement of soul, which is thought, is better than rotary movement.

After a criticism of Plato and his successor, Speusippus (died 339 BC), for not carrying through their accounts of the nature of the world into a complete system, he suggests that perhaps metaphysics is only concerned with first principles. But then what are these principles? He appears to consider two kinds: the ultimate entities out of which things are made and the general laws by which all things are governed.

Turning to details, he considers various basic notions, form and matter as conceived by Aristotle, good and evil, being, and how various kinds of being may be known. He wonders why there is so much evil in the world. On a

lower level he considers cases which seem to lack final causes, such as floods and male breasts. These raise difficulties for Aristotle's claim that nothing happens without a purpose. Theophrastus suggests that perhaps these anomalies result automatically from the rotation of the heavens, or perhaps there is a limit to purposiveness and the desire for what is good. Recently discovered Arabic texts show him arguing that god is responsible only for order in the universe, and that things like thunderbolts are not sent by god.

It is possible that the later lack of interest in metaphysics in the Peripatos is due to Theophrastus' devastating criticism. Certainly his successor, Strato, was primarily interested in science.

5 Theology and religion

For Theophrastus' theological views, apart from what is mentioned above, we are dependent on later writers. Cicero (106-43 BC) says that he identified god with heaven and with mind or spirit, but his evidence is superficial. Albert the Great (thirteenth century) says that Theophrastus argued that god had no will, giving five detailed arguments (fr. 259) which may however owe much to Arabic developments, and that the relationship between god and the intellect is like light. Denis the Carthusian (1402-71) suggests that he was the founder of negative theology (fr. 260), saying that we know better what god is not than what he is. It also seems that he wrote about *daimons*, the beings supposed to exist on a level between gods and mortals (see Platonism, Early and Middle §7). Porphyry (mid 3rd-early 4th century) gives us long excerpts from a work which may be his *On Piety*, which are largely on what types of sacrifice are appropriate to the gods, and advocate vegetarianism (frs 584-5).

6 Ethics

Much of the evidence for his ethics is trivial, but Porphyry gives us sections from his attack on meat eating, probably slanted to suit Porphyry's own interests, and Jerome quotes from his very funny attack on marriage, in order to support Christian views on chastity (fr. 486). We also have Theophrastus' doctrine of the natural kinship of all human beings and, more, of human beings and animals, because of their physiological and psychological similarities - sometimes known as the doctrine of *oikeiotēs* (frs 531, 584), though it is still debated whether it is related to the *oikeiōsis* of the Stoics (see Stoicism §14); also his attack on Plato's account of false pleasure in the *Philebus* (fr. 556), where he stresses the importance of language. There is also evidence that he had new ideas about emotions (frs 438-48), in particular using the notion of 'the more and less', that is, differences in degree, to relate similar emotions such as anger and rage. He attained some notoriety among the Romans for holding a less austere view of how virtue and happiness are related than did Aristotle (and after him the Stoics), saying that a happy life does not lie in virtue alone (fr. 497). His three books on friendship had considerable influence, but little now survives (frs 532-46).

7 Science

The line between philosophy and early science is difficult to draw, and his work in botany and biology contains both empirical work based on observation and attempts at establishing theoretical foundations. The opening of his *Physics* gives an account of the fundamentals of natural science, that natural bodies are composite, and have elements and causes and principles, and he goes on to place (criticizing in detail Aristotle's odd account; frs 146-9), time (relating it, like Aristotle, to motion; frs 150-1), motion and change. His remarks on place, at least adumbrating a relativist view of space, have been given great significance by some scholars, but it is more likely that as usual he was raising more problems than he answered. Large sections of a work in which he stated and refuted in detail several arguments of his predecessors against the eternity of the universe are preserved by Philo of Alexandria (frs 184-5). He extended Aristotle's work in zoology with studies of the nature and habits of many creatures, and focused in particular on peculiar phenomena such as swarming and hibernation, trying to show that these had a natural explanation. In botany he applied to plants the principle of classification originally developed by Plato, but further developed by Aristotle. The opening of the *History of Plants*, or better, *Inquiry into Plants*, attempts to list the parts of plants, stem, root, leaf, flower and so on, and later there is a division of plants into trees, shrubs, undershrubs and herbs. In *On the Causes of Plants*, or better, *Plant Explanations*, he covers aspects of the growth of plants, such as methods of reproduction and climatic effects. He built on a mass of information gathered by others, including herbalists and agriculturalists, but also by his own observation, and provided a theoretical framework which lasted for centuries.

In addition there are several short treatises including *On Fire*, *On Stones*, *On Tiredness* and *On Sweating*, and a number of scientific works attributed to Aristotle but not thought to be by him which have by some been attributed to Theophrastus. These include *On Colours*, parts of the *History of Animals* VIII and IX, and parts of the *Mirabilia*.

8 Other work

Theophrastus has also been seen as an influential doxographer and the source of other later doxographies (see Doxography): his *On the Senses* has survived with its treatment of the views of the Presocratics and Plato about sensation, and we have evidence for similar work in physics (frs 224-45).

He followed Aristotle in working on politics (frs 589-665) and rhetoric (frs 666-713), particularly on style (frs 684-704), and wrote some difficult theoretical material on music (frs 714-26).

PAMELA M. HUBY

List of works

Theophrastus (*c*.372-287 BC) Fragments, in W.W. Fortenbaugh, P.M. Huby, R.W. Sharples and D. Gutas (eds) *Theophrastus of Eresus, Sources for his Life, Writings, Thought and Influence*, Leiden: Brill, 1992.(A collection of texts and translations relating to Theophrastus until the fourteenth century, including evidence for his work in logic, science, psychology, theology, religion, ethics, political theory and rhetoric; volume 5, *Sources on Biology*, ed. R.W. Sharples appeared in 1995.)

Theophrastus (*c*.372-287 BC) *Metaphysics*, trans. W.D. Ross and F.H. Fobes, Oxford: Clarendon Press, 1929; repr. Hildesheim: Olms, 1967; trans. M. van Raalte, Leiden: Brill, 1993.(Greek and English text, with notes.)

Theophrastus (*c*.372-287 BC) *Characters*, ed. and trans. J. Rusten Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 2nd edn, 1992.(Sketches of character weaknesses; parallel Greek text and English translations)

Theophrastus (*c*.372-287 BC) *Inquiry into Plants*, ed. and trans. A. Holt Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 2 vols 1916-26.(Botany; parallel Greek text and English translations.)

Theophrastus (*c*.372-287 BC) *Causes of Plants*, ed. and trans. B. Einarson and G. Link Loeb Classical Library, Cambridge, MA: Harvard University Press and London: Heinemann, 3 vols, 1976-90.(Botany; parallel Greek texts and English translations.)

Theophrastus (*c*.372-287 BC) *On the Senses*, trans. in G.M. Stratton, *Theophrastus and the Greek Physiological Psychology before Aristotle*, London: Allen & Unwin, 1917; repr. Amsterdam: Grüner, 1964.(A study of earlier theories of perception. Greek text, translation and notes by an eminent cognitive psychologist)

Theoretical (epistemic) virtues

When two competing theories or hypotheses explain or accommodate just the same data (and both are unrefuted), which should be preferred? According to a classical, purely formal confirmation theory, neither - each is confirmed to the same degree, and so the two hypotheses are precisely equal in epistemic status, warrant or credibility. Yet in real life, one of the two may be preferred very strongly, for any of a number of pragmatic reasons: it may be simpler, more readily testable, more fruitful or less at odds with what we already believe. The philosophical question is whether such pragmatic virtues are of no specifically epistemic, truth-conducing value, or are instead genuine reasons for accepting a theory as more likely to be true than is a competitor that lacks them.

1 Some of the virtues

The preference for simplicity in particular is illustrated by the example of experimental scientists' practice in curve-fitting on graphs: given a set of data points that lie along a straight line, any scientist will draw a straight line through them rather than any more complicated curve, and leave it that way unless further, refuting data should come in. This compelling smoothness of the linear hypothesis is a virtue of some sort, one that is not shared by the hypotheses expressed by the countlessly many more complex curves that pass through the very same data points and hence are just as well confirmed in the classical sense as is the linear theory. (The immediacy and vividness of the curve-fitting example should not be allowed to suggest that 'simplicity' is easily measured, or even that it can be given a clear general characterization - Foster and Martin 1966; Sober 1975 - see Simplicity in scientific theories)

Other pragmatic virtues having simplicity's nonclassical and doubtful epistemic character include: (1) *Testability* - other things being equal, a hypothesis H_1 will be preferred to a competitor H_2 if H_1 has more readily testable implications; (2) *Fertility* - H_1 will be preferred to H_2 if H_1 is more fruitful in suggesting further related hypotheses, or parallel hypotheses in other areas; (3) *Neatness* - H_1 will be preferred to H_2 if H_1 leaves fewer messy unanswered questions behind, and especially if H_1 does not itself raise such questions; (4) *Conservativeness* - H_1 will be preferred to H_2 if H_1 fits better with what we already believe. (If this sounds dogmatic, notice that, inescapably, we never even consider competing hypotheses that would strike us as grossly implausible; for example, no detective considers the hypothesis that the crime was committed by invisible Venusian invaders.) Also, often listed as a pragmatic virtue is 'generality' or *explanatory power*, the property of comprehending more various data than one's competitors; but we have stipulated for the sake of argument that our competing theories comprehend just the same data, and in any case it seems that power is just a wider, more global simplicity.

Every pragmatic virtue is a matter of degree. And our preference for any one of them always comes qualified by 'other things being equal', for clearly they can conflict among themselves. Perhaps the most obvious tension holds between simplicity and conservativeness, since often simplification is gained only through bold overthrowing of previously accepted theory, as in the case of Copernican versus Ptolemaic astronomy. But because of the complexity of any detailed real-world case study, there is no generally accepted policy for weighing the various degrees of the various virtues against each other in any particular inquiry. The lack of such a policy, understandably, has led some epistemologists to scepticism or relativism concerning theory choice based on pragmatic virtues. But there is also a more fundamental issue, outlined in section two below.

2 The spartan argument

It seems we have considerations of two sorts: data or hard evidence bearing a quasi-formal probabilifying or confirming relation to each of the competing hypotheses H_1 and H_2, and the pragmatic virtues attaching differentially to H_1 and H_2. The former is expressed commonly by words like 'likely', 'probable' and 'confirms' in our narrow sense; the model for it is formal inductive logic or confirmation theory based on probability theory, conceived by the Logical Positivists as a strict analogue to deductive logic (see Confirmation theory). Let us call this 'narrow confirmation'. Following mainstream epistemology, let us also use the words 'justified' and 'justification' respectively to mark out the class of beliefs it is epistemically rational to hold, and the relation

between those beliefs and the evidence in virtue of which holding them is rational. The question then arises, ‘is justification exhausted by narrow confirmation?’

The affirmative is emphatically urged by van Fraassen (1980). On that spartan view, the pragmatic virtues are merely pragmatic, a matter of what is utile or convenient and (in Ian Hacking’s phrase) makes our minds feel good; the virtues contribute not at all to justification. It is the spartan view that drives van Fraassen’s and others’ radical scepticism about the unobservable. Unobservable entities are posited or hypothesized at best, so if hypothesis-choice requires appeal to pragmatic virtues and the virtues do not ever make for justification, no belief in unobservables can be justified. It is also the spartan view that drives evil-demon scepticism about the external world: by hypothesis, the evil-demon theory makes exactly the same observational predictions as does the realist external-world theory, so both are equally probable or well-confirmed on our evidence, so we have no reason to believe the external-world theory to the exclusion of the other. Further, the spartan view drives Nelson Goodman’s famous ‘Grue Paradox’, for the problem is that for every well-confirmed hypothesis, say that the next emerald to be observed after a certain future time *t* will be green, there are innumerably many truth-functionally mocked-up competitors that are equally well confirmed, say that the next emerald will be ‘grue’ (either examined before *t* and green, or not examined before *t* and blue) (see Induction, epistemic issues in; Knowledge, concept of §9).

Since the spartan position gives rise to such sceptical quandaries, why not abandon it forthwith and admit the pragmatic virtues’ justificatory power? But one must not simply presume the falsity of scepticism in the face of arguments that to many philosophers have seemed unanswerable. Also, there is a very attractive direct argument against taking the virtues as justificatory.

A first formulation of the argument is this: the virtues’ pragmatic ‘utility’ is really a mixture of corner-cutting convenience - a form of intellectual laziness - and merely aesthetic appeal. We prefer the smoothest hypothesis in curve-fitting because the smooth curve is easier to draw and looks prettier. But why should anyone think that convenience and prettiness count in any way towards truth? Few philosophers would share the Grecian Urn’s motto that beauty and truth are one.

The spartan argument is most compelling for the case of conservativeness. That a hypothesis fits comfortably with what we already believe makes that hypothesis pleasant and attractive to us, but hardly justifies it; for to think it does is to assume that what we already believe is justified merely by the fact of our believing it, and that idea strikes most philosophers as blatantly false - however, see Sklar (1975) and Lycan (1988). The spartan argument is memorably embellished by van Fraassen:

> Judgements of simplicity and explanatory power are the intuitive and natural vehicle for expressing our epistemic appraisal. What can an empiricist make of these… virtues which go so clearly beyond the ones he considers pre-eminent?
>
> There are specifically human concerns, a function of our interests and pleasures, which make some theories more valuable and appealing to us than others. Values of this sort, however… cannot rationally guide our epistemic attitudes and decisions. For example, if it matters more to us to have one sort of question answered rather than another, that is no reason to think that a theory which answers more of the first sort of question is more likely to be true.
>
> (van Fraassen 1980: 87)

Truth is a relation between a theory or hypothesis and the world. But the pragmatic virtues are relations between theories and our human minds, to which relations the world seems irrelevant. The virtues have to do with the roles that hypotheses play in our private cognitive economies, not with anything external to us. Making our minds feel good is hardly a warrant of truth.

Notice that, if correct, the spartan position undermines an entire theory of epistemic justification, that which in this century originated with Quine (1960) and with Sellars (1963, 1973). It is the view that what justifies some (or all) beliefs is those beliefs’ felicitous explanatory relations to others, and since the goodness of an explanation is measured almost entirely by its pragmatic virtues, they are indispensable to the explanationist theory of justification (see Inference to the best explanation).

3 Replies to the sceptic

Two replies may be made to the embellished spartan argument. First, it falsely assimilates the pragmatic virtues to crassly self-seeking 'reasons' for believing things (as in Pascal's Wager, or a case in which we are offered money if we can get ourselves to believe that Mrs Thatcher was Britain's greatest leader ever). The virtues are at least genuinely *cognitive* and, in one important sense, epistemic values. It is fairly easy to see that truth cannot be the only epistemic value. For suppose it were - if the idea, like Descartes', is merely to avoid falsehood, then we could reach our ultimate epistemic goal simply by confining our assent to tautologies; if instead the idea is to believe *all* truths, the goal would be radically unreachable. Fully realizing those things, the truth-centred epistemologist usually alludes to a 'favourable balance of truth over error'. But 'favourable' as regards what? Some further value or interest must be consulted to judge what is 'favourable'. Also, more specifically, it is hardly unreasonable to suppose that beliefs are *for* something, and that cognition has a function. Truth is often called 'the goal of' cognition, but we have just seen that truth cannot be the only goal of cognition; there must at least be something in the way of informativeness, however it might be measured. Since belief is a guide to action, a belief's other pragmatic virtues may also contribute to its overall cognitive goodness. And now the burden is on the spartan to say why justification is constituted by only a subcomponent of overall cognitive goodness, in the face of the sceptical quandaries expounded in §2.

Second, we should advert to the epistemology of epistemology. Epistemology is a study of norms, and (so the present reply goes) the epistemology appropriate to a normative subject is that of 'reflective equilibrium' as first proposed by Goodman (1955) and developed by Rawls (1971). Roughly, we begin with our instinctive normative intuitions and build an accordingly normative theory to systematize them. Mutual adjustment occurs until what Rawls calls 'narrow' reflective equilibrium is reached; then factual knowledge and perhaps also other norms are admitted to the equation, resulting in further adjustment and eventual 'wide' reflective equilibrium. In epistemology, as in ethical theory and for that matter in deductive logic, the intuitions in question are normative to begin with.

On the present view, epistemology starts with the attempt at narrow reflective equilibrium. The move to wide equilibrium will involve attending to empirical cognitive science. But each is likely to respect the pragmatic virtues. For our pragmatic preferences are not merely preferences, but normative practices: we instruct our science students in the techniques of curve-fitting, epicycle elimination and the like, and science would be in a bad way if we did not.

One may or may not be persuaded by the foregoing two rebuttals of spartan scepticism. If not, and if one does not want simply to acquiesce in a radical scepticism about all of nature, one has the task of showing how a classical confirmation theory can overcome the sceptical quandaries without at least tacit appeal to the pragmatic virtues. If one is persuaded, there are three paths: to modify classical confirmation theory in order to respect the virtues; to relegate classical confirmation theory to a confined role in inquiry, granting that justification far outruns narrow confirmation; or to abandon confirmation theory entirely as a bad job.

Roughly the first path has been taken by Clark Glymour (1980). The idea is to broaden the notion of 'confirmation', so that H_1 may be counted as 'better confirmed' than H_2 even though H_1 and H_2 are still equally probabilified by the evidence base. If, however, one wants to demote or abandon confirmation theory entirely, one faces the daunting task of building a systematic account of the pragmatic virtues, their measurement and their comparative interaction - to date, no theorist has taken more than a step or two in that direction.

Theories, scientific

The term 'theory' is used variously in science to refer to an unproven hunch, a scientific field (as in 'electromagnetic theory'), and a conceptual device for systematically characterizing the state-transition behaviour of systems. Philosophers of science have tended to view the latter as the most fundamental, and most analyses of theories focus on it.

The Einsteinian revolution involved the rejection of the chemical ether on experimental grounds. It thus prompted philosophers and scientists to examine closely the nature of scientific theories and their connections to observation. Many sought normative analyses that precluded the introduction of 'fictitious' theoretical entities such as the ether. Such analyses amounted to criteria for demarcating scientific or cognitively significant claims from unscientific or metaphysical claims.

Logical positivism sought to develop an ideal language for science that would guarantee cognitive significance. The language was symbolic logic with the nonlogical vocabulary bifurcated into observational and theoretical subvocabularies. Observation terms directly designated observable entities and attributes, and the truth of statements using them was unproblematic. To prevent postulation of fictitious unobservable entities, theoretical terms were allowed only in the context of a theory which guaranteed the cognitive significance of theoretical assertions. Theories were required to contain correspondence rules that interpret theoretical terms by coordinating them in some way with observational conditions.

In the 1960s this 'received view' was attacked on grounds that the observational-theoretical distinction was untenable; that the correspondence rules were a heterogeneous confusion of meaning relationships, experimental design, measurement and causal relationships; that the notion of partial interpretation associated with more liberal requirements on correspondence rules was incoherent; that theories are not axiomatic systems; that symbolic logic is an inappropriate formalism; and that theories are not linguistic entities.

Alternative analyses of theories were suggested - construing theories as answers to scientific problems or as paradigms or conceptual frameworks. Gradually analyses that construe theories as extra-linguistic set-theoretic structures came to dominate post-positivistic thought. The semantic conception *identifies theories with abstract theory structures like configurated state spaces that stand in mapping relations to phenomena and are the referents of linguistic theory formulations. Depending on the sort of mapping relationship required for theoretical adequacy, realist, quasi-realist or antirealist versions are obtained. Correspondence rules are avoided and some versions eschew observational-nonobservational distinctions altogether. Development of the semantic conception has tended to focus on the mediation of theories and phenomena via observation or experiment, the relations between models and theories, confirmation of theories, their ontological commitments, and semantic relations between theories, phenomena and linguistic formulations. The* structuralist *approach also analyses theories set-theoretically as comprised of a theory structure and a set of intended applications, but is neopositivistic in spirit and in its reliance on a relativized theoretical-nontheoretical term distinction. It has been used to explore theoreticity, the dynamics of theories as they undergo development, and incommensurability notions.*

One's analysis of theories tends to influence strongly the position one takes on issues such as such as observation, confirmation and testing, and realism versus instrumentalism versus antirealism.

1 Background

Part of the mathematically specified content of special relativity cannot be reduced to observations. Logical positivism emerged out of attempts to reconcile that feature with Mach's doctrine that observations exhaust the empirical content of a theory. Exploiting recent developments in logic and the foundations of mathematics such as *Principia mathematica*, the logical positivists concluded that mathematics was tautological and so mathematical portions of scientific theories did not add to their empirical content - a reconciliation called into question by their own later work on pure versus applied geometries.

Joining with this effort was a strongly Neo-Kantian approach to epistemology and metaphysics. Carnap 's *Aufbau* (1928) essentially reworked Kant's 'transcendental analytic': the unique categories and their principles of the metaphysical deduction were replaced by the notion of a nonunique constructional system (*Konstitutionstheorie*)

and the transcendental ego, by a physical person constructed out of subjective experiences. Carnap maintained that this particular constitutional scheme was not unique, and thus that realism, idealism, and his favoured constructional scheme were just different ways of speaking. Insofar as such schemes were valid they were in agreement. The disadvantage of realist or idealist schemes was that they contained language that allowed metaphysical assertions which were not cognitively significant. The advantage of a logically ideal scheme was that only what was cognitively significant could be asserted. Therefore anything legitimate in any other scheme could be translated into a logically ideal scheme. Philosophical analysis became canonical formulation in the ideal syntactical language.

2 Syntactical approaches: the 'received view'

Syntactical approaches analyse theories as *linguistic entities* which are individuated by their syntactic characteristics. Thus alterations in the syntax of a theory (say, by changing the axioms or the language) result in a different theory.

Whitehead and Russell's *Principia mathematica* did not clearly distinguish syntax from semantics, assuming syntactical axioms had a given standard interpretation, and so early syntactical investigations were of interpreted sentences. Thus when positivists syntactically distinguished the observational and theoretical components of a scientific language, the observational portion was presumed to be interpreted; however, the problem of fictitious theoretical entities rendered problematic whether theoretical assertions genuinely referred.

Following constructions in the *Aufbau*, Rudolf Carnap initially construed the observational sublanguage as a sense datum language. Later he switched to the more realistic 'thing' language. Observational assertions were statements about directly observable entities and their attributes. Carnap never attempted rigorous delineation of the observational-theoretical distinction because he viewed it as somewhat arbitrary and probably just a matter of language choice. In the terminology of his 'Empiricism, Semantics, and Ontology' (1950), choice of a language is an external question, but truth is an internal question that can only be raised in the context of a specific language system. Thus demarcation of the observation language from the theoretical language is an external question.

A logically ideal scientific language trifurcated its vocabulary into the logical, *observational* V_O and *theoretical* V_T. The observational sub-language consisted in sentences using just V_O augmented by the logical, and the theoretical sublanguage utilized V_T and logical terms. *Mixed sentences* contained both observational and theoretical terms. Observation language sentences were fully interpreted, whereas theoretical assertions depended on the theory for their interpretation. The laws, *T*, (axioms in the theoretical language) *implicitly defined* their terms by imposing relationships that restricted potential interpretations. Mixed language *correspondence rules C* infused observational meaning into the theoretical terms, so that the interpretation of theoretical assertions was a function of implicit definition and infused operational meaning. The theory consisted of the conjunction *TC*.

Since implicit definition restricted but did not fix referents for theoretical terms, the empirical referents of theoretical assertions depended essentially on the standard interpretation of V_O mediated via *C*. Initially the *C* were *explicit definitions* that identified the content of theoretical assertions with complex observable conditions. Existence of alternative procedures for defining the 'same' concept and problems in capturing the logic of dispositional terms using symbolic logic led to the more liberal requirement that the *C* be *reduction sentences* partially defining theoretical terms in the context of a particular experimental set-up as characteristic outcomes to stimuli. Difficulties in giving observational interpretations to theoretical terms such as the ψ function in quantum mechanics and real valued measures led to allowing *C* to be *interpretive systems* that do not individually coordinate V_T terms with observable conditions, instead requiring that their inclusion in a theory make a difference in the theory's observable predictions.

Figure 1 will help clarify the differences in these proposals. When the *C* were required to be explicit definitions, theoretical assertions were guaranteed to refer to observable reality within *TC*'s scope. Once reduction sentences or interpretative systems were allowed, V_T terms could refer to observables or to nonobservables. That is to say that the models of *TC* included both. A general problem was that the Löwenheim-Skolem theorem implied that the models of *TC* included both intended models and wildly unintended ones (see Model theory). Unintended models are the source of potential counterexamples. Blocking them more concerns eliminating artifacts of the syntactical approach than it does dealing with substantive content of the analysis. Positivistic syntactical analyses of theories,

confirmation and explanation persistently were plagued by problems of unintended models.

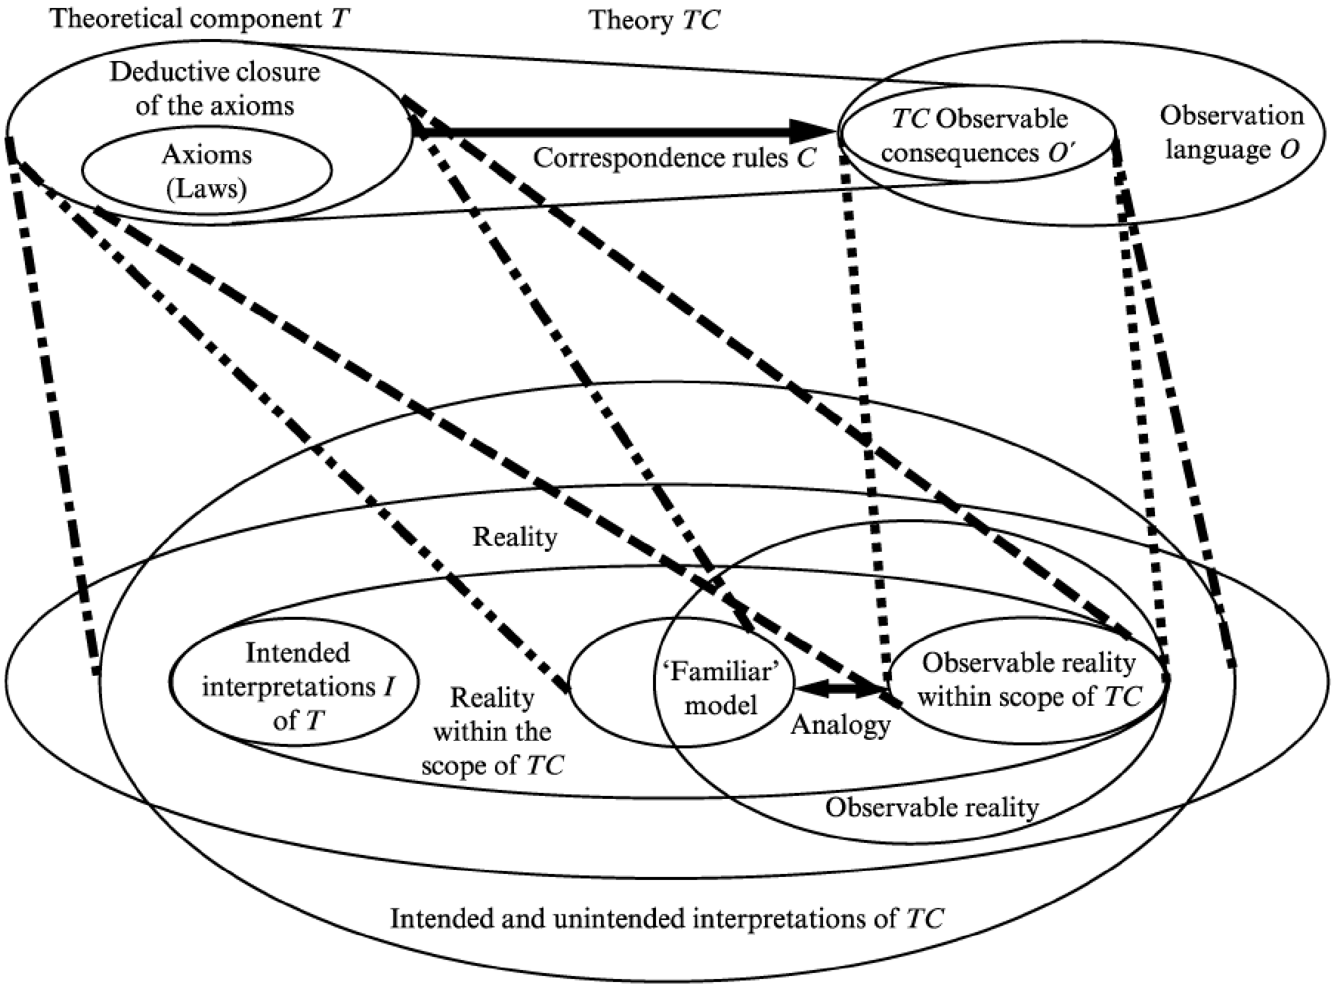

Figure 1. Semantic properties of the received view on theories under explicit and partial definition versions and when augmented by 'familiar' analogical models.

Key:consequences O' to pick out observable reality within the scope of *TC*.
TC and the interpretation of O' cause the theory component *T* to pick out observable consequences redundent of those O' pick out.
C are reduction sentences or interpretive systems that only partially define theoretical terms in *T*, the allowed interpretations of *T* include not only the intended interpretations of *T* but many wildly unintended and unrealistic interpretations as well. Further the choice of the correspondence rules *C* that partially define *T* is alleged by Campbell and Hesse to be highly irrational.
T must admit of a second interpretation in terms of a 'familiar' model that stands in an analogical relationship to the observable portion of reality within the intended scope of theory *TC*. This analogy rationally suggests plausible candidates for correspondence rules *C*, but does nothing to solve the problem of wildly unintended interpretations for *T*.

3 Instrumentalism versus realism

The arguments that prompted Carnap and C.G. Hempel to move from explicit definitions to reduction sentences or interpretive systems as preferred correspondence rules *C* are persuasive only within a realistic perspective. Those who resisted realism turned to instrumentalism to accommodate the undeniable benefits of theory not reducible to observation. Ramsey proposed that theoretical content be construed as a second-order existential quantification of theoretical laws which entailed the observable consequences of the theory. This, of course, only asserts that *some* system within the intended and unintended interpretations of Figure 1 yields observational consequences O' and thus does little to avoid realism, other than being noncommittal.

Craig's theorem asserts that whenever we bifurcate the nonlogical vocabulary of a theory *T* into V_T and V_O there is a new theory T_O using only the sub-vocabulary V_O that has precisely the T_O theorems. Thus theoretical assertions are alleged to be eliminable in science. Unfortunately T_O has an infinite axiom set whereas positivists construe theories as being finitely axiomatizable, and so this theorem's relevance is suspect. With the gradual liberalization of *C*-rules the received view became increasingly realistic. Nevertheless there is an artificiality to the realistic versus instrumentalistic debates since they erroneously assume that either all the terms in a theory are interpreted realistically or none are.

4 Demise of the received view

Logical positivists were concerned to accommodate real science and whenever they found incompatibilities with uncontroversial scientific achievement they modified their analyses accordingly. In practice this meant that they adjusted their analyses to accommodate the best physics had to offer, but deployed them normatively in evaluation of the social sciences. Positivists, especially Carnap and Hempel, were paragons of intellectual integrity, relentlessly subjecting their own analysis to scrutiny and revelling in the discovery of defects that required modifications.

Such internal critique did not challenge the presuppositions of their enterprise, but a series of external critiques in the 1950s and 1960s did. Most fundamental were the attacks on the observational-theoretical distinction by Achinstein and Hilary Putnam who charged that the distinction could not be drawn in a satisfactory manner. Later Suppe (1989) showed that these arguments established only that such a distinction could not be drawn on the basis of natural language usage and that, if artificially drawn, did not mark an epistemologically significant distinction. Achinstein and Putnam also charged that the notion of 'partial interpretation' associated with more liberal *C*-rules was incoherent; later Suppe (1989) gave a model-theoretic construal compatible with positivism, once it was realized that not all interpretation had to be via the observation language.

Putnam and Achinstein's attacks prevailed and were joined by new historically based accounts of theorizing that semi-explicitly rejected the received view. Hanson argued that observations were theory-laden - from which it followed that the observational-theoretical distinction was untenable. P.K. Feyerabend noted that observations and theories use the same descriptive vocabulary.

Thomas S. Kuhn's *Structure of Scientific Revolutions* is the classic reworking of positivism. He rejected the positivistic observational-theoretical distinction, instead embracing a version of N.R. Hanson's claim that observation is theory-laden. He denied that the connections between theory and phenomena can be mediated by any *explicit* set of correspondence rules. Instead exemplary applications are studied as one becomes a scientist and subsequent applications are modelled on these exemplars, and both phenomena and theory use the same vocabulary. His account of how, in revolutionary episodes, science switches 'paradigms' or organizing frameworks closely resembles Carnap's views on the arbitrariness of choosing a particular language or conceptual framework. In particular, both agree that the choice cannot be assessed on the basis of truth determination.

Schaffner (1969) charged that positivist *C*-rules conflated meaning relations, experimental procedures and causal relations. Thus they lumped together components that were epistemically distinct. Suppes (1962) argued that the *C*-rules account failed to reveal what was epistemologically central to the application of theories to phenomena. Suppe (1977) argued that the inclusion of *C*-rules as proper parts of theories resulted in improper individuation criteria for theories since the received view required that, contra actual scientific practice, a change in experimental procedure was a change in theory. The relevance of formalist approaches was challenged by Toulmin and others including, surprisingly, Hempel (in Suppe 1977).

Increasingly positivists had become sidetracked from the development of their substantive ideas by technical problems that were mere artifacts of their strategy of modelling science via predicate calculus axiomatizations. Suppes (1967) contrasted their 'intrinsic formulation' approach to the 'extrinsic' approach wherein one directly designates an intended family of models. Although formal semantics is incapable of designating precisely the intended set of models, our ordinary linguistic resources suffice. In practice we do pick out just intended models (else there would not be a problem of unintended models), and so we can proceed directly to the specification of these models without recourse to syntactic axiomatization. What is surprising about this line of criticism is that Carnap and others were seminal developers of formal semantics, yet that work had little impact on their approach

to formal analysis of theories which, to the end, was aggressively syntactical.

Under the weight of these objections the consensus emerged that the received view was fundamentally untenable.

5 The semantic conception

Questions such as whether Schrödinger's wave mechanics and Heisenberg's matrix mechanics are the same theory were resolved when von Neumann showed that they both admitted of the same canonical Hilbert space representations. That and a related paper construing theories as configurated state spaces mapped onto observation spaces inspired the development of the semantic conception. The basic idea is that a theory is identified by a suitably connected family of models.

Everet Beth used set-theoretic techniques to analyse several specific theories, speculated about the potential for semantic analyses, and pioneered the semantics of amplified usage wherein the same formalism can refer variously to different set-theoretic structures.

In the early 1950s Patrick Suppes, J.C.C. McKinsey and others investigated foundational issues in physics via set-theoretic axiomatizations. Generalizing from these studies Suppes argued that theories were extra-linguistic set-theoretic structures and offered a general structural analysis. One argument for this semantic approach was that extrinsic presentation of theories avoided the problem of blocking unintended interpretations that had so diverted positivism from its philosophical agenda. Suppes (1962) explored theory structures associated with phenomena in experimental circumstances (see Measurement, theory of). Drawing on his mathematical learning theory laboratory experience, he argued that the connection between theory and experiment is mediated via a hierarchy of models including the model of the experiment, models of data, experimental design, and *ceteris paribus* conditions.

Drawing on his jet-engine flight-test research experiences, Suppe (1989) argued that correspondence rule accounts bore little resemblance to how theories attached to phenomena or how theories were tested. Analysing theories as essentially describing state transitions in a 'state space', he argued that propounding a theory consisted in asserting a suitable mapping relation between the configurated state space and systems within the theory's scope. Because theories ignored all but a selected finite number of variables, the relation had to be counterfactual wherein the theory structure specified how systems within the theory's scope *would* behave *were* they isolated from influences not showing up as variables in the theory.

The counterfactual interpretation of theories has implications for how theories are confirmed by experiment. Characteristic of experimental design is control of extraneous variables so that only variables of the theory are influential. Suppe viewed the logic of confirmation as turning essentially on issues of experimental control, and offered a rigorous epistemology where the adequacy of theories under controlled circumstances licensed the generalized conclusion that the theory was counterfactually true of *all* systems within its scope. On Suppe's epistemology, observational knowledge of one carefully crafted experimental instance is sufficient to establish a scientific theory non-inductively.

Whereas Suppes and Suppe have concentrated on the experimental mediation of theory to experiment, van Fraassen's version of the semantic conception focuses on ontological issues. His investigations have focused on the semantic relations between theories, their formulations, and reality. His starting point is the supposition that not everything referred to in a theory engenders ontological commitment. The problem is to give full semantic interpretations of theoretical language without excessive ontological commitments. His solution is the theory of *semi-interpreted languages* wherein languages are interpreted as referring to 'logical spaces' which provide a full semantic interpretation for the language of theorizing. However ontological commitments are left unconstrained, being a matter of which points in the logical space one wishes to ontologically commit to. Such commitments are made via individual mapping functions (called *Loc* functions) from the real-world objects to points in logical space. For van Fraassen scientific theories are just suitably configurated logical spaces.

Figure 2 illustrates the main features of the semantic conception and relations between prominent versions. Detailed examinations of biological theory using the semantic conception have been made by Lloyd (1988) and Thompson (1989), and of quantum theory by van Fraassen (1991).

In contrasting semantic and syntactical approaches, some people refer to the latter as 'the statement view'. That is misleading since some philosophers view statements as linguistic entities having a syntax, and others do not. When

theories are characterized as collections of statements construed extra-linguistically, one is presenting a semantic analysis. Proponents of the semantic conception view such statements as structurally too problematic or impoverished to shed much illumination on the structure of theories.

6 Realism versus antirealism

Since theories are extra-linguistic entities, realism-instrumentalism disputes have to be recast. On the semantic conception theory, structures specify state-transitions where states are *n*-tuples of simultaneous values for the theory's variables or, in theories like quantum mechanics and natural selection, probability distributions over such values. Realism debates concern the nature of the mapping relationship between theory structure and the world (see Figure 2).

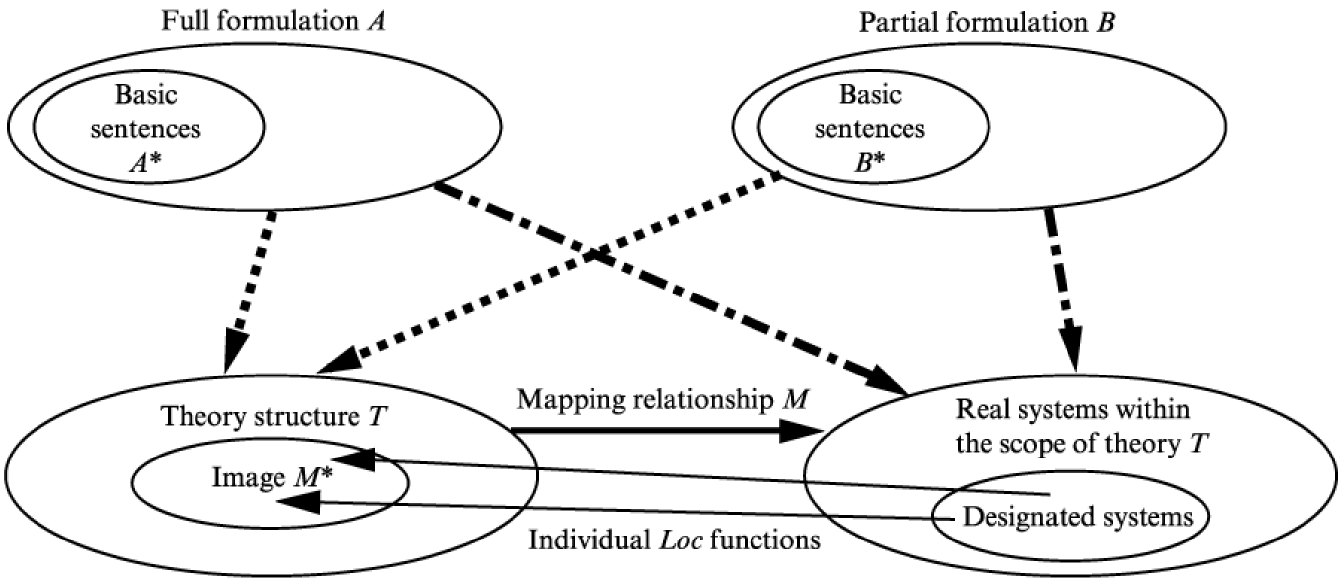

Figure 2. The semantic conceptions of theories.

Here theory structure *T* consists of precisely the intended interpretations of formation *A*. Note that no observational-theoretical interpretation of the theory formulation languages *A* or *B* are presupposed nor are there any correspondence rules as proper parts of the theory. Theory-structure *T* provides a full semantic interpretation the formulation languages *A* and *B* which are also interpreted real systems within *T*'s scope. Theories are asserted to stand in some mapping relationship *M* to real systems within the scope of the theory. On a realistic version, *M* would be a homomorphism; on Suppe's quasi-realistic version, *M* would be a counterfactual relationship specifying how the real systems would behave were they isolated from influence by variables not in *T*; on van Fraassen's constructive empiricism the mapping *M* is between a designated subset of the real systems and its image *M** under individual *Loc* functions. When *M** is contained in *T* then *T* is said to be empirically adequate. The *Loc* functions specify the ontological commitments one makes in asserting the theory *T*. On Suppes' version, the mapping relation *M* is mediated by a hierarchy of models including models of the experiment and models of data. Experimental design, instrumentation and so on, are not proper parts of theories but are used to determine whether mapping *M* does hold.

Realism maintains that theories give literally true accounts of reality. That means that one is ontologically commited to all the state variables. A theory is empirically true just in case the allowed state-transitions in the theory structure are identical to those which could occur in the actual world.

Van Fraassen's *antirealism* does not commit ontologically to all state variables. On his scheme a realist will have *Loc* functions onto every state variable, whereas he only countenances *Loc* functions from observables. Let *W* be that portion of reality to which one attaches *Loc* functions. Then according to van Fraassen a theory is *empirically adequate* precisely if the image *M** of *W* is among the models comprising the theory. Although van Fraassen resorts to an observational-nonobservational distinction to motivate his analysis, it works for any vocabulary bifurcation. The result is a general account of how language can have full semantic interpretations without generating ontological commitments to every semantically utilized entity. Van Fraassen is particularly concerned

about the fact that at various junctures science is irreducibly modal, yet it seems excessive to commit ontologically to unreal possible worlds. Semi-interpreted languages provide an escape from such ontological commitment. Within the range of ontological commitment empirical adequacy is equivalent to empirical truth. His antirealism thus is just realism attenuated to the range of one's ontological commitment.

Suppe questions whether any theories meet realistic truth or antirealistic empirical adequacy requirements since the scope of a theory includes systems influenced by variables not taken into account by the theory. Real world state-transitions often diverge from those specified in theory structures - thus making the theory false or empirically inadequate. In actual practice we only test theories against systems isolated under experimental control. Suppe's *quasi-realism* consists in ontological commitment to all variables that can be detected, together with the claim that empirically true theories provided counterfactual characterizations of how systems would behave were they isolated from influences not taken into explicit account by the theory. One could develop quasi-realisms with van Fraassen-like restricted ontological commitments.

Van Fraassen's semi-interpreted languages provide a general framework for evading excessive metaphysical commitment. (Thus, Suppe who is far more realistic, utilizes van Fraassen's semi-interpreted languages in his treatment of the relations between theory structure and linguistic formations, and in the analysis of empirical probabilities and causal modalities.) It accommodates, but does not require, commitment to van Fraassen's *antirealism*.

Although van Fraassen's enterprise is antimetaphysical in a manner not unlike Carnap's 'Empiricism, Semantics, and Ontology', neither he nor the other developers intend the semantic conception to demarcate the scientific from the unscientific or the real from the metaphysical. Indeed, semi-interpreted languages show that issues of ontological commitment are independent of the structure of theories, though not of one's epistemology.

7 Models and theories

For positivists theoretical terms have no empirical referents until they receive infused meaning from correspondence rules. How does one rationally choose reduction sentences or interpretive systems if theoretical terms have no independent meaning? N.R. Campbell argued that the choice was irrational unless there were some interpretation of the theory's axioms to guide you. He proposed that theoretical terms should be given an independent semantic interpretation in terms of concrete familiar models that are analogous to systems in the observable portion of the theory's scope (see Figure 1). Correspondence rules that mirror the analogy then would be tried. Later followers like Harré and Hesse argued that such models were what made theories explanatory.

To accommodate theories like quantum mechanics, which does not admit of concrete familiar models, they allowed that the mathematical formalisms (presumably the structures not the equations) themselves could be the models. The proposal did nothing to solve the problem of unintended interpretations of the theory. Little illumination as to the nature of models resulted beyond the notion that they were analogical and hence akin to metaphors.

Suppes noted that the word 'model' variously refers to metamathematical models (set-theoretic structures used to interpret axiom systems), scientific theories, and physical or scientific models. He argued that the latter two sorts can be analysed in terms of metamathematical models. The semantic conception does so for scientific theories.

Although the philosophical literature on scientific models has focused on familiar concrete models used heuristically or along Campbell's lines, models are often vehicles of scientific knowledge, not mere analogues or metaphors. Data typically are presented as a *model of the data* into which the raw data have been embedded and structurally enhanced. Typically the model is some sort of configurated hyperspace. *Simulation modelling* is increasingly an alternative source of experimental data. Simulation and other *dynamic models* are state-transition systems used to probe or model real-world systems. Thus both theories and models consist of configurated mathematical spaces or structures standing in mapping relations to other systems, and so the structure of various scientific models can be studied along the lines of the semantic conception. Fair progress analysing dynamic and simulation models has been made by Burks and Suppe. As other sorts of scientific models are studied and given semantic analyses, we should come to the point where systematic comparative investigations of the scientific models and scientific theories can be given.

8 Dynamics of theories

One reason for rejecting the positivists' analysis was that theories were improperly individuated since experimental procedures were incorporated into correspondence rules. The semantic conception also is inadequate if it cannot properly individuate theories.

Theories do undergo development. Lakatos construed this as a progression of static theories within a research programme. Others maintain that theories are dynamic entities that expand their scope and undergo development. Developing a dynamic account where partial or sub-models individuate theories is central to Sneed's *structuralist* analysis which began as an application of Suppes's set-theoretic techniques to the problem of theoretical terms. Sneed noticed that determination of mass and force function values when applying classical particle mechanics must invariably utilize classical particle mechanics itself and claimed this is the characteristic mark of theoretical functions or terms. Theoretical functions threaten to make the predictive testing of a theory viciously circular unless their contribution to the empirical content of a theory is restricted.

Sneed's solution is that the empirical content of a theory varies from application to application, and so the portion of the theory used in an application to calculate theory functions is not part of the empirical content of *that* application of the theory. Yet theories have a unified content that cannot be accounted for by a conjunction of statements. More precisely: a theory consists of a theory structure *T* and a set *I* of intended applications that are physical systems. Let M_p be the possible physical systems, and let M_{pp} be the partial possible systems obtained by function *r* that strips the M_p of their theoretical functions. The theory's empirical content is expressed by the statement that there exists a class of extensions *E* of the M_{pp} obtained via the addition of suitably constrained theoretical functions, such that these extensions *E* all are models in *T*. The analysis here is a set-theoretic modification of the Ramsey sentence (§3).

It follows that theories cannot be individuated on the basis of theory structure *T*. Sneed generalizes the notion of the empirical content of a theory to a set-theoretic analysis of the *core* $T_C = \langle M_p, M_{pp}, r, M, C \rangle$ of the theory structure *T*, where *M* is the law of the theory and *C* is a set of constraints. Although *I* is a part of the theory $\langle T, I \rangle$, individuation of the theory only depends on a core I' of paradigmatic intended applications. Theories are individuated on the basis of T_C and I'.

Sneed's analysis of the dynamics and individuation of theories is driven by his formulation of the problem of theoretical terms, which depends crucially on the supposition that the testing of a theory requires a prediction and an independent determination of whether the prediction is correct. If, as a growing number of philosophers and historians maintain, prediction is not central to testing or confirmation, Sneed's analysis is unlikely to be compelling. More generally, although set-theoretic apparatus makes this a semantic approach, its perspective is neo-positivistic, being wedded to a hypothetico-deductive view of testing, concern over distinguishing theoretical from nontheoretical terms and modified Ramsey sentences. In this respect it joins a number of other neo-positivistic efforts that attempt to exploit model-theoretic notions. Subsequent development of the structuralist programme has focused on applying Sneed's perspective to Kuhn's views on science and incommensurability controversies (see Incommensurability).

Despite such reservations over the structuralist programme, the idea of individuating dynamically evolving theories on the basis of a structural core or partial models is a promising one. DaCosta and French (1990) present an analysis of partial models that is not tied to neo-positivistic ideas, but they do not apply it to theory individuation issues. Another untried approach would be to analyse theory structures as adaptive systems capable of reorganizing. Before expending much effort here, better data on how developing theories are individuated should be obtained.

Theory and observation in social sciences

The concept of observation has received relatively little systematic attention in the social sciences, with the important exceptions of social psychology, social anthropology and some areas of sociological methodology such as 'participant observation'. In a broader sense, however, concern with the relation between theory and 'reality', 'data', 'empirical research' and so on, has been a pervasive theme in the philosophy of social science and in the methodological self-reflection of the individual social sciences.

The social sciences differ very substantially in the extent and character of their metatheoretical preoccupations. Some are still dominated by what sometimes used to be called the 'standard view' in Anglo-American philosophy of science derived from the Vienna Circle's logical empiricism and consolidated by Karl Popper in the middle decades of the twentieth century (see Positivism in the social sciences). In this conception, theories consist essentially of law-like statements verified or, in Popper's more refined version, falsified, in a fairly direct confrontation with 'the facts'.

Both elements of this relation came under fire from the 1960s onwards. The traditional view of theory was attacked from three directions. Philosophers of science such as Mary Hesse, Rom Harré, Norwood Russell Hanson and Michael Scriven questioned the deductivist model of scientific theory. Historians and sociologists of science, building on the pioneering work of Thomas Kuhn (1962), himself inspired by a much earlier monograph by the neurologist Ludvik Fleck (1935), noted that scientists were much more collectivistic and conservative in their theoretical affiliations than Popper's model suggested (see Sociology of knowledge; Kuhn, T.). And social scientists, beginning with historians and philosophers of history, pointed out that explanations by reference to general laws had little application in the social world (see Explanation in history and social science §§1-2).

At the 'factual' or observational end of the relation, a convergent set of criticisms stressed the theory-dependence of observation statements in science as a whole and the additional complexities of 'understanding' social phenomena. Peter Winch (1958) developed themes of Wittgenstein's later work in directions which paralleled the traditional concerns of 'continental' hermeneutic theory. Here 'theory' builds on, and generally remains close to, the informal or common-sense understanding of a society of the kind possessed by its more reflective members. A variety of approaches, often grouped under the heading of 'social constructionism' and inspired directly or indirectly by Berger and Luckmann (1966), pursue their claim that what we call social reality is essentially the product of our own conceptualization. 'Critical' hermeneutics, combining hermeneutics with the Frankfurt School's critical theory, emphasizes, however, that these understandings can be systematically distorted by unequal power relations and the ideologies which sustain them (see Critical theory).

All this occurred against the background of the increasing polarization of the social sciences in the late 1960s and early 1970s, a marked revival of interest in the classics of nineteenth- and early twentieth-century sociology and, to a lesser extent the other social sciences, and more broadly, what has been called 'the return of grand theory' in the human sciences (Skinner 1985). The diversity of old and new perspectives led to something of a free-for-all in the more theoretically reflective social sciences. It also suggested however that earlier conceptions of the relation between theory and observational data were perhaps more relevant and productive than those found in the standard view. In both their substantive theorizing and in their metatheoretical reflections, Marx, Weber, Durkheim and the other classics, seemed less like remote ancestors of a social scientific practice which had since become 'scientific', and more like senior contemporaries.

As a result, English-language social science re-established connections with more theoretical traditions in continental Europe, and also with the philosophy of science (see Social science, contemporary philosophy of §4). In particular, the realist philosophies of science which became influential in Britain and elsewhere in the 1970s were inspired largely by a rejection of positivistic social science (see Scientific realism and social science §§1-2). But whereas the interpretive or hermeneutic traditions and those of critical theory had focused mainly on the inappropriateness of positivism as a theory of social science, realists offered an explicit alternative to positivist and conventionalist theories of science as a whole, thus leaving the way open, as was noted by Russell Keat (1971), to a restatement of naturalism, the thesis that the natural and the social sciences were alike concerned with the identification of structures and explanatory mechanisms. Realists accept that observations are theory-laden but

reject conventionalist conclusions, asserting instead that science is an open-ended, developing and fallible attempt to capture in our descriptions, models and theories the underlying structures of social reality. With this view, theory-choice cannot simply be based on observational adequacy or predictive success, but on a more complex and contestable assessment of explanatory power, involving bolder conjectures about the stratification of nature than one finds in the standard view, even among those like Popper, who defended a version of realism.

Theory and practice

Questions concerning the relation of 'theory' to 'practice' include whether there is a role for theory in the practical realm of ethics and politics; if so, how it can guide or provide justificatory reasons for practice; how reference to ethical practices might enter into the justification of theory; and whether theory can play a role in the critical appraisal of social practice. In responding to these issues, different conceptions of theory and practice need to be distinguished. Justifiable scepticism about ambitious claims for ethical theory need not rule out a more modest role for theoretical reflection on practice.

1 Theory and practice

The concepts of both 'theory' and 'practice' are used in a variety of ways. The term 'theory' is sometimes a shorthand for 'ethical theory' (see Morality and ethics §1). Minimally it can refer to any systematic framework of general ethical principles. More elaborately it refers to those systematizations which specify some basic set of principles from which more detailed moral injunctions that guide practice can be derived or with reference to which they can be tested: Kantian and utilitarian theories provide standard examples (see Kantian ethics; Utilitarianism). Other properties are commonly attributed to 'ethical theory' in this style: that it specifies principles that are 'abstract', that it be justifiable from an impartial perspective, that it make a claim on any rational agent (see Impartiality; Universalism in ethics §2). In addition to this specific use, the concept of theory is also used more broadly to include social and political thought which has both explanatory and normative components: Marxian and Austrian economic theories are standard examples (see Economics, philosophy of §§1, 3). The concept of practice is similarly used in a variety of ways. It can refer to specific actions (such as the act of giving this drug to this patient); to a kind of act (the giving of drugs, for instance); to a group of systematically related activities pursued for some common end (such as the practice of medicine); or, more broadly still, to a set of social institutions (for example, political and economic arrangements with different distributions of rights and goods). Finally, the concept of 'moral practices' is often used in contrast to 'ethical theory' to refer to the embodiment of ethical life in the specific responses and institutions of particular communities.

2 Principle and action

How are ethical principles which appear as general statements in a theory to specify or guide particular courses of action? One possible answer, the algorithmic, is that knowledge of the principle determines all the cases that fall under it. The principle specifies a finite list of properties that can be mechanically ascertained, so that for any situation it specifies unequivocally the act to be performed. Denials of this algorithmic approach standardly invoke the need for judgment (see Universalism in ethics §3). Rules cannot specify in advance the conditions under which they apply for they require an act of judgment about particulars which cannot be itself rule-determined. This role of judgment can be understood in a strong or weak sense. In the weak sense it is confined to seeing that a particular case falls under the rule. The principle is not itself infected by the judgment. On the strong position, the act of judgment, ascertaining whether an act falls under the rule, is akin to an act of interpretation which infects our understanding of the principle itself. The application extends our understanding of the principle. Defences of such positions often invoke Wittgensteinian considerations about rule-following: every application is a new interpretation (see Wittgenstein, L. §10). Consider, for example, the question of whether an act of 'date rape' should come under the principle prohibiting rape. On the algorithmic position, there should be general rules which will determine for us whether the act falls under the principle. On the weak judgmental position, a concept of rape is given and judgment is applied to ascertain whether this particular case falls under it. On the strong position, what the case does is to raise the question of how we are to understand the general principle against rape: the concept of rape itself is extended by this (and every other) new case.

The positions outlined put increasing emphasis on the importance of 'particular' as against 'universal' principles in ethical deliberation. This emphasis on the particular often takes the form of general scepticism about the very idea of ethical theory as a set of general principles that guide practice. The strong particularist rejects the whole picture of moral theory as a set of systematic general principles from which particular moral injunctions can be derived (see Moral particularism). Ethics is not codifiable. It is a matter of having the virtues, those dispositions of character that enable one to see and respond to a situation in a certain way, which cannot be settled in advance by

the application of principles (McDowell 1979) (see Virtue ethics; Virtues and vices §3). Within the conservative tradition of politics the idea of ethical theory is taken to be a rationalist misunderstanding of the nature of moral knowledge: a theoretical approach involves a confusion of technical knowledge, which can be articulated in a set of rules and reflected upon, with practical knowledge, which is unreflective, exists only in use, and cannot be formulated in rules (Oakeshott 1962) (see Conservatism §5). Scepticism about theory as a guide to practice is often allied with scepticism about the possibility of ethical theories providing justificatory reasons for a practice. There is no perspective external to ethical practices from which justification is possible. Only from within an ethical practice do we know how to go on. Correspondingly, appeals to principles of reason such as consistency or to formal features of moral language are too thin to justify any system of ethical belief (see Moral scepticism §2).

This sceptical approach to moral and political theory may have force against a particular ambitious model of theory according to which we can have a moral theory that takes a standpoint entirely external to any particular moral practice, makes a claim on any rational agent irrespective of time and place, and offers a decision procedure for settling any practical problem by the mechanical application of a system of universal principles. Criticism of ambitious theory can be granted. However, the sceptical arguments do not rule out theory in a more modest sense of systematic reflection on our ethical beliefs, attitudes and practices, nor do they show that such reflection cannot give us reasons to change and even abandon some existing practices. An antitheoretical position that rules out even modest ethical theory renders both particular acts and social practices opaque to criticism and public judgment. Reflective equilibrium in the Rawlsian sense in which theory starts from considered ethical judgments in everyday practices, subsequently revising some in the attempt to render judgments coherent, does not require us to reason from a point of view external to our practices (Rawls 1971). Neither do the forms of radical critical social theory developed within the Marxian tradition.

3 Social theory and political practice

Critical social theory within the Marxian tradition especially as systematized in the Frankfurt School (Fay 1985) proceeds through immanent critique of social practices from the inside through theoretical reflection (see Frankfurt school; Critical theory). The account runs roughly as follows. Social practices, in the widest sense of the term, are constituted and sustained by particular pre-theoretical self-understandings and norms. For example, market contract is constituted by self-understandings of the participants as independent agents with property rights which are exchanged according to certain norms; and it is sustained by the assumption that these norms are legitimate (see Ideology). Theoretical reflection on social practices will in part involve making explicit these assumptions. At the same time it may make assertions that conflict with the self-understandings of actors by claiming that they are either false or incoherent. Typical is Marx's claim that the market contract between wage worker and the owner of capital is not the free exchange between independent agents that the actors within it conceive it to be (see Marx, K. §9). The conflicts between the self-understandings of actors and the claims of social theory form the core of critical social theory, which takes as its aim the liberation of agents from those self-understandings through the changing of those practices that depend on them (Marx 1843). Within the early philosophical work of Marx this is conjoined with the more radical claim that, since many theoretical errors are the articulation of the false understandings that constitute or sustain particular practices, overcoming the theoretical errors requires changes to those practices (Marx 1845).

The extent to which critical theory can provide a purely internal criticism of any social practice is open to doubt. It presupposes contested Enlightenment norms of consistency and transparency of self-understanding. Moreover, those norms of themselves may be too thin to sustain a critique of social practices without the support of others. Hence a more general reflection on the goods of human life may be a presupposition of critical theory.

Theory of types

The theory of types was first described by Bertrand Russell in 1908. He was seeking a logical theory that could serve as a framework for mathematics, and, in particular, a theory that would avoid the so-called ‘vicious-circle’ antinomies, such as his own paradox of the property of those properties that are not properties of themselves - or, similarly, of the class of those classes that are not members of themselves. Such paradoxes can be thought of as resulting when logical distinctions are not made between different types of entities, and, in particular, between different types of properties and relations that might be predicated of entities, such as the distinction between concrete objects and their properties, and the properties of those properties, and so on. In ‘ramified’ type theory, the hierarchy of properties and relations is, as it were, two-dimensional, where properties and relations are distinguished first by their order, and then by their level within each order. In ‘simple’ type theory properties and relations are distinguished only by their orders.

1 Ramified type theory

The theory of (ramified) types was first described by Bertrand Russell (1908) as a way of avoiding vicious-circle antinomies, including the one discovered by Russell himself regarding the property that applies to all and only those properties that do not apply to themselves (see Russell, B.A.W. §§7-8; Paradoxes of set and property §5). A property is said to be ‘impredicable’ if, and only if, it is not predicable of itself; thus, the property of being impredicable is impredicable if, and only if, it is not impredicable.

$$\mathrm{Impred}(\mathrm{Impred}) \equiv \neg\mathrm{Impred}(\mathrm{Impred})$$

From this the contradiction follows that the property of being impredicable both is and is not impredicable. The theory of ramified types for propositional functions was developed in *Principia Mathematica* (1910-13). For Russell, such a theory was the framework of a ‘logically perfect language’, by which he meant a language that would show at a glance the logical structure of the facts that can be described by means of it, and in particular a language ‘in which everything that we might wish to say in the way of propositions that are intelligible to us, could be said, and in which, further, structure would always be made explicit’ (1959: 165). All that would be needed to add to such a theory is a vocabulary of descriptive constants that correspond to the meaningful words and phrases of the natural sciences or of natural language. The basic laws of a natural science would then be listed as nonlogical postulates of that science, and (as later proposed by Rudolf Carnap) the analytic connections between the words and phrases of natural language would be listed as meaning postulates. The constants and postulates of pure mathematics do not also need to be added, according to Russell, because they are all definable and provable in purely logical terms within the framework of type theory itself - a view known as (Russell’s form of) logicism (see Logicism §1).

The way type theory avoids vicious-circle antinomies is by imposing logico-grammatical constraints on the logic of predicates. The basic idea is that predicates (and the propositional functions they stand for) are to be typed in a hierarchical manner so that predicates of a given type (and their corresponding propositional functions) could never meaningfully be applied to predicates (propositional functions) of the same or higher type. (Thus both $\mathrm{Impred}(\mathrm{Impred})$ and $\neg\mathrm{Impred}(\mathrm{Impred})$ are meaningless in type theory.) In ‘ramified’ type theory, the hierarchy is, as it were, two-dimensional, having a ‘vertical’ dimension consisting of a hierarchy of orders and, within each order, a ‘horizontal’ dimension consisting of a hierarchy of levels. That is, properties are distinguished in ramified type theory as being both of a given order (for example, first-order, second-order and so on) and of a specific level within that order. Thus, for example, where ‘being shrewd’, ‘being courageous’, ‘being insightful about enemy positions’ and so on are examples of first-order/first-level properties that Napoleon and other great generals shared (that is, properties of r-type (i)/1, as defined below, assuming Napoleon and other generals to be of r-type i), Napoleon’s having *all of the (first-order/first-level) properties of a great general* - that is, all of the (first-order/first-level) properties that make up what it is to be a great general - amounts to Napoleon having a first-order property of level two (that is, a property of r-type (i)/2, as defined below). ‘Simple’ type theory has only the ‘vertical’ hierarchy.

The description of the ramified hierarchy given by Russell was informal and relied on a use/mention confusion (see Use/mention distinction and quotation §3) between propositional functions (properties or relations) and the

open formulas with 'apparent' (that is, 'bound' as opposed to 'free') variables taken to represent those functions. The ramified theory was not given a precise, formal description until Alonzo Church's paper of 1976, which, in accordance with contemporary terminology, uses the notion of 'order' to represent the 'vertical' hierarchy (instead of Russell's informal notion of order corresponding to the 'horizontal' hierarchy), and which uses the notion of 'level' to represent the 'horizontal' hierarchy. Church's definition of ramified types ('r-types') is as follows:

(1) There is an r-type *i* to which all and only individuals belong, and whose order is stipulated to be 0.
(2) If *m* is a non-negative integer and *n* is a positive integer and $\beta_1, \ldots, \beta_m$ are any given r-types, then there is an r-type $(\beta_1, \ldots, \beta_m)/n$ to which belong all and only *m*-ary propositional functions of level *n* and with arguments of r-types $\leq \beta_1, \ldots, \beta_m$, respectively; and the order of such a function is $N + n$, where *N* is the greatest of the orders corresponding to the types $\beta_1, \ldots, \beta_m$ (and $N = 0$ if $m = 0$).

Here, by an 'individual', that is, an entity of r-type *i*, Russell meant a concrete object (in particular, an event) as compared to the propositional functions (abstract properties and relations) that make up the entities of all other r-types. (It is not essential for all logical purposes that the entities of the basic type *i* be concrete, however.) The notion of the level of a propositional function ϕ of r-type $(\beta_1, \ldots, \beta_m)/n$ represents what Russell intended in speaking informally of the 'apparent' (bound) variables occurring in ϕ. If *N*, for example, is the greatest of the orders of $\beta_1, \ldots, \beta_m$, and *k* is the greatest of the orders of the 'apparent' variables occurring in ϕ (construed as a formula of r-type $(\beta_1, \ldots, \beta_m)/n$), then $n = 1$ if $k \leq N$, and $n = k + 1$ if $N < k$. According to Russell, a propositional function (or formula for such) was said to be 'predicative' if 'it is of the lowest order compatible with its having the arguments it has' (1910-13: vol. 1, 53); that is, in terms of the notion of level, ϕ is predicative if, and only if, $n = 1$.

In the simple theory of types the distinction between levels is dropped and only the distinction between orders is retained, so that in effect all propositional functions of the simple theory are predicative - although the comprehension principle of simple type theory, unlike that of ramified type theory, allows that such functions can be specified 'impredicatively', that is, in terms of a totality to which they belong.

2 The axiom of reducibility

It was Russell's view that all of traditional mathematics about numbers as abstract objects could be represented in terms of the predicative propositional functions of his theory of ramified types. He could not justify such a view, however, without assuming an 'axiom (schema) of reducibility', which stipulates that every propositional function of whatever r-type is coextensive with a predicative propositional function (having arguments of the same r-type). In symbols:

$$(\forall\phi)(\exists\psi)(x_1)\ldots(x_m)[\phi(x_1, \ldots, x_m) \\ \equiv \psi!(x_1, \ldots, x_m)],$$

where 'ϕ' and 'ψ' are variables for propositional functions of r-types $(\beta_1, \ldots, \beta_m)/n$ and $(\beta_1, \ldots, \beta_m)/1$, respectively, and '$x_1$', …, '$x_m$' are variables of r-type $\beta_1, \ldots, \beta_m$, respectively. (Russell used '$\psi!$' to indicate that the propositional function represented by 'ψ' is predicative.) This axiom was criticized by a number of logicians (including L. Chwistek 1922; F. Ramsey 1931; W.V. Quine 1936) who argued that, on the assumption that type theory is an extensional system in which propositional functions of the same r-type are identical if they are coextensive (that is, true of all the same objects), the effect of the axiom of reducibility was to nullify the distinction between the different levels of propositional functions - in which case ramified type theory amounted to nothing more than a notationally complex version of simple type theory.

The extensionality assumption is dubious, however, if propositional functions are interpreted intensionally as properties and relations (as Russell originally intended). The point of the axiom of reducibility was not to identify properties and relations with their extensions, but to represent their extensions within the wider intensional framework, which is why Russell also called it 'the axiom of classes' (1910-13: vol. 1, 167). The effect of the axiom is that so-called 'impredicative' specifications of propositional functions - that is, specifications of functions in terms of a totality to which they belong - are 'annulled in extensional but not in intensional matters' (Church 1976: 758).

Ramsey emphasized a distinction between so-called logical and semantic antinomies, both of which the theory of

ramified types was designed to avoid. Russell's paradox, for example, is one of the logical antinomies, as is Georg Cantor's paradox that there are classes (such as the universal class) larger than all other classes, even though, by a theorem of Cantor's, there is a class larger than any given class. These are paradoxes that, without some restrictions such as those imposed in a theory of types, simple or ramified, might occur in any system rich enough to represent properties as objects having properties, or classes as members of classes. The semantic antinomies, on the other hand, assume special semantic notions, such as truth (as in the liar paradox of a sentence that says of itself that it is false, which if true is false, and if false is true), or definability (as in G.G. Berry's paradox of 'the least integer not nameable in fewer than nineteen syllables', which is itself a name with just eighteen syllables), and other related notions of semantics. Ramsey (1931) thought of the semantic paradoxes as 'epistemological' in nature. (See Paradoxes of set and property.)

3 The simple v. the ramified theory of types

The simple theory of types suffices to avoid the logical paradoxes, but not the semantic ones, unless a distinction is made (as first proposed by A. Tarski) between the object language of simple type theory and a metalanguage in which the different semantic notions for the expressions of simple type theory can be defined or developed axiomatically (see Tarski's definition of truth). The ramified theory of types avoids the semantic paradoxes by incorporating an additional hierarchy of levels that (combined with the hierarchy of orders) implicitly contains a hierarchy of languages, and that in effect amounts to a special form of the metalanguage/object language distinction by which the semantic (and related intensional) paradoxes can be avoided (as noted by Church 1976: §4). Adding the axiom of reducibility does not nullify the way ramified type theory resolves or avoids the semantic (and related intensional) paradoxes. (See Church (1976: §5) and Myhill (1979) for justification of this claim.)

Different versions of the simple theory of types have been formulated by L. Chwistek (1922), F. Ramsey (1931), R. Carnap (1929), K. Gödel (1931), and A. Church (1940). The simple theory is not committed to an extensional logic, although it is often formulated as such. R.M. Montague (1974), for example, extended Church's simple theory of types by incorporating into it operators for representing the intensions and extensions of expressions, and then used the resulting system as an intensional logic by which to provide an interpretation of a variety of intensional contexts of natural language (along lines originally described by Frege). Church (1974) has also formulated an intensional version of the simple theory by adding to it a formula operator for the Russellian notion of propositional identity. But in 1984, Church also showed that, given Russell's notion of a proposition, and hence of propositional identity, Russell's antinomy of propositions (Russell 1903: §500) can be reconstructed in simple type theory, but not in ramified type theory. According to this antinomy, there cannot be more classes of propositions than there are propositions - because every non-empty class of propositions can be associated with its 'logical product', which, by Russell's notion of propositional identity, is unique for that class; and yet, by Cantor's theorem, there must be more classes of propositions than there are propositions (see Cantor's theorem).

Theosophy

Etymologically, 'theosophy' means wisdom concerning God or divine things, from the Greek 'theos' (God) and 'sophia' (wisdom). Seventeenth-century philosophers and speculative mystics used 'theosophy' to refer to a knowledge of nature based on mystical, symbolical or intuitive knowledge of the divine nature and its manifestations. It referred also to an analogical knowledge of God's nature obtained by deciphering correspondences between the macrocosm and God.

In the late nineteenth century, 'theosophy' became associated with the doctrines of Helena Petrovna Blavatsky, the founder of the popular Theosophical Society. She drew on Buddhist and Hindu philosophy and fragments from the Western esoteric tradition, especially Neoplatonism. She espoused an absolutist metaphysics in which there is a single, ultimate, eternal principle which remains unchanged and undiminished, despite manifesting itself partially in the periodic emanation and reabsorption of universes. Her cosmology included a spiritual account of the evolution of material bodies, which serve as the necessary vehicles by which individuals gradually perfect themselves through cyclic rebirth.

1 Traditional theosophy and Western esotericism

Prior to the influence of the Theosophical Society, the term 'theosophy' was used to refer to any intellectual system of pagan, Jewish or Christian origin which purported to describe the secret constitution of the divine nature. Typically, this wisdom or 'gnosis' was used to achieve an understanding of the mystical relationships among the universe, humanity and God unavailable to either the empirical sciences or rational theology. Western theosophists saw themselves as heirs to a tradition of mystical and occult knowledge with roots in Pythagoreanism, Platonism, Neoplatonism, Gnosticism, Hermetism, the Jewish Kabbalah, medieval Christian mysticism and Renaissance nature philosophy.

According to Antoine Faivre (1994), the term 'theosophy' was used occasionally as a synonym for 'theology' even by some medieval philosophers, for example by Pseudo-Dionysius and Johannes Scottus Eriugena. It was used more frequently during the Renaissance, but acquired its distinctive meaning only at the beginning of the seventeenth century. At that time, alchemy, Alexandrian Hermetism and Jewish mysticism (the Kabbalah) were influencing the philosophy of nature and Rosicrucianism was gaining adherents. The latter was a loosely knit movement associated with members of the fraternal Society of the Rose Cross. Rosicrucians followed the teachings of the legendary Christian Rosencreutz, who preached the possibility of an initiatory knowledge of a supersensible reality. In this context, some German authors began to use 'theosophy' to describe the knowledge of God's nature obtained by esoteric and mystical interpretation of sacred texts. Jakob Boehme, for example, the German speculative mystic, described himself as a theosophist.

During the seventeenth century, 'theosophy' was closely associated with 'pansophy', a term used by Rosicrucians and Paracelsians to refer to a knowledge of divine things obtained by deciphering the 'signatures' found in the 'book of nature' (see Paracelsus §2). For seventeenth-century theosophy, the wisdom concerning the divine nature was understood first and a gnostic comprehension of nature was derived from it, whereas for pansophy the order was reversed - decoding the 'signatures' came first and God was known by understanding the correspondences between nature and God. But from the eighteenth century onward, 'theosophy' was used to refer to hermeneutic speculations in either direction.

'Theosophy' entered the world of academic discourse largely through Jakob Brucker's chapter on theosophy in his *Historia critica philosophiae (Critical History of Philosophy)* (1741), a work which became a standard reference for the history of philosophy in the eighteenth century. According to Faivre (1994), Denis Diderot's *Encyclopédie* article on theosophers used long passages from Brucker's chapter without citation. Diderot's article introduced 'théosophie' into the French language and served as the definitive exposition of the term during the Enlightenment.

Christian theosophy was unified more by its hermeneutical method and its goal of achieving a transformative experience of divine revelation than by the specific claims made by various theosophists about nature and God's nature. Christian theosophists interpreted divine revelation by symbolically re-experiencing the events described in

a sacred narrative. They relied on their imaginative responses to the text, confident that the imagination could be used as an organ of perception when divinely inspired and interiorly illuminated. Analogical principles that related the created world to God provided both an intellectual framework for, and a corrective to, the enthusiastic imagination. For example, Christian theosophists used this hermeneutical method to explain the existence of evil and the alienated spiritual condition of humanity in terms of the constitution of the Godhead.

Important figures in the Christian theosophical tradition are Meister Eckhart, Nicholas of Cusa (§2), Agrippa von Nettesheim (§§1-2, 5), Robert Fludd, Angelus Silesius, Johann Georg Gichtel, Emanuel Swedenborg, Friedrich Christoph Oetinger, Louis-Claude de Saint-Martin, F.W.J. von Schelling (§3) (especially in his later work - for example, his *Of Human Freedom*) and Franz von Baader.

In the late nineteenth century, the Theosophical Society introduced the term 'theosophy' into popular culture and widened its scope by including the theosophical doctrines of Oriental religion and philosophy.

2 Theosophy and the Theosophical Society

Helena Petrovna Blavatsky (1831-91) and the American journalist and lawyer Henry Steel Olcott founded the Theosophical Society in 1875 in New York City. Its mission was defined by three objects: first, to form a nucleus of the universal brotherhood of humanity, without distinction of race, creed, sex, caste or colour; second, to encourage the study of comparative religion, philosophy and science; and third, to investigate unexplained laws of nature and the powers latent in human beings. Blavatsky and Olcott moved to India in 1879, and in 1882 they established the Theosophical Society's headquarters at Adyar. In 1896, the American branch broke away, establishing the Theosophical Society of America.

Blavatsky's message appealed to nineteenth-century Americans because it harmonized science and religious faith, and delineated a worldview in which salvation was largely up to the individual. The publication of Darwin's *The Origin of Species* in 1859 contributed to a growing awareness that the findings of science were undermining belief in biblical texts as divine revelation. The apparent conflict between science and religion prompted some believers to look for a scientific basis for religious faith. The American ideal of self-improvement led some to question the moral acceptability of the Christian doctrines of vicarious atonement and eternal damnation. Blavatsky responded to these concerns by spiritualizing evolutionary theory and emphasizing self-reliance in the quest for moral and spiritual perfection. The Theosophical Society's influence was not confined to America, however: the Eastern ideas it popularized inspired many European artists at the beginning of the twentieth century, and its members were even influential in the revival of Buddhism in Ceylon (now Sri Lanka).

Blavatsky's theosophy has several distinctive features, some in common with the traditional theosophy of Western esotericism, and others in common with Oriental esotericism:

(1) It has an absolutist metaphysics which tends towards monism and idealism. There is an unknowable, impersonal, eternal, unitary First Principle which is the transcendent ground and source of everything (see Brahman). The doctrine is monistic because the absolute is the only self-sufficient substance, and ultimately all individual minds are substances in virtue of being rooted in the absolute. They are one with the absolute and with each other. The doctrine is idealistic because intelligence and consciousness are the primary manifestations of the absolute, although these attributes cannot properly be affirmed of it, according to theosophy's negative theology.
(2) Theosophy has an emanationist cosmology: the absolute's perfection remains undiminished and unchanged, though it manifests periodically as a lesser reality, the Logos or the manifest God, from whom numberless universes gradually emanate and dissolve in a rhythmic process (see Creation and conservation, religious doctrine of §3). The absolute does not create the universe; both creation from nothing and from a pre-existing matter are ruled out. Rather, the Logos periodically differentiates itself from the absolute as an expression of the absolute's inner nature.
(3) Theosophy has a hierarchical account of reality: there are seven degrees of being which manifest different aspects of the Logos, and for each 'plane' of being there is a grade of matter appropriate for manifesting intelligence and consciousness at that level. Ultimately, however, both matter and intelligence are manifestations of the Logos, which in turn is a manifestation of the First Principle.
(4) Theosophy espouses a teleological and idealistic evolutionary theory. It is idealistic because it claims that the evolution of diversified physical forms is preceded by an involution of consciousness into matter. General

species-specific characteristics first exist in the Logos, and through the process of physical evolution become more fully expressed by the functioning and capacities of biological organisms. In contrast, materialistic Darwinian theory claims that these characteristics are the result of entirely natural processes, that is, random genetic mutation and natural selection. Theosophical evolutionary theory is teleological because the evolutionary process aims at developing enlightened individuals who are conscious of the full range of their multidimensional existence and are dedicated to the project of leading others to spiritual truth. All individuals, from solar systems to human beings, gradually descend from the highest degree of being to the lowest and then ascend again. Human beings have a sevenfold constitution which reflects the seven degrees of being, and each principle of the human microcosm enables the individual to participate in the corresponding macrocosmic principle.

(5) The evolutionary process requires that human beings actualize and balance their gnostic, affective and volitional capacities. These capacities include direct insight into the transcendent reality, imaginative and mythic grasp of truths about the correspondences between the macrocosm and microcosm, unbiased reasoning which corrects intuition and unmasks self-deception, and compassionate concern for all living things. The awakening of compassion leads to a forceful commitment to the project of reshaping one's character and overcoming all obstacles to enlightenment, first in oneself and then in others.

(6) Theosophy claims that the universe works in accordance with ethical principles which guarantee that morality coincides with self-interest; in the long term, justice prevails. The 'law of karma' holds individuals accountable for their thoughts and intentional actions via a natural causal process. Both justice and evolutionary teleology require a long series of rebirths, in which individuals slowly perfect themselves by experiencing the painful consequences of their ignorance and misguided actions (see Reincarnation).

(7) The apparent conflict between the teachings of the various historical religions can be harmonized by understanding their esoteric and mystical core. In some cases, development or correction must be supplied from the unadulterated primeval tradition, allegedly preserved by a secret brotherhood of adepts and sages.

(8) There is an 'occult science' comprised of natural laws unknown to modern science.

Thermodynamics

Thermodynamics began as the science that elucidated the law-like order present in the behaviour of heat and in its transformations to and from mechanical work. It became of interest to philosophers of science when the nature of heat was discovered to be that of the hidden energy of motion of the microscopic constituents of matter.

Attempts at accounting for the phenomenological laws of heat that make up thermodynamics on the basis of the so-called kinetic theory of heat gave rise to the first fundamental introduction into physics of probabilistic concepts and of probabilistic explanation. This led to so-called statistical mechanics.

Some of the issues of thermodynamics with importance to philosophers are: the meaning of the probabilistic claims made in statistical mechanics; the nature of the probabilistic explanations it proffers for the observed macroscopic phenomena; the structure of the alleged reduction of thermodynamic theory to the theory of the dynamics of the underlying microscopic constituents of matter; the place of cosmological posits in explaining the behaviour of local systems; and the alleged reducibility of our very notion of the asymmetry of time to thermodynamic asymmetries of systems in time.

1 Historical sketch

One of the great discoveries of phenomenological thermodynamics was the joint conservation of the totality of overt mechanical energy and internal heat, a law confirmed by Joule and called the first law of thermodynamics. Another was the realization that the ability to transform the internal heat of a system into usable mechanical work required a process in which heat was introduced into the system at a higher temperature and recovered at the end of the process only at a lower temperature where it was less available for conversion into work. These insights began with the investigations of Carnot, and were brought to fruition by Clausius with his introduction of the concept of entropy and the postulation of the second law of thermodynamics.

The idea that heat was merely energy of motion of microscopic constituents of matter was already suggested by Francis Bacon and Bernoulli. These ideas were resurrected by Herepath and Waterston, but ignored by the scientific community. Finally, when once more discovered by Krönig and developed by Clausius, this theory became the dominant theory of heat.

The full-blown kinetic theory receives its greatest impetus from Maxwell's ingenious derivation of the distribution of velocities of the molecules of a system which has obtained equilibrium, and from the derivation of a law governing the path followed by a system from an initial non-equilibrium condition to equilibrium by J.C. Maxwell and by Boltzmann. Boltzmann also provided a proof that any system not in equilibrium must move to equilibrium and then stay there, providing an underpinning at the kinetic level for the behaviour demanded by the second law.

The kinetic theory of heat was criticized by such positivistically minded philosophers as Duhem and Mach for its introduction of unobservables and its insistence on mechanistic explanations (see Duhem, P.M.M. §2; Mach, E.). More important were the specific objections made to the theory of approach to equilibrium. The kinetic theory predicts inevitable approach to equilibrium in the future time direction. But the underlying dynamics of the molecules is time-reversal invariant. Furthermore, the dynamical theory predicts the 'almost recurrence' to its initial state by the system, a recurrence that is incompatible with a monotonic approach to stationary equilibrium.

In response to these observations Maxwell and Boltzmann introduced probabilistic considerations into the theory. Boltzmann characterized equilibrium as the 'most probable' state of a system. He also argued that his equation gave the probable evolution of a system, not its inevitable evolution. Even this interpretation of Boltzmann's equation is subject to objections, and Boltzmann finally moved to a time-symmetric interpretation of his theory: almost all the time systems are at equilibrium. Occasionally they fluctuate from it. When a system is in non-equilibrium it is usually closer to equilibrium in both future and past time, as described by Boltzmann's equation.

But why, then, do we live in a non-equilibrium world? Boltzmann suggested that our region of the universe is a local fluctuation from equilibrium, the universe as a whole being at that most probable state. The consistency of the Boltzmann account was elucidated in an important survey piece by Ehrenfest and Ehrenfest (1959).

2 Equilibrium theory

A standard method for calculating the values of quantities at equilibrium was invented by Maxwell and Boltzmann, and generalized by Gibbs. A probability distribution is placed over the set of microscopic conditions of the system compatible with its macroscopic constraints (such as its fixed total energy and confinement to a box of specific volume). Macroscopic quantities at equilibrium are then identified with averages, calculated using the probability distribution, of the values of functions of the possible microscopic conditions.

But what justifies choosing a specific probability distribution? And with what physical proportion or frequency in the world is it to be associated?

One proposal (by Jaynes (1983)) takes it that the distribution is justified by standard principles of inductive reasoning and that the probability in question is to receive a subjective interpretation. More common is the proposal, suggested by Maxwell and Boltzmann, that the probabilities in question are representative of proportions of time, in the limit as time goes to infinity, in which a single system has microscopic conditions of a given kind (see Probability, interpretation of §§3, 5).

The attempt to justify this latter claim led Maxwell and Boltzmann to the ergodic hypothesis, the posit that over infinite time a system's microscopic condition would take on every possible value. This posit leads one to the conclusion that the standard probability distribution is the unique such distribution stationary in time, and that its probabilities do indeed correspond to time proportions in the infinite time limit. But the hypothesis is provably false.

The ergodic hypothesis was later replaced by the ergodic theorem, a theorem that holds for specifiable dynamical systems and from which weakened versions of the consequences of the hypothesis can be derived. The central question for the philosopher is the degree to which the results of ergodic theory provide statistical explanations of the equilibrium nature of systems. Two crucial problems are the facts that the results require idealizations concerning systems often not met by realistic systems (see Idealizations), and that the results connect probabilities with proportions only in an infinite time limit.

3 Non-equilibrium theory

Equilibrium theory cannot explain approach to equilibrium observed experimentally in the world. For this, one needs a statistical mechanical derivation of the appropriate 'kinetic equation', the equation generalizing that found by Boltzmann for gases of low density.

The standard derivations of the kinetic equations invoke re-randomizing posits, the descendants of Boltzmann's hypothesis with regard to collision numbers and of the hypothesis of molecular chaos of the Ehrenfests. The problem is, however, that once an initial probability distribution is specified for a system, its dynamic evolution is fixed by the underlying deterministic dynamical laws governing the micro-constituents. Therefore the consistency of a re-randomization posit is always in doubt. Much of orthodox non-equilibrium theory consists in getting rid of such dubious posits.

Two important approaches to non-equilibrium theory are those of 'mixing' and of the 'rigorous derivation of the Boltzmann equation'. The former approach generalizes the results of the ergodic theorem to rationalize a model presented by Gibbs. In this approach one tries to show that for appropriately idealized systems, at least in the infinite time limit, any initial probability distribution assigned to a system and associated with its initial non-equilibrium condition will approach the probability distribution associated with equilibrium for the system in a 'coarse-grained' sense. One uses only the dynamical laws and imposes no re-randomizing. The kinetic equation is taken as having its solution curve give the sequence of 'most probable states' of a collection of systems all started in a common non-equilibrium condition, but having different initial micro-states.

The latter approach tries to show that in a different idealized circumstance (the Boltzmann-Grad limit) the kinetic equation solution can be correctly asserted to show, at least for short time intervals, the overwhelmingly probable evolution of members of a collection of systems described by a special initial probability distribution.

Important questions arise as to the nature and role of the idealizations used and the kind of probabilistic explanation of the experimentally determined nature of approach to equilibrium offered by these alternative

accounts. Especially important is the observation that they offer accounts of the physical processes that are conceptually at odds with one another, although they are not contradictory to one another since they posit quite different idealizations.

4 Asymmetry in time

A core issue of non-equilibrium theory remains the attempt to find an appropriate physical explanation for the fact that macroscopic systems show asymmetry in time in their thermodynamic features, whereas the underlying laws governing the micro-constituents are taken to be time-symmetric.

A number of unorthodox approaches to the problem exist. In some the underlying dynamical laws have their time symmetry denied. In others the origin of time asymmetry of systems, systems usually taken to be energetically isolated from the world, is accounted for in terms of their ineliminable residual causal interaction with their external environments. A subjectivist approach to the second law exists as well.

In the orthodox accounts a crucial role is played by the initial probability distribution over micro-states assigned to a non-equilibrium system. In the ‘rigorous derivation’ approach, this initial probability assignment is necessary to derive the asymmetric Boltzmann behaviour. In the ‘mixing’ approach it is noted that mixing and its generalizations are all time-symmetric notions. But whereas a non-equilibrium system will coarsely approach equilibrium in both the infinite future and the infinite past, it is possible to specify an initial probability distribution that will behave asymmetrically in time for finite time intervals. Another approach, due to Prigogine (1980), focuses on singular initial probability distributions to break the time symmetry.

In order to account for the asymmetry in time of the behaviour of individual systems, resort is often made to the behaviour in time of the cosmos as a whole. In the new cosmological models one thinks of the overall universe not as in equilibrium, as Boltzmann speculated it was, but as in expansion from an initial Big Bang singularity and showing entropic increase.

Why does the entropy of the universe increase in time? Some accounts (Gold) tie the entropy increase to the expansion of the universe. The more common view is, however, that expansion by itself will not explain the entropic asymmetry of the cosmos. Rather one must assume an initial low-entropy state for the universe, not paralleled by a low-entropy final state. One important version of this approach (Penrose) takes the initial low entropy to be found in the ‘smooth’ initial spacetime structure (see Cosmology §3). The matter of the world starts thermalized and then clumps into hot stars living in cold space, the decrease in entropy of the matter being paid for by the increased ‘clumpiness’ of spacetime, a change that corresponds to an increase of entropy overall.

Many profound philosophical questions arise when one speculates about what kind of an answer could be given to such questions as: ‘why is the initial entropy of the universe so surprisingly low?’ Here philosophical discussion is reminiscent of older arguments about the origin of order in the universe and teleological arguments for the existence of a deity.

The purpose of invoking the entropic asymmetry of the cosmos as a whole was to give a physical account of the ground of the second law of thermodynamics. But cosmic entropy increase can perform this task only if it can be shown that it can account for the parallel increase in entropy in time of the individual systems with which the second law deals. Reichenbach calls these individual systems, energetically isolated from the overall cosmos only for finite time intervals, ‘branch systems’ (Reichenbach 1956).

One could simply posit that branch systems show an entropy asymmetry in time parallel to one another and parallel in time to the entropic asymmetry of the cosmic system. Several proposals exist to do away with this posit, but all of them, including Reichenbach’s own (positing that the collection of branch systems constitutes what he called a ‘lattice of mixture’), ultimately introduce parallelism of the direction of entropy increase for the branch systems with each other and with the main system as a posit. The physical origin of the temporal asymmetry of systems remains a very controversial subject.

5 The direction of time

Suppose we accept it as a fact that branch systems do indeed show parallel increase of entropy in the same direction of time. The question remains, ‘Why do systems have their entropy increase towards the future and not

towards the past?' It was Boltzmann who first suggested the answer that our very conception of the past-future distinction in time is one that is itself founded upon the asymmetry in time of the entropy of systems. What counts as the future direction of time, he claimed, is just the direction of time in which systems have their entropy increasing.

In order to evaluate this claim one needs to know what it really amounts to. It is sometimes suggested that the claim amounts to the assertion that we determine which direction of time is the future by examining the entropic states of systems. Thus we can tell if a film has been put in a projector in the correct direction only by consulting the entropic features of the states it pictures. But such an understanding of Boltzmann's claim founders on the fact that we have direct, non-inferential knowledge for many pairs of states as to which member of the pair is later than the other.

A more plausible reading of the Boltzmann claim takes it that entropic facts ground our intuitive means for determining time order in much the same way that facts about gravity ground our distinction between the directions in space we take as upward and downward. From this point of view the entropic asymmetry of the world offers a full explanatory account of all the other general asymmetries of the world we intuitively take to hold. These intuitive asymmetries include our differential epistemic access to past and future (we remember the past and have records of it, but not the future); the direction of causation from past to future; our differential concern with past and future; and the alleged 'fixity' of the past but openness of the future. Although interesting arguments have been given to back up this claim, it remains an open one (see Causation; Time).

Thielicke, Helmut (1908-86)

Helmut Thielicke presented a systematic Christian theology with particular reference to concrete issues and situations within the world. He held that statements about God are inevitably conditioned by the fact that God reveals himself to and through humanity; they thus always have an anthropological aspect. Similarly, while theology arises from transcendent revelation, it necessarily belongs to a particular historical context. Thielicke maintained that the notion of a 'perennial theology' is therefore mistaken. This raises the question as to whether it is a perennial truth that there is no perennial theology, and, if so, how Thielicke could, on his grounds, know this.

Born in 1908, Helmut Thielicke was a Lutheran theologian whose preaching was silenced by the Nazis in 1940. He was a professor at Heidelberg, Tübingen and, from 1954, Hamburg. He died in 1986.

Thielicke expounded a Lutheran (but also typically Christian) doctrine of justification, the doctrine of forgiveness of sins through the death and resurrection of Christ. He aimed to decline 'the doctrine of justification through all the case forms in which it appears within the grammar of our existence' ([1959] 1969: xiv). As the Latin professor teaches by putting nouns through their declensions, Thielicke presented Christian theology by weaving a Christian perspective on politics, society, economics, sexuality, law and art. He used concrete issues (for example, truthfulness at the sick bed) as models: the doctrines and principles of Christian ethics are explained in terms of specific situations and described in detail. He wrote:

> Since God discloses himself in man and seeks to be his God, any statement about God is also a statement about his relation to man. To that degree man is there in every theological utterance and thus gives it an anthropological reference… [this] book is about the relation between God and man and not about a purely transcendent God taken theistically in and for himself. I understand primarily by this relation an ontic rather than a noetic relation. Man 'is' his relation to God. He is the one created by him, in flight from him, visited by him and justified.
>
> ([1968] 1974: 15)

That each human person is created and constantly sustained by God, and that each person's good lies in trust and obedience to God, structures Thielicke's ethic.

Thielicke saw it as the nature of theology to respond to challenges. In this lies its potential for growth and continued relevance. He sought a worldview that was uncompromisingly Christian, preachable in and to the Church, and plainly of relevance to moral problems. He interacted with the best of contemporary thought without sacrificing the distinctiveness of the Christian gospel.

In *Der evangelische Glaube* (*The Evangelical Faith*), he wrote that:

> [God's] Word is historical not merely in the sense of being grounded in history [that is, in part concerning the religious significance of historical events in Israel's history and the life of Jesus] but also as it is addressed to historical situation. Both the authors and the recipients of verbal messages are subject to the process of history. The message, then, cannot be detached at either point. If an effort is made in this direction, there arises the false notion of perennial theology characterized by an abstract conceptual system. Scholasticism and seventeenth century orthodoxy are classical examples.
>
> ([1968] 1974: 23)

Theology necessarily arises from a transcendent revelation conditioned by the cultural context of, and the challenges peculiar to, a particular time. It exists in an inescapable tension, requiring faithfulness to its status as revelation and sensitivity to the historically conditioned nature of its proclamations. In effect, Thielicke wanted to retain what he saw as the best in his evangelical colleagues and his neo-orthodox predecessors (such as Karl Barth and Emil Brunner).

There remains this question: can a theology that allows only the sorts of statements about God that Thielicke permitted have any content, let alone respond to contemporary challenges? If there are no statements concerning

God save those that describe God's relations to humans, then those relational statements themselves do not inform us about God's nature. But then it is hard to see what the relational statements themselves mean. If 'God loves us' does not entail 'God is by nature loving', or anything else about God's nature, it is unclear just what 'loves' means.

In addition, Thielicke's statement that theology must rest on a transcendent revelation only expressible in the terms of some particular culture is itself expressed in the terms of Thielicke's culture. Yet it is supposed to be categorically and universally true, and hence it is supposed to escape being conditioned by Thielicke's culture. But if that statement can somehow, or in some degree, escape such conditioning, is it impossible that theological claims should somehow, or in some degree, do so as well?

Thierry of Chartres (*fl. c.*1130-50)

Thierry of Chartres, who taught at Paris and Chartres in the mid-twelfth century, was a polymath and a Platonist. The Heptateuchon, a large and ambitious collection of texts for teaching the liberal arts, testifies to the range of his interests from grammar, logic and rhetoric to mathematics and astronomy; they also stretched to theology. To Thierry is attributed an explanation of the account of creation in Genesis, after God's initial action, in physical terms. He also used arithmetical analogies to illustrate the Trinity and, drawing on a variety of Platonic and Neoplatonic sources, analysed the relationship between God and his creation.

Thierry of Chartres was born in Brittany (he usually called himself Theodoricus Brito, Thierry the Breton). In the 1140s he was chancellor of Chartres Cathedral, before he retired in the 1150s to a monastery. He taught, almost certainly in both Paris and Chartres, from the 1130s or earlier. Among his pupils were John of Salisbury, the grammarian Peter Helias and the scientist and translator Hermann of Carinthia, who described him as 'the soul of Plato restored to mankind from heaven'. Unfortunately, the records of his wide range of teaching are scant. His commentaries (*c.*1130-9) on the two main textbooks of rhetoric, Cicero's *On Invention* and the pseudo-Ciceronian *Rhetorica ad Herennium* survive. His logical writings have been lost, although Thierry is known to have been one of the earliest writers to teach Aristotle's *On Sophistical Refutations* (before 1132) and perhaps also the *Prior Analytics*. He also taught grammar, and the *Heptateuchon* (which includes extracts from Euclid and al-Khwarizmi's astronomical tables) shows his lively interest in the various branches of mathematics. Thierry's modern reputation as a philosopher depends mainly, however, on a short treatise *De sex dierum operibus (On the Work of the Six Days)* and on various commentaries and glosses to Boethius' theological treatises (*Opuscula sacra*). Yet these too pose considerable problems of integrity and authorship.

It was Thierry's pupil Clarembald of Arras who gave *De sex dierum operibus* its title and attributed it to Thierry. He added to it a further collection of remarks on Genesis, taken from Thierry's lectures. Sir Richard Southern's suggestion (Southern 1970) that the treatise itself (which circulated separately in other manuscripts) was also reworked by Clarembald is implausible; but the work is certainly unfinished in all surviving copies. As it stands, it divides into two parts. The first offers what is called a 'natural and literal' exposition of the first five verses of Genesis. Here Thierry is following a tradition going back to Augustine and the Greek Fathers of using scientific material to gloss and expand the biblical account of creation. However, he is unusually rigorous in restricting himself to naturalistic explanation, drawing on Plato's *Timaeus* and Calcidius' commentary and using a number of ideas he may have taken from William of Conches. The second section is a long (and unfinished) digression on the nature of God and his triunity. Thierry promises to use four methods of mathematical reasoning to lead us to knowledge of the creator, arithmetical, musical, geometrical and astronomical; but only the arithmetical 'proofs' are preserved. God, who is the 'form of being' for individual things, is unity. The unities from which numbers are made are participations in this divine unity. The Son is related to the Father as 'equality' to unity and, when the treatise breaks off, Thierry is about to discuss the Holy Spirit as the link (*connexio*) between unity and equality.

To Clarembald also is owed the identification of Thierry's most important philosophical work. From his remarks, it is clear that Clarembald based his own commentary on Boethius' *De trinitate* (On the Trinity) mainly on Thierry; and comparison shows that a commentary known as *Librum hunc* (written late 1140s; incipit 'Inchoantibus librum hunc', edited as the *Commentum*) is, or closely resembles, Clarembald's source. *Librum hunc*, therefore, is certainly based on Thierry's teaching, but exactly how accurately remains an open question. Two other commentaries on the *De trinitate* related to *Librum hunc* have been argued by his editor to be later works of Thierry: the *Lectiones (Lectures: incipit 'Intentio auctoris')* and the *Glosa* (Gloss: incipit 'Aggreditur propositum'). But do the doctrines they contain, often at variance with those of *Librum hunc*, all go back to the same man?

Besides developing a numerological account of the Trinity similar to that in Thierry's treatise on the creation, *Librum hunc* shows a concern to develop Boethius' somewhat disparate remarks on matter and form into a theory about God's relation to his creation. God is said to be the only true form. By contact with matter this form is determined into forms of different kinds (humanity, stone-ness and so on). These forms cannot exist apart from the individuals they inform. Were there to be, for instance, no human beings, the form humanity would lose its specific

identity and return to the simplicity of the one true form, God. Both the *Lectiones* and the *Glosa* share this view of God as the single true form, but they also admit a multiplicity of pure forms as ideas in the mind of God; and the *Glosa* elaborates this plan in terms of act and potentiality. Peter Dronke has made a bold attempt to find a unity of thought in these various works by or connected with Thierry. He argues (looking to the *Lectiones* and the *Glosa*) that Thierry distinguished four modes of envisaging the universe: as 'absolute necessity' or the 'form of forms'; 'necessity of make-up' (linked to Ideas, natural law and the World Soul); absolute possibility (primordial matter); and determinate possibility (contingent reality). By using this diversity of perspectives, Thierry is able to reconcile 'an extreme Platonism - in which forms and names exist indissolubly in the mind of God, and in which "names essentiate things" - with a far reaching naturalism' (Dronke 1988: 384).

Thomas of York (*fl. c.*1255)

A philosopher of remarkably wide reading in the works of Western and non-Western thinkers, Thomas attempted to assemble, and to some extent to synthesize, the views he had encountered. Whatever the eventual judgement on Thomas' thought, the Sapientiale (Wisdom), a lengthy metaphysical work, certainly reflects the intellectual ferment brought about in the thirteenth century by the influx of new works by Aristotle and by Jewish and Islamic philosophers and commentators.

A member of the Franciscan order from at least 1245, Thomas of York incepted as master of theology at Oxford in 1253. He was lecturer to the Oxford Franciscans until 1256, and to the Cambridge convent in 1256-7. He wrote a work entitled the *Manus quae contra omnipotentem (The Hand That is Raised Against the Omnipotent)*, a polemic work defending voluntary poverty and mendicancy, but his most important philosophical work is the *Sapientiale (Wisdom)*.

The *Sapientiale* is a summa - or it might be more properly called a compendium - of arguments addressing what Thomas labels as 'general' and 'special' metaphysics. The first five books discuss God, creation, being and causation, substance and accident, and attributes of being such as truth and falsity, while the remaining section on special metaphysics discusses the soul. The second section is incomplete: it breaks off unfinished, omitting projected discussions of the inanimate world and of plants and animals. Prominent throughout is Thomas' concern to include extensive and accurate citations from a very wide range of sources (including writers of antiquity, Jewish and Islamic philosophers and commentators, patristic writers and Thomas's predecessors at Oxford and Paris), and where possible to adjudicate between or reconcile opposed views. In addition to the difficulty of fixing Thomas' views amid the remarkable breadth and extent of his citations - unmatched in any later Franciscan philosophical work - there is the problem that an edition of the *Sapientiale* is not yet available.

In his general metaphysics, Thomas develops an elaborate explanation of the natures of matter and form. While the complexity of his scheme may in part be attributed to his efforts to accommodate both Aristotelian and Neoplatonic systems, its intrinsic interest has yet to be evaluated. Thomas equates form and matter with act and potency, and identifies these as the two principles of created being. Not willing to admit a third principle, he classes privation as an attribute of matter. However, since not all matter is subject to privation, he must distinguish three varieties of matter: 1) matter subject to privation, and hence to generation and corruption; 2) matter having dimension and location, but not subject to privation (such as heavenly bodies); and 3) 'spiritual matter', a potentiality capable of taking on form but neither subject to privation nor having any particular location or dimension. Thomas also distinguishes a 'potential' variety of form. He attempts to reconcile those who insist that common forms or natures (such as 'man' or 'white') exist independently, separate from their realization in matter and outside the minds of those who understand them, with their opponents who deny any such separate existence to forms. He does so by proposing that common forms do exist outside the mind, for otherwise demonstrative knowledge would be impossible, but that their external existence is merely potential, awaiting realization in matter.

Thomas' special metaphysics focuses on the human soul but does not, as might be expected, discuss philosophical psychology. Instead, it is largely devoted to the metaphysics of the rational soul, arguing that the soul is not a form but rather is compounded from form and spiritual matter and related to the body as a pilot to a ship. (Thomas does not offer any solution to the potential difficulty that creatures with souls would then seem to have more than one substantial form.) Considerable attention has nonetheless been devoted to Thomas's philosophy of mind. However, granted that Thomas affirms earlier in the *Sapientiale* that some human knowledge derives 'from something higher and not from sense', and that he notes the incompleteness of Aristotle's account of the soul - the only one, he says, to assert that all knowledge stems from the senses - Thomas nonetheless devotes the bulk of his attention to explaining how the intellect apprehends though a process of abstraction from the data of sensory perception. His acceptance that some human knowledge derives from divine illumination is standard rather than controversial: Aquinas, whom it has been suggested he opposed on this issue, also granted it a restricted role.

Thomas White (1593-1676)

Thomas White's reputation has suffered unmerited decline since he was described by John Evelyn in 1651 as 'a learned priest and famous philosopher'. His works embrace theology, metaphysics, natural philosophy and political theory. The leader of a minority faction of English Catholics, known after his alias as 'Blackloists', White's overall intellectual position is determinedly antisceptical, characterized by a certainty-seeking synthesis of old and new. The traditional Aristotelianism of his own education is blended with aspects of the 'new philosophy' which he encountered in the 1640s; and in this respect White stands as an important representative of the intellectually turbulent times in which he lived.

As an English Catholic, White was educated in continental Europe. He was particularly associated with the English College at Douai, where he was ordained as a priest in 1617, and at which for some years he taught scholastic philosophy, or 'rigid Thomistry'. His ideas were extended during periods in Rome from 1625-9, in Paris in the 1640s and in London after 1655. His intellectual contacts included members of the Mersenne circle and of the embryonic Royal Society (see Mersenne, M.). White's thought is remarkable for embracing such varied influences within an essentially Aristotelian framework.

White's antisceptical metaphysics is most clearly outlined in his debate with Joseph Glanvill. Responding to the fashionably Pyrrhonian *Vanity of Dogmatizing* (1661), White argues in his *Sciri, sive sceptices* (1663) that a sceptical denial of the possibility of certain knowledge not only insults past and present philosophers, but also threatens the very basis of morality. Seeking some fundamental starting-point, and specifically rejecting the validity of Descartes' introspective quest for an infallible generator of knowledge, White resorts to an essentially Aristotelian, logical procedure. He thus assumes the existence of some unquestionable 'identical propositions', from which certain knowledge can be generated: in its simplest form, what is, is, and 'whilst it is, it cannot not-be'. This invincible truth provides at least one 'first step' against the sceptics.

As a second step, 'self-known propositions' are cited. For example, a number must be odd or even, on the assumption that 'even and not-even are all'; or a man must be an animal, where 'rational animal' is subsumed within the category 'animal'. From such propositions, it is then possible to proceed by syllogistic reasoning: thus, we may start with the self-known propositions that 'every man is an animal', and that 'every animal is a living creature', and from these we may go on justifiably to conclude that what is a 'man' is a 'living creature'. Though obviously limited in scope, such examples served to demonstrate for White that at least some certain knowledge was in principle possible; and on this solid foundation, more could then be built.

The defeat of scepticism was particularly important in a theological (and related moral) context. Though denying some important Catholic orthodoxies, including the widespread belief in papal authority and conventional notions of purgatory, White retained an emphasis on 'tradition' as the rule of faith, and additionally synthesized theology with his own brand of natural philosophy, to produce a so-called 'philosophical divinity'. Catholic tradition was to be seen as perfectly compatible with a natural philosophy grounded on Aristotelian first-principles and incorporating important elements of the new science. White's approach here is well illustrated in the Theological Appendix to his *Institutionum Peripateticarum* (1646). Here the seemingly miraculous story of the Flood is shown to be in perfect conformity with the rational and empirical methods of the new science; and the two approaches are to be seen as mutually-supportive in their stand against scepticism.

White's natural philosophy is best studied in *De Mundo* (1642) and *Institutionum Peripateticarum* (1646). It is, again, particularly interesting for its synthesizing of old and new philosophies. This is evident in both cosmology and physics. With some ambiguities, Copernican cosmology can be shown to be consistent with Aristotelian philosophy and Christian theology. Thus while heliocentrism is nominally accepted, the earth is still described as 'situated in the very middle of the universe': this apparent anomaly can allegedly be justified by identifying the 'middle' not with the centre of the terrestrial globe but with the whole circumference of the earth's orbit; and that ploy is legitimated by reference to the magnitude of the universe, in terms of which that circumference is itself a mere 'point'. The earth's continuing motor (still required by an Aristotelian) is found in the wind acting on contiguous sea; and the air surrounding the earth is also assumed to move, circumventing another traditional scholastic argument. Finally, Christian scripturally-based insistence on an immobile earth can be appeased by an

appeal to the relativity of motion, in terms of which 'both statements are made with absolute correctness and accuracy: that the earth has been continually moved with regard to the sun, and the sun with respect to the earth'.

White's ambivalence in cosmology is paralleled in his physics: retaining such Aristotelian premises as the impossibility of a vacuum, motion's need of a mover, and the infinite divisibility of a continuum, he subscribes none the less to a form of atomic theory, by conflating newly-revived Epicurean 'atoms' with traditional Aristotelian 'minima'. In this White may be compared to his fellow-Blackloist friend Kenelm Digby.

Blackloist political philosophy is outlined in White's *Grounds of Obedience and Government* (1655). Aiming for toleration of Catholic worship, and from the starting-point of 'salus populi', White argues essentially for a contract theory, whereby the king's power is held in trust for the people. Revolution may therefore be justified; and in practical terms Catholics should accept the *de facto* rule of Cromwell. White's outspokenness proved his downfall: following the restoration of the monarchy he was repudiated by Protestants and fellow-Catholics alike, and was all but lost to history.

Thomas à Kempis (1379/80-1471)

*Thomas Hemerken was born in Kempen, Germany. He spent his life in foundations of the Modern Devotion (*Devotio Moderna*), a spiritual movement of the late fourteenth and fifteenth centuries that originated in the Low Countries and spread throughout northern Europe. In 1406 he entered the monastery of Mount Saint Agnes in Windesheim (St Agnietenberg, the Netherlands), the origin and centre of a reformed congregation of Augustinian Canons Regular, which disseminated the Modern Devotion in the Low Countries and Germany. Thomas was ordained a priest in 1413, and was the novice master in the monastery for many years. He is generally recognized as the author of De imitatione Christi (The Imitation of Christ), perhaps the most popular work on the spiritual life ever written.*

Thomas wrote a number of spiritual and ascetic treatises, meditations on the life of Christ, lives of the leading figures of the Modern Devotion and a chronicle of his monastery. Most of these writings can be related to his duties as novice master. He is most famous as the author of *De imitatione Christi (The Imitation of Christ)*. His authorship of this work, however, has always been disputed. His claim rests mainly on the tradition of his religious order. *De imitatione Christi* comprises four treatises, composed separately. Some early copies (1420s) of the treatises attribute them to Thomas, but most are anonymous. Thomas copied the treatises more than once; one copy made by him, containing the four treatises and completed in 1441, bears corrections indicating that he worked on the manuscript for many years. The manuscript suggests that if Thomas was not the original composer of all the texts, he was their compiler and editor. However, none of the evidence is conclusive. Other evidence points to a Carthusian monk as the author, possibly as early as the end of the fourteenth century; Carthusians were closely associated with early foundations of the Modern Devotion, and through them the core texts of *De imitatione Christi* may have circulated among the Devout (that is, the followers of the Modern Devotion).

The style of *De imitatione* complicates attribution. The Devout were accustomed to collect texts of spiritual authorities, ordering them under general topics for their meditation and personal use. The books of *De imitatione* are related to such collections, weaving together ‘sentences’, or moral and psychological maxims, into a continuous discourse. The ‘sentences’ of *De imitatione* are drawn largely from the Scriptures, but also from anonymous teachers and a few named authorities. Doubtless the author crafted his own ‘sentences’ as well. Such a text readily became the common property of those in the monastic life; perhaps this is why *De imitatione* was later ascribed to so many authors.

Similarly, the treatises of *De imitatione* express the common themes of the Modern Devotion. They develop the dialectic between the world and the kingdom of God, which is within. They contrast the vanity of the world, the emptiness of sensible goods, false happiness, self-love and the pride of the intellect with the inner life of the kingdom of God, which requires purification of the senses and mind, abandonment to God, obedience, patience, humility and the practice of divine charity, which directs every act to God. These virtues yield interior peace (the ordering and calming of desires and passions), interior freedom (liberation from concupiscence and regard for human esteem), and simplicity of spirit. Christ is the exemplar of the soul’s dispositions; only by participation in, and responsiveness to, his divine grace can the disorder of sinful human nature be repaired and the kingdom of God within be attained. *De imitatione* seeks a practical reform of Christian life, in principle accessible to all. It avoids complex questions concerning mystical contemplation.

Although in its time the devotion of *De imitatione* was called ‘new’, it in fact echoes an older Christian wisdom, the chief sources of which are Augustine, Gregory the Great, John Cassian and Bernard of Clairvaux (see Patristic philosophy). Devout authors were sceptical of theological speculation which, they thought, induced vanity and was a diversion from the evangelical life. Some historians nevertheless see the Modern Devotion as a coefficient of the religious attitude underlying the scholastic *via moderna*. This interpretation is not wholly convincing. The ‘philosophic’ roots of *De imitatione Christi* lie elsewhere, as its ‘sententious’ and ‘gathering’ style suggests. The letters of Seneca, which treat self-knowledge, recollection of the memory, the ordering of the passions, and the necessity of solitude, were favourite readings among the Devout and the earlier monastic writers who inspired their spiritual teaching. The author of *De imitatione* adapts Stoic psychological teaching to the narrative of Christ’s life and death and to the Christian doctrines of sin, grace and redemption (see Stoicism).

Thomasius (Thomas), Christian (1655-1728)

Christian Thomasius' stature as the 'founder' of the German Enlightenment has been the source of much debate. His many essays dealing with issues in moral enlightenment and law reform (bigamy, witchcraft, torture, heresy, adultery, the use of the vernacular and so on) certainly single him out from other seventeenth-century writers. He was the public philosopher par excellence, a suitable match for August Hermann Francke, the great public theologian. Both men spent most of their career in Halle (in Brandenburg), and it was there that Francke institutionalized pietism, just as Thomasius propagated secular natural law theory. Despite many tensions, pietism and modern natural law thereby fused into a social duty-ethics that was of the greatest importance in shaping the modern Prussian state. The basis for natural law was God's will and it was the attempt to follow this law that made humanity a moral species. Since humankind could not have any certain knowledge of the content *of God's law, the natural powers of the mind would have to be relied upon, and Thomasius' thought was an investigation into the nature and social effect of these powers. His best-known result was a series of linked divisions between law and morality, between public and private spheres, between external and internal obligation, and between action and intention.*

1 Life

Christian Thomasius was born in Leipzig, Saxony, the son of the jurist and philosopher Jacob Thomasius. He was educated at the University of Leipzig by Valentin Alberti, one of the most prominent critics of Pufendorf, and by his own father who some years previously had taught Leibniz. Thomasius took his law degree at the University of Frankfurt an der Oder in 1679. He spent his early career in Leipzig as an advocate, private lecturer and founder of a controversial periodical, *Monatsgespräche* (Monthly conversations), the first intellectual monthly written in German. He made it his cause to criticize Aristotelianism, orthodox Lutheranism and Roman jurisprudence, and his public doubts about the divine right of kingship eventually made it prudent for him to leave Saxony in 1690. His alternative programme of German history, natural law and German jurisprudence was, however, welcome in neighbouring Brandenburg, where Thomasius was instrumental in the foundation of the University of Halle in 1694. In 1710 he became Direktor (President) for life of this institution which had a formative influence on German Enlightenment universities. By the time of his death here in 1728, Thomasius had established himself as a towering cultural figure, with a public philosophy promoting polite sociability.

2 Theoretical philosophy

From a philosophical point of view, Thomasius' huge *oeuvre* divides into three periods. In the 1680s he worked to complete Pufendorf's project of separating natural law from theology, culminating in 1688 with *Institutiones jurisprudentiæ divinæ (Institutions of divine jurisprudence)*. This was accompanied by *An Introduction to Court Philosophy* - that is to say, a theory of the centralist political culture that was necessary to maintain a state based upon the law of reason alone. Thomasius' reaction against orthodoxy broadened to a comprehensive philosophical outlook, resulting in works on reason and on moral theory in the 1690s. Strongly influenced by pietism, Thomasius pursued his doubts about the sufficiency of reason in the conduct of life, leading him to a spiritualist metaphysics in the tradition of fashionable mysticism. This prepared the way for a change after 1700 to a deterministic theory of the will and a scheme of moral, legal and political regulation based on governance of the passions.

Thomasius owed much to the long tradition of eclecticism in philosophy, but he can hardly be called an eclectic in a strict sense. His debt to eclecticism was largely methodological, not a substantive philosophical doctrine. And while he argued against the dominance of Aristotelianism and Cartesianism and other schools, he did not, in the manner of eclecticism, see his philosophy as inherently an argument for the freedom of the individual spirit from the tyranny of all 'sects'.

His epistemology was a basic empiricism inspired by Aristotle and, subsequently, reinforced by his reading of Locke's *Essay* (see Empiricism). But although he maintained that all knowledge has a basis in experience, Thomasius retained the notion of ideas of reason that are merely *awoken* through experience. These have a universality and certainty missing from the merely probable knowledge that is formed inductively from experience. It never becomes clear whether the ideas of reason are a remnant of humanity's pristine nature before the Fall. In that condition, Thomasius suggests, each person, from birth, was able immediately to apprehend the

very nature of things and actions. After the Fall, experience, including the sciences, has to make up for this loss of insight into the essence of life and the world by piecing together such appearances as humanity can manage. Any success in this endeavour presupposes a systematic critique of all prejudices and this is in effect an implementation of systematic doubt - not ‘sceptical’ Cartesian doubt which is contradictory in denying the possibility of truth and falsehood, but ‘dogmatic’ doubt premised on such a possibility.

The world is, for Thomasius, ultimately spiritual; each thing is a living being with a purpose. But humans stand out as the only beings not entirely determined by their purpose but prone to error through the influence of other aims. He develops a theory of the passions to account for these pervasive aberrations, while his moral theory concerns the moral rules and institutions that allow us to live in pursuit of moral aims that, ultimately, are beyond most of us in this life. The great change in Thomasius is that in the earlier work, passions and morals are vying for control of a free will; but from his 1705 work *Fundamenta juris naturae et gentium ex sensu communi deducta (Foundations of the Law of Nature and of Nations, deduced from Common Sense)* onwards, morality is an epiphenomenon in a deterministic world.

3 Practical philosophy

In practical philosophy, Thomasius’ starting-point was Samuel von Pufendorf and, in a sense, this remained the case across the otherwise dramatic developments of his ideas. The Pufendorfian-Thomasian theory is profoundly voluntarist in the sense that it sees all moral values - in fact, all values - as directly or indirectly dependent upon acts of will. No thing (such as a creature), no state of affairs (such as a relationship between creatures), and no event (such as an act of one creature towards another) has any *inherent* value. Human acts of will are in themselves nothing but natural events, and only assume a moral aspect through their relationship to the law of nature; the law of nature is only a moral law because it is God’s will.

Much intellectual energy was spent during Thomasius’ generation on the obvious problem that this line of argument simply transforms the question of the foundation of morals into the question of the goodness of God, and Thomasius’ early work is first of all a contribution to this debate. His answer was that it is impious to raise the question of God’s goodness, for it assumes that there is enough in common between God and humans to make sense of such a question; but we can know nothing whatsoever by natural means about God - except the bare fact that we are obliged to obey his will. Even if we could know God’s goodness, this would not imply *what* we should do, if it were not for the fact that God, in addition to being good, also would will us to do what his goodness implies. We here meet the common assumption that obligation arises only from a law imposed by a superior. In sum, we know that we are obliged to obey God’s will but also that we do not have a sufficient notion of God from which we can derive what our actual duties are. As a consequence, we have to turn to that which God’s will has left us with, namely our reason. In this way Thomasius effectively excludes theology from any role in the theory of morals, including jurisprudence.

Central to the concept of reason upon which Thomasius relies is the idea of a dialogue or conversation. Reasoning consists of the manipulation of signs, and we learn the use of signs only in dealing with other people. So, without some minimum of social living, there could be no language and no ability to reason; these functions are interdependent. They are also distinctive for humanity, and they are the means by which we alone can live under the guidance of natural law. It is through reason that we can reflect upon the fact that we would not have reason if we were not social, and that we could not be social if others were not reasoning likewise. Thomasius takes these undeniable facts as the best indication we have of what God’s will for us is, namely that we should always act so as to benefit the whole of humanity considered as rational and social. This *utilitas totius humani generis* is again to be understood as *pax* or *vita tranquilla*, peace or the quiet life with others, and this can also be characterized as the essence of temporal happiness, *beatitudo*. This rational sociality (*socialitas* or *Geselligkeit*) is the basic natural law and thus the foundation for all society (*societas* or *Gesellschaft*).

In the 1688 work, the *Institutiones jurisprudentiae divinae*, Thomasius thus identified morality with a broad concept of obligation to natural law or, in other words, justice. He never indicated any room for other areas of morality nor tried to differentiate the concept of natural law to make room for such areas; in fact, he simply followed Pufendorf’s traditional division according to the objects of the duties imposed by natural law, namely God, other people and oneself. However, Thomasius was certainly at work on this problem. Just four years after the *Institutiones*, he published a different account of morals in *Einleitung zur Sitten Lehre*. Morality is now seen as

based on love rather than sociality, but the nature of love is that it cannot be enforced and this is the distinguishing characteristic of morality as opposed to justice and law. The acts that comprise justice - giving each their due, abstaining from injury and so on - may be done out of neighbourly love, but they may also be enforced, in which case they move from love to justice, from morality to law.

In the *Einleitung* Thomasius pays little attention to justice and the foundation of law; his concern is to develop a theory of morality as rational love. This is a topic which we cannot pursue here, just as we have to ignore Thomasius' prolonged despair at making sense of the way in which reason might be said to regulate the love of humanity as the basis for the moral life. He could not see how a free will could escape the storms of passion and make any moral progress merely by rational means; the only way was to lose itself in mystical identification with God.

Thomasius escaped this pietistic replacement of morality by faith through a rejection of the idea of free will. Instead, he regarded the will as determined by the good, and developed a theory of the varieties of goods in life that we may cultivate as the objects of will. This was the basis for his attempt in the late work, especially the *Fundamenta* (1705), to put together a theory that could accommodate both the theory of justice and law, and the theory of morality, and to account for their difference.

The starting point is an identification of the good with peace or quietness of life that can be either internal - peace of mind - or external - security of action. Further, the external peace can either be a purely negative matter of being left in peace, or it can be a matter of having one's welfare actively secured or promoted. This is the basis for Thomasius' famous distinction between *honestum, justum* and *decorum*. Actions that contribute to or are in accordance with the inner peace or balance of a person make up the *honestum*. This is the sphere of morality proper, for such actions are obligatory as part of the moral nature God has prescribed for humanity, but they are only obligatory internally, in conscience, and cannot be enforced - like acts of love, they would lose their specific moral character if enforced. Actions that simply avoid breaking the external peace make up the *justum*; they carry external obligation or obligation to action, and they are enforceable and thus suitable objects of positive legislation. Actions that actively promote the external quiet of life, finally, make up the *decorum*. They are externally obligatory but not enforceable; they thus provide a middle way between the *honestum* and the *justum*, between morality and law, and they are characterized as prudence, or politics.

4 Conclusion

Thomasius' threefold division of morals made available much clearer conceptual and linguistic means than previously for distinguishing between law and morality, and thus between public and private spheres. It also showed just how easily voluntaristic natural law could lose most of its meaning *as* natural law. The gain and the loss went hand in hand as follows: once the basic obligation to morality - or natural law - is reduced to mere obedience to the supreme divine will, all content of this law has to be derived from temporal sources, that is, from human acts of will. But the investigation of human voluntary activity invites empirical methods, and much of Thomasius' progress consisted of his erratic acceptance of this invitation, resulting in a combination of a kind of philosophical anthropology and moral, especially legal, history based upon his three spheres of *honestum*, *justum* and *decorum*. Morals and law are thus increasingly seen as historical or cultural - in the broad sense, conventional - phenomena, and it is not evident that any objectively or universally valid *natural* law is left on the basis of which they could be criticized and changed. At the same time, of course, his linked divisions between law and morality, between public and private, between external and internal obligation, between action and intention, were tools to be taken up and refined by Kant in a way that was far from Thomasius' own troubled Lutheran horizon (see Kant, I. §§9-10).

Of Thomasius' many students and disciples, the most prominent include the theologian Johann Franz Budde (Buddeus), the philosopher Nicolaus Hieronymus Gundling and the legal theorist Johann Peter von Ludewig. He was also influential in the new University of Göttingen, but more in jurisprudence than in philosophy, and especially on J.J. Schmauß and Gottfried Achenwall, whose textbook was used by Kant. But despite their numbers, the Thomasius students never formed a 'school' as did followers of Wolff, partly because the master was difficult to get on with, partly because the Wolff-gang swept the field.

Thomism

Deriving from Thomas Aquinas in the thirteenth century, Thomism is a body of philosophical and theological ideas that seeks to articulate the intellectual content of Catholic Christianity. In its nineteenth and twentieth-century revivals Thomism has often characterized itself as the 'perennial philosophy'. This description has several aspects: first, the suggestion that there is a set of central and enduring philosophical questions about reality, knowledge and value; second, that Thomism offers an ever-relevant set of answers to these; and third, that these answers constitute an integrated philosophical system.

In its general orientation Thomism is indeed preoccupied with an ancient philosophical agenda and does claim to offer a comprehensive, non-sceptical and realist response based on a synthesis of Greek thought - in particular that of Aristotle - and Judaeo-Christian religious doctrines. However, in their concern to emphasize the continuity of their tradition, Thomists have sometimes overlooked the extent to which it is reinterpretative of its earlier phases. The period from the original writings of Thomas Aquinas to late twentieth-century neo-scholastic and 'analytical' Thomism covers eight centuries and a stretch of intellectual history more varied in its composition than any other comparable period.

Not only have some self-proclaimed Thomists held positions with which Aquinas would probably have taken issue, some have advanced claims that he would not have been able to understand. Examples of the first are found in Neo-Kantian treatments of epistemology and ethics favoured by some twentieth-century Thomists. Examples of the second include attempts to reconcile Aquinas' philosophy of nature with modern physics, and his informal Aristotelian logic with quantified predicate calculus and possible world semantics.

The term 'Thomism' is sometimes used narrowly to refer to the thought of Aquinas, and to its interpretation and elaboration by sixteenth- and seventeenth-century commentators such as Cajetan, Sylvester of Ferrara, Domingo Bañez and John of St Thomas. At other times it is employed in connection with any view that takes its central ideas from Aquinas but which may depart from other of his doctrines, or which combines his ideas with those of other philosophers and philosophies. Prominent examples of Thomists in this wider sense include Francisco Suárez (1548- 1617) who also drew on the epistemology and metaphysics of another great medieval thinker Duns Scotus; and, more recently, Joseph Marechal (1878-1944) whose 'Transcendental Thomism' accepted as its starting point the Kantian assumption that experience is of phenomena and not of reality as it is in itself. An example drawn from the ranks of contemporary analytical philosophers is Peter Geach who draws in equal measure from Aquinas, Frege and Wittgenstein.

In the twentieth century there have been two major proponents of the philosophy of Aquinas, namely Jacques Maritain and Etienne Gilson, both of whom contributed significantly to the development of Neo-Thomism in North America. Interestingly, both men were French, neither had been trained in a Thomistic tradition and both were drawn into philosophy by attending lectures by Henri Bergson at the Collège de France in Paris. The Neo-Thomism they inspired declined following the Second Vatican Council (1962-5) as Catholics looked to other philosophical movements, including existentialism and phenomenology, or away from philosophy altogether. Today Thomists tend to be close followers and interpreters of the writings of Aquinas, but there is also a growing interest among mainstream English-language philosophers in some of his central ideas. While not a movement, this approach has been described as 'analytical' Thomism.

1 Aquinas and the first Thomism: 13th-15th centuries

Aquinas was born into a religious culture in which the dominant style of thought was a form of Neoplatonist Catholic theology. The main source of this was Augustine of Hippo, mediated via later Latin thinkers such as Anselm. Early in his life, however, Aquinas fell under the influence of the recently founded Dominican Order of which he became a member. Under the direction of Albert the Great, the foremost of the Order's early masters, he developed an intense interest in the more naturalistic philosophy of Aristotle whom he came to refer to as 'the philosopher'. Works of Aristotle were being translated into Latin for the first time during Aquinas' life, having been rediscovered through contact with the Arab world where they had been preserved.

To Albert and Aquinas, Aristotle offered a more promising resource for the articulation of Christian doctrine than

did the Augustinian Platonism current in the cathedral schools and universities. However this new synthesis met with considerable opposition since it seemed to be at odds with orthodoxy. In fact, Aquinas found himself in dispute with two groups. To one side were the Augustinians represented by the secular teachers and the Franciscans; to the other were extreme Aristotelian naturalists who held doctrines that are indeed difficult to reconcile with Christian orthodoxy. Aquinas sought to tread a middle path, directing writings against each group in turn: *De aeternitate mundi contra murmurantes* (On the eternity of the world) (1271) against Bonaventure and other Augustinian Franciscans, and *De unitate intellectus* (On the Unity of the Intellect) (1270) against Siger of Brabant and other Latin Averroists (named after Averroes (Ibn Rushd) the Arab philosopher and interpreter of Aristotle - see Averroism).

Although Aquinas' Christian Aristoteliansm was later to be judged the 'most perfect' reconciliation of philosophy and faith, and was made, in effect, the official system of thought of Roman Catholicism, it was initially attacked and subjected to ecclesiastical denunciation. In 1270 Bishop Tempier of Paris condemned a number of propositions associated with Aristotelianism. None directly attributable to Albert or Aquinas was included; but in 1277, three years after the death of Aquinas, Tempier issued a further condemnation and this time Thomistic claims (about the soul and the total nonmateriality of spiritual substances) were specified, although Aquinas was not named. In the same year Robert Kilwardby, Bishop of Oxford (and, like Aquinas, a Dominican) issued a similar condemnation; the following month the Pope endorsed Tempier's decree. Two years later William de la Mare, a Franciscan, produced a work 'correcting' the error of Aquinas' ways (*Correctorium fratris Thomae*).

The general Dominican response was to defend their master against these attacks from within and without. In 1278 the Dominican general chapter appointed a committee to investigate English Dominican disloyalty, and in the meantime set about promoting the cause of Thomas as a thinker and as a saint. In 1282 William of Macclesfield responded to de la Mare countering the charges with his *Correctorium corruptorii 'Quaestione'*. Around this time John of Paris responded similarly; by 1286 study of Aquinas was made compulsory by the Parisian Dominicans and this was repeated elsewhere: in Saragossa (1309) in London (1314) and in Bologna (1315). Defence gave way to counter-attack and on 18 July 1323, within fifty years of his death, Aquinas was declared a saint by Pope John XXII. Two years later Bishop Bourret of Paris revoked Tempier's condemnation.

Ecclesiastical approval removed one obstacle to acceptance of Thomistic thought, and by stages his ideas spread and gained influence. Apart from the intrinsic merit of those ideas, an important factor in this development was the increasing number of colleges and universities. Each approved place of study (*studium generale*) had houses belonging to the main teaching orders, and by this means, through the multiplication of copies of Thomistic texts and by translation into other languages (German and Greek), the Dominicans ensured that their master's voice could be heard throughout Europe.

Early in the fifteenth century Aquinas found a powerful follower in John Capreolus. In the late scholastic period, the ideas of Aquinas had to compete with those of two other medieval figures, namely Duns Scotus and William of Ockham. Capreolus challenged various views of Scotus and others to such good effect that he earned the title 'foremost Thomist' (*princeps Thomistarum*). More common than dialectical defences, however, were informed commentaries on the works of Aquinas, in particular the *Summa theologiae* (1266-73). These were important in transmitting Thomist doctrines, yet in themselves they did little to combat the rising tide of Ockhamist nominalism. Also, and somewhat unjustly, they were in part associated with the formalistic scholasticism against which the Renaissance humanists rebelled.

2 The Second Thomism: 16th-18th centuries

The sixteenth century was perhaps the most troubled in the history of post-medieval Christendom. The Reformation divided Europe into Catholic and Protestant states. It would be natural - but incorrect - to suppose that Aquinas was read only by Catholics. In England, the Anglican Richard Hooker, and in Holland the Calvinist Hugo Grotius were both influenced by studying his work. However, it was within Catholic countries and regions that the next phase of Thomism developed. In particular, Spain and Italy gave rise to new theologically and metaphysically oriented presentations of Thomas' thought. In England the Reformation was more a matter of politics than theology; elsewhere (including Scotland) the reformers drove their axe to the roots of Catholic belief. In response, the Church of Rome set about renewing its intellectual resources. Thus was born the Counter-Reformation.

The Council of Trent (1545-63) sought to systematize Catholic doctrine and led to the production of a definitive Catechism in 1566 (*Catechismus romanus*) on which the thought of Aquinas had a major influence. (Contrary to an often-repeated tale, however, the *Summa theologiae* was not placed on the altar alongside the Bible during meetings of the Council.) Trent encouraged the study of philosophy and theology in all Catholic colleges, seminaries and universities. This created a need for appropriate textbooks and that was met with a new style of manual setting out Thomistic thought. A further response to the reformers was the development of new religious orders. The most famous of these was the 'Jesuits', the Society of Jesus founded by Ignatius of Loyola. Ignatius explicitly encouraged the study of Aquinas and Aristotle, and expressed the hope that interpretations of their ideas adapted to the needs of the time would be forthcoming.

In saying this, Ignatius was drawing upon an earlier pre-Tridentine tradition of teaching and commenting on Aquinas. The major figures associated with this tradition were Dominicans. In the first decade of the sixteenth century Peter Crockaert, a Belgian working in Paris, had substituted the *Summa theologiae* for the *Sentences* of Peter Lombard which had previously been the standard text for theological instruction. Likewise in Italy Thomas de Vio Cajetan was lecturing on the *Summa* and producing a major commentary which was later to be published in an edition of the complete works of Aquinas. In Spain Francisco de Vitoria also used the *Summa* as a basis of theological education and he was followed in this by his disciple Domingo de Soto.

Early Jesuit Thomists included students of de Soto. But the full Jesuit appropriation of Aquinas came later with Luis de Molina and, most notably of all, with Francisco Suárez. The latter's great work was the 1597 *Disputationes Metaphysicae (Metaphysical Disputations)*. Starting from a recognized need to produce theology adequate to meet that of the reformers, Suárez came to the conclusion that it was not appropriate simply to invoke the philosophy of Aristotle; rather fundamental issues needed to be addressed afresh. The result was a mix of Thomistic and non-Thomistic (largely Scotist) metaphysics. In fact, Suárez anticipates much of the thinking about essence, existence, identity and modality that emerged as a result of the equally focused attention in a century of analytical metaphysicians.

The Dominicans meanwhile had stayed closer to the detail of Aquinas' philosophy, in part because they were still operating with the idea that their first duty was one of loyalty to a brother who had long been misrepresented and maligned. The need to evangelize and to educate added to the tradition of exact commentary a series of course-book texts, the most famous of which (still in use in Catholic institutions into the twentieth century) were the philosophical and theological courses (*Cursus philosophicus* and *Cursus theologicus*) of Jean Poinsot, better known as John of St Thomas.

In 1568 Aquinas was named a 'Doctor of the Church'. Taken from the Latin for teacher (*docens*), the first official use of the title occurred in the thirteenth century when eight saints (including Augustine) were so honoured. It is a measure of the Church's estimate that Aquinas was named its ninth *docens*, known honorifically as the 'Angelic Doctor'.

The sixteenth century ended with two main schools of Thomism. The first had its strongest base in Italy and was associated with Dominican exegetical interpretation. The second was rooted in Spain and centred around the Jesuit appropriation of Aquinas. The first was more narrowly Thomist, being closer to the historical doctrines of St Thomas, and found its natural expression in the form of close textual commentaries. The second was more broadly Thomistic and gave rise to treatises on particular philosophical themes such as existence and essence.

Inevitably there was competition between these traditions; but the most heated conflict was not methodological or interpretative but doctrinal. This occurred from around 1590 to 1610, and continued intermittently thereafter. The subject was the nature of grace, free-will and divine foreknowledge. On the one side, the Jesuit Molina argued in his 1588 *Liberi arbitrii cum gratiae donis (A Reconciliation of Free Choice with the Gifts of Grace, Divine Foreknowledge, Providence, Predestination and Reprobation)* that God's total omniscience is compatible with human liberty, because the former includes 'middle knowledge' (*scientia media*) by which God knows what each person would freely do in every possible circumstance of choice, and distributes grace accordingly. In opposition to what is certainly not a position advanced or accepted by Aquinas, the Dominicans, of whom the most prominent was Dominic Bañez, contended that God knows who will be saved and who will be damned because he has distributed fully effective grace to some but not all. The Jesuits accused the Dominicans of embracing Calvinist

predestinarianism, while the Dominicans charged the Jesuits with Pelagianism (see Pelagianism; Predestination).

This 'heresy calling' led to papal attempts to tame the debate, if not to end it, although without much success. In the meantime the intellectual energies of Thomists had been largely distracted from the important task of developing the general system so as to take account of the rise of modern science and the new philosophies of rationalism and empiricism. The trial of Galileo and the replies to Descartes show the Thomists to have fallen behind the times. Indeed, so far as the intellectual aspect is concerned, it was their ill-preparedness to engage modern thought, rather than intrinsic weaknesses within Thomism, that led to the marginalization of the tradition in the seventeenth and eighteenth centuries.

The fate of Catholic Thomism in the eighteenth century was also a reflection of the general circumstance of the Church. As in the Reformation, the period featured many social and political disruptions and much ecclesiastical infighting. In 1772 the Jesuits were suppressed on the order of the Pope and, in the next decade, Catholicism itself was battered by the French Revolution and by the rise of secularism. The new political thinking was antitheocratic, anticlerical, broadly democratic and at best deistic, although often atheistic (see Deism). It is hardly surprising, therefore, that a system of thought born out of medieval Catholicism did not flourish in these circumstances. The Dominicans continued to produce critical editions of Aquinas' writings but it is doubtful whether they were read outside the Dominican order. Even in Rome ecclesiastics had lost interest in Thomism.

3 Neo-Thomism: 19th and 20th centuries

As in the past, however, a process of revitalisation led in due course to a renaissance. Following the period of the French Revolution, Catholic thought in France, Belgium and Italy tended to be divided between two movements: a quasi-fideistic movement that emphasized the centrality of faith and sought to deal with the threat from rationalism by side-stepping it; and a philosophical approach which maintained, along lines first suggested by Christian Neoplatonists, and later developed by Cartesians such as Malebranche, that the intellect directly intuits God in all its acts of knowledge. These two approaches came to be known as 'traditionalism' and 'ontologism'; their main proponents being Lammenais (1782-1854) and de Maistre (1752-1821), and Gioberti (1801-52) and Rosmini-Serbati, respectively.

Elsewhere in Italy (particularly in Naples) and in Spain, the Dominicans maintained their loyalty to Aquinas. The Italian Dominican Tommaso Zigliara (1833-93) found favour with Bishop Pecci of Perugia (later to become Pope Leo III), and in 1873 was appointed Regent of Studies in the Dominican College in Rome where he was joined by Alberto Lepidi (1838-1922). Both men were critical of the traditionalists and the ontologists; and through their writings, teachings and administration they did much to encourage members of their order in Italy and France to develop Neo-Thomistic responses to these movements, as well as to the empiricism and rationalism to which they had been reactions. The revival of Thomism was much encouraged by the papacy. In 1846 Pope Pius IX argued that reason and faith are compatible and that lapses into fideism and intellectual intuitionism are both to be avoided. Versions of traditionalism and ontologism were condemned in 1855 and 1866, respectively, and a return to the scholastic approaches was openly favoured.

An important figure in this revival was Joseph Kleutgen (1811-83) a German Jesuit. In a five-volume work entitled *Die Theologie der Vorzeit*, Kleutgen identified the weaknesses in Catholic intellectual responses to modern thought. He argued that only Aristotelian metaphysics could provide a sure foundation for Catholic theology. In a second work, *Die Philosophie der Vorzeit*, he expounded his own version of neo-Aristotelianism, rejecting the epistemological method of Descartes in favour of cognitive realism, attacking Cartesian mind-body dualism. Like Aquinas, Kleutgen and his colleagues, such as Matteo Liberatore (1810-92), affirmed the unity of the human person as a psychophysical substance. Also while upholding the epistemological primacy of experience they maintained the possibility of establishing, by abstract reflection, various necessary truths about reality - principally that it is the creation of God. Although the thought of Aquinas featured here, this movement was more generally a revival of scholasticism rather than of Thomism as such. In fact neither Kleutgen nor Liberatore were Thomists in the narrow sense.

In 1878 Gioacchino Pecci was elected pope and was crowned Leo XIII. He had long supported the revivalist movement, and the following year he published the famous encyclical *Aeterni Patris* in which Aquinas is commended as providing the surest intellectual foundation for, and articulation of Catholic doctrine. Kleutgen is

reputed to have contributed to the draft of the encyclical and certainly his scholastic stance was vindicated by it. Leo also appointed neo-scholastics to important posts in Rome. Once again, then, through the edict of a pope, Thomism became the orthodox system of thought for Roman Catholicism.

Neo-Thomism looked in two directions. On the one hand it was called into being to address contemporary philosophical issues; on the other hand it drew its inspiration from the distant past. These two orientations gave rise to two strands, one ‘problematic’ the other historical. An unquestionable beneficiary of the revival was the history of medieval philosophy. At the University of Louvain in Belgium, where once ontologism had been enthroned, a new school of scholastic scholarship developed to which important contributions were made by Cardinal Mercier (1851-1926), Maurice de Wulf (1867-1947) and Martin Grabmann (1875-1959).

The problematic strand was first developed in response to the challenges of empiricism and Kantian idealism. Traditional Thomism assumed that the mind was in direct engagement with reality through experience. According to Aquinas both perception and intellection involve the reception of the forms of external substances. After Descartes, Locke, Hume and Kant, however, this view seemed difficult to maintain - indeed some found it difficult even to make sense of. The new orthodoxy was that the starting point of all philosophy is consciousness and the appearances it offers. Somehow from this we need to argue to the existence of something independent - external reality. Like others awed by Kantianism, several Neo-Thomists maintained that no philosophy could be credible that did not accept the new starting point of immanent consciousness. Influenced by Maurice Blondel (1861-1947) and Pierre Rousselot (1878-1915), the philosopher Joseph Marechal (1878-1944), and the theologians Karl Rahner and Bernard Lonergan - all of whom, like Rousselot, were Jesuits - tried to show that it was possible to combine Kant’s critical philosophy with the transcendental realism and theism of Aquinas. The result, known as ‘Transcendental Thomism’, though widespread in its influence among theologians, was never taken very seriously by philosophers.

Another example of the attempt to synthesize Thomism with a modern philosophy is represented by the ‘Lublin school’ founded with the establishment (in 1946) of the Catholic University of Lublin in Poland, the only independent university during the period of the Soviet bloc. Here the sources were several: Thomism was represented by French interpreters; realist phenomenology was advocated by Roman Ingarden who had been a student of Husserl; and logic and philosophy of science in the technical style was favoured by the Lwów-Warsaw school (see Poland, philosophy in §3). The leading figures were Kamiński and Krąpiec. The most famous member of the school, however, was Karol Wojtyla (1920-) who drew on the value theory of Max Scheler, Husserlian phenomenology and the anthropology of Aquinas, to devise a form of Thomist personalism articulated in his work *The Acting Person*. Better known as John Paul II, Wojtyla was not the first, nor probably the last pope to favour Thomism. His time at Lublin was short, however, being promoted to the see of Cracow in 1958, and elected Pope in 1978. Other members of the movement moved on, were diverted into administration, or died (Kamiński in 1986). The Lublin school is now moribund (see Poland, philosophy in §4).

Two of the most important twentieth-century Neo-Thomists were French laymen, Jacques Maritain and Etienne Gilson. Both were critics of transcendental Thomism and both had enormous influence in North America as well as in Europe. Maritain was raised in a comfortable, politically liberal, Protestant family. Despairing of the materialism and secularism characteristic of Paris university and intellectual life, he and his wife made a suicide pact but revoked this after attending lectures by Henri Bergson. While Bergson’s ‘vitalist’ philosophy lifted their despair, it was not until they converted to Roman Catholicism in 1906, and thereafter discovered the philosophy of Aquinas, that the Maritains felt they had found a wholly adequate worldview combining humanism with transcendence.

Maritain lectured and published very widely in almost all areas of philosophy, and was a dominant influence in Catholic thought from the post-First World War period to the Second Vatican Council (1962-5). He approached the thought of Aquinas somewhat ahistorically rather than as medieval revivalist, and derived from it a realist metaphysics, epistemology and value theory. In his most important work of speculative philosophy, *The Degrees of Knowledge* (1959), he argues, following Aquinas and John of St Thomas, that concepts or ideas are principles of thought but not (save in reflection) the objects of cognition. Likewise, he insists that the natural order has an objective metaphysical structure of essential kinds and that these are the proper concern of science. His theory of value is likewise keyed to external realities, but value is seen as directed towards participation in the life of God.

In his social and political philosophy Maritain emphasized the irreducibility of community and of the common good. These notions featured prominently in Catholic social teaching throughout the twentieth century and Maritain is often looked to as a source of inspiration by followers of this tradition (see Maritain, J.).

Like Maritain, Gilson was taught by Bergson, but his own interests lay principally in the history of ideas, and in particular in the relationship between modern philosophy as represented by Descartes and pre-modern scholasticism. From 1921 he held several Parisian posts in medieval philosophy at the Sorbonne, the École Pratique des Hautes Études, and at the Collège de France. His influence on the Neo-Thomist revival was as much through his teaching and academic leadership as through his writings. He lectured in North America, and co-founded the Pontifical Institute of Medieval Studies in Toronto. This has been one of the major centres of medieval scholarship and has helped to shape the interpretation of Aquinas by insisting on the need to understand his ideas in their historical context.

Gilson deplored the subjective turn introduced by the modern doctrines of mental images and ideas. However, he believed that any attempt to invoke medieval thinking in opposition to modern philosophy must be mindful of the variety of views held during the Middle Ages and, even more importantly, of the fact that they were developed primarily in theological contexts. Whereas Maritain presented Thomism as if it were a set of timeless abstract ideas, Gilson distinguished between the teachings of Aquinas and those of late commentators who sometimes imported their own views or who sought to synthesize Thomism with approaches current in their own day. Similarly he argued that while Aquinas drew heavily on the work of Aristotle he often used Aristotelian notions for different purposes, generally to defend Christian theology, and added ideas of his own; the most important of these being the claim that God is necessary existence and the source of the existence of contingent being.

Gilson's contextualist approach has been most widely followed among the Catholic historians of the medieval period, but its indirect influence is also apparent in the philosophical account of reason as immanent within traditions of enquiry advanced by Alasdair MacIntyre. A convert, like so many other English-speaking Catholic philosophers (including Anscombe, Dummett and Geach), MacIntyre's understanding and use of Aquinas has been shaped not by a Thomistic education but by personal study and in response to the views of others. For some years he taught at the University of Notre Dame, Indiana, where the Medieval Institute and the Jacques Maritain Center each engage scholastic thought. The second of these has been directed by Ralph McInerny, one of the leading representatives of Neo-Thomism in North America. McInerny has published extensively on Aquinas, increasingly in a popularizing vein. He was also for many years editor of the *New Scholasticism* (now the *American Catholic Philosophical Quarterly*). Together with the *Modern Schoolman*, the *Thomist* and to a lesser extent the *Review of Metaphysics* (edited by another senior Neo-Thomist, Jude Dougherty of the Catholic University of America), this journal and its successor have been the main fora for the presentation of essays in neo-scholastic historical and problematic traditions.

4 Aquinas and Thomism: future prospects

Contemporary historical scholarship in Thomistic philosophy is of a high standard. In the Anglo-Saxon world this is a consequence of the particular efforts of Gilson and his followers in Toronto, Notre Dame and elsewhere. Aquinas and other medieval and scholastic figures have also benefited from a general rise of interest in the history of philosophy, and by no means are all who now study Christian medieval thought themselves Catholics or even theists. At the same time it is natural that those who avow a Christian worldview should look with intense interest at the work of the individual who is beyond question the greatest Christian philosopher-theologian.

Future trends are difficult to predict in any detail, but if there is a future, and if it resembles the past even in broad outline, then the tide of interest in the thought of Aquinas will rise and fall as before. To some extent this will reflect the intellectual condition of the Roman Catholic Church and that of the colleges, seminaries and universities established to serve it. As was noted, however, Aquinas and Thomism are not the preserve of Catholics only. Indeed, there is a growing interest among philosophers trained wholly or partly in analytical philosophy. Some younger writers, drawing on the example of the British philosophers Elizabeth Anscombe, Peter Geach and Anthony Kenny, are using Thomistic resources to deal with contemporary philosophical problems. Others in the English-speaking world have turned to Aquinas as an important figure in the history of philosophy to be studied as one might any other thinker from the past. This second (mainly US) group is represented principally by scholars trained at Cornell under Norman Kretzmann and at Notre Dame under Ralph McInerny. As throughout previous

centuries, interest in Aquinas will continue along two broad and connecting paths: one followed by those who wish to give an accurate representation of his thought; the other taken by those who wish to mine it as a source of interesting ideas.

Thoreau, Henry David (1817-62)

Thoreau was one of the founders of the new literature that emerged within the fledgling culture of the United States in the middle decades of the nineteenth century. He inherited an education in the classics and in the transcendentalism of his older friend and teacher Ralph Waldo Emerson. Thoreau forged a means of writing which was dedicated to recording particular events in all their transience but capable of rendering graphic the permanent laws of nature and conscience. His incorporation of both confidence and self-questioning into the texture of his writing forms the ground of his standpoint as an observer of human lives and other natural histories.

Thoreau's relation to philosophy goes beyond his inheritance from Plato, Kant, Emerson and Eastern thought. Above all, his quest for philosophy is evident in the ways his writing seeks its own foundations. It is in the act of writing that Thoreau locates the perspectives within which to give an account of the humanness of a life. His project is to report sincerely and unselfconsciously a life of passion and simplicity, using himself as a representative of basic human needs and projects. Influenced by Plato's Republic, *Thoreau gives an account of some basic human needs, such as food, shelter and society. But also, like Plato, he shows that the particular institutions by which human needs are met are very far from being necessary. Tracing the relationship between need and necessity is one of the primary goals of Thoreau's work.*

1 Thoreau's vocation

During two years spent at Walden Pond, a small lake near his birthplace of Concord, Massachusetts, Thoreau began the work that culminated in the book called *Walden* (1854). In that same period of time, he spent the night in jail, and this experience is the point of departure for his essay 'Resistance to Civil Government' (1849), better known under its later title 'Civil Disobedience'. Despite the efforts of scholars like Perry Miller to promote the accomplishment of Thoreau's fourteen-volume *Journal* (1906), it is for *Walden* and 'Civil Disobedience' that Thoreau is best known. As literature, *Walden* stands with the work of Melville, Dickinson and Whitman, and is one of the founding documents of the transcendentalist tradition in American philosophy.

Thoreau possessed unrivalled powers of observation, the desire for a life of independence, and a vocation as a writer that dominated his everyday existence. His powers of observation were devoted to providing an account of the natural and human events that occurred around him. He sought both to find the order in these events and to disrupt the received categories of perception, understanding and narration. Long before twentieth-century physics, he was questioning the standpoint of the observer of nature, as well as the standpoint of the observer of human affairs. He sought the laws by which we could calculate the path of the apparently irregular occurrences of observers, along with the regularities in their observations.

Thoreau's requirement that we seek solitude and independence was not a recommendation of total isolation. He focused on solitude as a condition in which human beings learn how to hear what there is to hear. He thought that the modern conditions of cities and societies place us generally in a false proximity to other human beings. This falseness makes it difficult to take any steps towards a more genuine closeness or communication. Withdrawing to a place like *Walden* is not the same as acquiring freedom from the false sense of companionship and society. Taking that step, however, is meant to be an acknowledgement of the difficulties involved in achieving the proper distance from human affairs. Physical distance and isolation were symbols for the kind of mental perspective he sought.

Thoreau's work shows the way he absorbed and re-worked his reading of classical philosophers, especially Plato. He was one of the first thinkers in the West to avail himself of Eastern works: the *Bhagavad Gītā* and the *Laws of Manu* figure pervasively in *Walden* (see Duty and virtue, Indian conceptions of). Thoreau does not distinguish greatly between Eastern and Western traditions; rather he is concerned to distinguish between 'easy reading' and what he calls the 'heroic books' (Thoreau [1854] 1963 ch. III: 75). The latter require our best efforts of reading, while the former suits the cheapness of contemporary literature and serves to dissipate its readers' faculties and to confirm their shallowness.

What Thoreau characterizes as 'heroic' is connected to what he sees as the need for an epistemology of human possibility. He offers us an investigation of the relation between the literary depiction of mental liberation and the

natural conditions of practical freedom. The ways in which we read, as much as the newspapers and novels that constitute the bulk of our reading, are indications of our habits of attention in every sphere of human practice. Thoreau finds the dominant characteristic of these various enterprises to be a self-dissipation that undermines our ability to concentrate our powers. Reading in a 'high sense' is a primary path on which we may recover our concentration and discernment. Reading thus becomes a way to discover the conditions under which we work and act.

2 Emerson and transcendentalism

Early in his life, Thoreau experienced the power of the work and capacity for friendship of Ralph Waldo Emerson. Paradoxically, it was Emerson's entry into life that enabled Thoreau to discover his originality. Thoreau's reputation as a thinker has suffered doubly from this situation: he is almost invariably regarded not only as a transcendentalist, but as one whose basic ideas were derived from Emerson. And Emerson's own writing is consistently characterized as lacking the rigour and methodical development of philosophical thought.

The transcendentalist movement took its name from Kant's notion of the transcendental employment of ideas. Rather than seeking to go beyond human experience, transcendental knowledge seeks the conditions under which our current human knowledge and the experience of ordinary objects is possible. Transcendentalists interpreted this Kantian problematic as requiring a reciprocal relation between the quality of daily experience and the possibility of achieving a knowledge of the conditions of that experience. Taking the state of mind in which a thing or event gets perceived to be as critical as our knowledge of the manner in which the thing or event is caused, transcendentalism combined an idealist vision of the world as created or coloured by the human spirit, with a Romantic characterization of human beings as losing interest in the world. This loss of interest is taken not merely as a mood but as an increasingly fundamental and characteristic relationship between the individual and the world. The sense of boredom and melancholy concerning the world was understood as affecting the very perception of the world. A renewal of interest in the world was regarded as necessary to the renewal both of knowledge and of the powers of creativity.

Thoreau's transcendentalism provides a critical piece of the background to his justification of resistance to unjust government. 'Civil Disobedience' is both a statement of principle and an account of the actions which led to his spending a night in jail for refusing to pay a poll tax. The work was intended as both an intellectual example and a moral provocation. Thoreau exhibits the connections of the call to conscience with his own call to a less economically dependent mode of life. As Plato's philosopher must go back into the cave, so Thoreau declares that some of his 'generative energy' must be devoted to abolishing the conditions that prevent other individuals from responding to fundamental human possibilities. His appeal to his fellow citizens to resist the tyrannies of slavery and imperialism are couched in terms that demonstrate his hopes for a national awakening and moral regeneration.

3 Cavell's reading of Thoreau

In *The Senses of Walden* (1972), the American philosopher Stanley Cavell depicts the unwillingness of readers to grant the powers of philosophy or consecutive thought to Thoreau's words. He characterizes this blankness towards Thoreau as an estrangement from a region of our own powers of thought. Cavell's project has spiralled back to a reconsideration of Emerson's work, and he propounds a vision of perfectionism in Thoreau and Emerson. This interpretation of a dimension of moral thought at least as old as Socrates' 'care of the soul' requires the shedding of false possibilities and false necessities. Only by giving up an apparent wholeness of the self can we take a step towards an integrity that is internal to the self's own constitution. Emerson and Thoreau thus stand at the core of a tradition of American thinking that has been neglected and even suppressed.

In characterizing our distance from Thoreau's writing as a form of distance from our own capacities for self-reflection, Cavell's work provides the grounds for considering Thoreau's relation to philosophy. Among the central claims of Cavell's investigation are these: (1) Thoreau's penetration of the world is made possible by his acceptance of our necessities and by the capacity to convert necessity into forms of habitation. Specifically, (2) human labour is not only one of the necessities of our lives but one of the forms in which we make contact with the necessities of the world. All forms of labour are thus expressive of one another, not only in the debased terms of economic value but as different modes of knowledge and of contact with reality (see Work, philosophy of). (3) Cavell locates in *Walden* the apparent paradox according to which we must let a book provide the terms that teach

us how to read the book. The immediate methodological step is that we are to relinquish our inherited images and ways of reading. (4) Cavell discerns in Thoreau the intention to compose a nation's scripture, overturning not only personal deadness to our words but a national faithlessness to its founding vision. (5) There is a corresponding project to redeem the economic terms of value and expression, and this project in turn releases a more humanly adequate conception of labour and value. (6) Cavell discovers in Thoreau a quasi-Kantian vision of the necessities of life in nature as creating the medium within which a life of freedom is found to be liveable. Thoreau's task is not so much to learn independence by living in the woods as to find out what could make his life in the woods a form of independence. From the beginning of his sojourn there, he demonstrates his awareness that he must be prepared to leave it.

4 Thoreau as inheritor of philosophy

Thoreau's work often invokes the figure of the philosopher, as when he writes that 'To a philosopher all news, as it is called, is gossip' (Thoreau [1854] 1963 ch. II: 70). Thoreau thought of newspapers as purveying what was essentially gossip, and urged philosophers to find ways of getting beyond the superficial claims of merely current events. At the same time, Thoreau characterizes gossip as one of the primary modes in which the members of modern society communicate messages to each other. What makes it gossip is not the content of what is said but the uprooted disposition of the speakers from the ground of their real concern. Thoreau understood gossip as disguising the sources of our concern and the unsettled quality of our communications.

The sense of the social as precisely constituted by a certain kind of talk is most immediately related to Emerson's depiction of the whole 'cry of voices' standing against the solitary voice of the self-reliant. Thoreau's sense of social communication also bears comparison to the fifth chapter of J.S. Mill's *On Liberty* and to the places in *Being and Time* where Heidegger attempts to specify the conditions of 'mere talk' (*Gerede*) as constitutive of our being with one another. The degeneracy of our talk and speech is linked by Thoreau ([1854] 1963 ch. XIII: 186) to the distance between our 'parlours', or places of speech, and the 'kitchens' where our the object of our needs are most immediately transformed into the possibility of satisfaction. The proximity of human words to the concerns from which the words arise is part of the accomplishment of the truer speech and deeper knowledge which is the province of the humanities.

Thoreau sees his own capacity for vision as deriving from the same sources as other philosophers, in other places and other epochs. He explicitly mentions sharing certain perceptions with the 'oldest Egyptian or Hindoo philosopher' ([1854] 1963 ch. III: 74). This mingling of identities in our capacity to apprehend our condition is not mystical. It is a precise declaration of the impersonality of that part of the mind which is capable of spectatorship and criticism. He declares his sense that:

> To be a philosopher is not just to have subtle thoughts but so to love wisdom as to live according to its dictates, a life of simplicity, magnanimity, and trust. It is to solve some of the problems of life, not only theoretically, but practically.
>
> (Thoreau [1854] 1963 ch. I: 10)

Many readers have taken such remarks to imply that Thoreau is exhorting us to bring our lives into accord not only with simplicity but with a relatively simple doctrine of life. Richardson's 1986 biography simply omits the word 'just', as if to insist that a philosopher should dispense with subtle thoughts. Thoreau associates philosophy with its classical task of searching out and heeding the dictates of a practical wisdom. This association is a valuable clue to Thoreau's conception of a philosophical life. Thoreau's search for what he called the writer's 'equable life' is also a search for the 'occasions' of writing ([1854] 1963 ch. III: 76). These occasions provide simultaneously a chance for immediate perception and a chance to secure the vantage points of his observations. The reader must remember that the search for these occasions of simplicity is not itself very simple. Thoreau scrupulously records the failures as well as the successes in his search for the conditions of writing and observation. In these moments of reflection and self-criticism, we find Thoreau's deepest engagements with the issues of philosophy. One train of Thoreau's thought about simplicity leads to the analogy that:

> Our life is like a German confederacy, made up of petty states, with its boundary forever fluctuating, so that even a German cannot tell you how it is bounded at any moment.
>
> (Thoreau [1854] 1963 ch. II: 68)

The object of this little gibe is the effort of post-Kantian German philosophers to chart in systematic prose the limits of the mind and the limits of its freedom. As *Walden* unfolds, we learn that 'simplicity' is only one face of the answer. Simplicity is as little or as much of a solution to the problem of the soul as it is in Plato's *Phaedo*. It is the smallness as well as the transience of the states composing our minds that Thoreau wants us to overcome.

Thoreau depicts the fluctuation of the boundaries of our life as containing a philosophically positive possibility. In the conclusion of *Walden* he speaks of passing beyond an 'invisible boundary'. He goes on to say that 'in view of the future or possible' we should learn to live 'quite laxly and undefined in front' ([1854] 1963 ch. XVIII: 245). He was not content to arrive at a simple life, if that meant establishing rigid defences against the complications of society. He also suggested that the transformations of an individual's development could not be bounded by a single experience, or a single theory of such an experience. The primary example in his culture was the Christian experience of conversion and its role in the doctrine of atonement.

Thoreau's reflections on language attempt to characterize the volatile presence of words at the core of all experience. The transience of our spoken words is analogous to the disappearance of significance from a written text. Both can be instructive to those who know how to listen and to read. An appropriate mode of reading points inwards to the possibility of locating our freedom in a world of natural law. For Thoreau the act of reading thus takes on some of the functions of judgment in Kant's *Critique of Aesthetic Judgment*. As judgments of the beautiful are meant to apprise us of 'traces' of harmony between nature and the functioning of our practical reason, so the act of reading teaches us how to understand and to appropriate what is rightfully ours. For Thoreau, reading is the path on which we learn to conceive the connection between the accidents of nature and the necessities of human freedom.

Thought experiments

Thought experiments are strange: they have the power to present surprising results and can profoundly change the way we view the world, all without requiring us to examine the world in the way that ordinary scientific experiments do. Philosophers who view all hypothetical reasoning as a form of thought experimentation regard the method as being as old as philosophy itself. Others maintain that truly informative thought experiments are found only in mathematics and the natural sciences. These emerged in the seventeenth century when the new experimental science of Bacon, Boyle, Galileo, Newton and others forced a distinction between the passive observation of Aristotelian mental narratives and the active interventions of real-world experiment. The new science gave rise to a philosophical puzzle: how can mere thought be so informative about the world? Rationalists argue that thought experiments are exercises in which thought apprehends laws of nature and mathematical truths directly. Empiricists argue that thought experiments are not exercises of 'mere thought' because they actually rely upon hidden empirical information - otherwise they would not count as experiments at all. More recently it has been argued that thought experiments are not mysterious because they are constructed arguments that are embedded in the world so as to combine logical and conceptual analysis with relevant features of the world.

1 Features of thought experiments

As literary entities, thought experiments are more accessible, repeatable and persuasive than any real-world experiment. Thought experiments have other features, which we illustrate with an experiment by Simon Stevin. This shows that the force needed to balance a ball on an inclined plane varies inversely with the length of the plane. We know that a ball on a smooth horizontal plane is supported by the plane: no force is needed to keep it stationary. A ball against a vertical plane is not supported by the plane at all, so a force equal and opposite to its weight is needed to keep it stationary. What force is needed for the intermediate cases where the plane is inclined?

Can this question be answered just by thinking? First imagine a triangular prism positioned with its base horizontal some distance above a table. Now imagine a necklace consisting of fourteen identical, perfectly spherical-balls draped over the prism so that four rest on the left-hand longer incline and two rest on the shorter incline. The remainder of the chain forms a loop below the prism. The balls are connected at equal distances in a way that allows them to roll freely. Will the necklace move? To imagine that it moves is to suppose that perpetual motion is possible. Observe, instead, that the necklace is in equilibrium. The third step in the experiment is to imagine cutting the necklace simultaneously at two points just beneath the prism (or more easily, perhaps, at a single point where it is closest to the table). What happens to the six balls remaining on the prism? Our knowledge of this situation suggests that they will remain in equilibrium: four balls on the left balance the two on the steeper incline on the right. This is an imaginary result. But we do not need to make a real experiment because to suppose any other outcome is to deny one or more conditions of the experiment. Now the length of each plane is given by the number of balls resting on it (here, $4:2$), so the force needed to balance any ball varies inversely with the length of the plane.

This illustrates nine features shared by most thought experiments in science and by many in philosophy:

(i) Method of abstraction: the experiment presupposes a method (determine the limiting cases (force = 0, force = weight of the ball)) then constructs an idealized intermediate case in which only two outcomes are possible.
(ii) There is a situated procedure: this is conveyed as a narrative describing a sequence of operations on simple objects, which takes place in an idealized situation (Stevin's set-up is frictionless).
(iii) Causality is important: operations are connected to outcomes by causal principles and causality is governed by simple principles such as symmetry or conservation.
(iv) Intervention is important but unproblematic: the reader/observer is involved, but is perfectly competent (the cuts in the necklace must be made perfectly simultaneously, so they are).
(v) Interpretation is constrained: the scenario is interpreted according to agreed principles (impossibility of perpetual motion).
(vi) Results are unambiguous and are usually limited to just two possibilities (the balls move, or they do not). Binary outcomes are a feature through which thought experiments expose the tension between two disparate ways of thinking about the situation.
(vii) Implications are clear: the meaning of the result is unequivocal (lack of motion implies the proportionality

described above). We describe other examples below in which thought experiments generate a paradox or contradiction whose resolution requires a profound change of view.
(viii) Implications are compelling: however surprising the resolution may be, the intellectual experience engendered by a thought experiment is compelling; whether the experiment could be performed in the world seems as irrelevant as whether the story-line of a good joke is actually true.
(ix) Thus, a thought experiment always works and is easy to replicate. In this respect it differs from real experiments (excepting text-book idealizations).

A thought experiment is an idealization which transcends the particularity and the accidents of worldly human activities in order to achieve the generality and rigour of a demonstrative procedure. We argue in §4 that this effectiveness owes as much to knowledge brought to bear by a reader of the narrative as it does to the ingenuity and knowledge of the experimentalist who authored it. We note in §3 that thought experiments in philosophy are typically less constrained by situational knowledge and are open to counter-interpretation; that is, they may lack features (ii), (iii) and (v) and, therefore, (vii) as well.

2 Thought experiments in science

In Aristotelian and medieval science the narration of an experiment usually supplanted actual performance. The new experimental narratives of Francis Bacon, Boyle, Galileo Galilei, and Newton discredited these speculative narratives. By the end of the seventeenth century actual performance was necessary to establish a fact. Yet thought experiments are advanced as fictions. How could they assume such an important role in the new science? A Platonist explanation advanced by Koyré is that thought experiments became central to science because they use idealizations necessary for mathematical descriptions of nature. Since nature is ultimately a rational mathematical system it is to be expected that such experiments deliver truths about reality. They work because they appeal directly to intuitive knowledge rather than empirical experience. Philosophers go on to argue that the informativeness of thought experiments is evidence for the Platonist view that human knowledge is of transcendent realities. Einstein, a master of thought experiments, is often enlisted in support of this rationalist view.

The power of thought experiments as seemingly independent of publicly repeatable observations led a few empiricist philosophers, such as Pierre Duhem (1954) and Carl Hempel (1965), to deny that they constitute a legitimate method of scientific investigation: at best they have an heuristic role as guides to discovery. Another empiricist interpretation is that all thought experiments are deductive arguments whose empirical content is hidden as suppressed premises. In a response to Koyré’s Platonist interpretation, Kuhn (1964) argued that thought experiments can work effectively only in simulated worlds to which experimenters successfully apply their own real-world knowledge and experience. We develop this important insight further in §4. It is true that most thought experiments can be reconstructed as deductions; however, this does not show that thought experimentation is deductive. Some philosophers argue that the content of an idealization may be greater than can be expressed by a set of propositions. Thought experiments are narratives from which readers construct non-propositional mental models. The persuasiveness of such experiments does not necessarily depend on logical structure. Logic is only used afterwards, to validate conclusions reached by thinking with models.

The view that thought experiments are no more than deductions can be refuted by an example, one of Galileo’s best-known objections to the Aristotelian doctrine of motion applied to falling bodies. According to Aristotle (and to untutored common sense) heavy bodies fall more quickly than light ones. Imagine that two stones, L and H, are falling. Grant the common-sense belief that H falls more quickly than L. Now imagine that H becomes attached to L. Since light objects fall more slowly, L will retard the fall of H. Yet $L + H$ weigh more than H, so the conjoined stones must fall more quickly than H. This experiment displays all the features listed in §1. There is a narrative in which a sequence of events and interventions can cause two contradictory outcomes. The experimenter must choose. In a truly efficacious thought experiment the procedures cannot be faulted (as they routinely are in real experiments). A contradiction or paradox therefore exposes a fallacious assumption rather than incompetent practices. Here the only candidate is the postulate that velocity is proportional to weight. The problem is resolved if velocity is not affected by weight:

$$V_H = V_L = V_{H+L}\ .$$

This means that the accelerative force is the only relevant factor. Galileo’s narrative sequence may be

reconstructed as a deductive argument. However the crucial move - assenting to the proposition that ' $V_H = V_L = V_{H+L}$ ' - cannot be *deduced* from what has gone before. It is an insight, a new way of perceiving the whole sequence of events which also creates new experimental possibilities.

After a crucial insight has been accepted, another kind of thought experiment is possible, in which material impediments such as air resistance are removed (see Idealizations). These idealizations sometimes become real experiments as technology develops. Consider an imaginary experiment in Newton's *System of the World* in which the altitude of the point from which a cannon ball is fired becomes higher and higher so that the projectile eventually goes into orbit. Incremental steps take us from plausible, familiar circumstances and consequences to one that is impossible and implausible. Newton's purpose was to demonstrate the counter-intuitive proposition that the force that pulls a projectile back to the ground is the same force that holds the moon in orbit. Here conceivability suggests the physical possibility of artificial satellites. Viewed as a deductive argument, it presents directly the impossible consequence of applying the laws of gravitational and centripetal force to projectiles. We can reconstruct this as a deductive argument, but as a self-contained argument this is no longer an experiment.

3 Thought experiments in philosophy

Thought experiments are used widely in philosophy. Some philosophers define thought experiments to include any argument that invokes a hypothetical situation (as, for example, moral dilemmas raised by a pressing need to choose between two equally unjustifiable actions). Others hold that such arguments only appear to be experiments. Plato argued Socrates' thesis that all knowledge is recollection by means of a thought experiment in the *Meno* in which Socrates responds to a dilemma about inquiry (see Plato §11). Someone posing a question either knows the answer (so has no need to ask) or has no knowledge of the answer (so would not recognize the answer). The questioning is therefore pointless. Meno's uneducated slave boy is asked to construct a square double the size of a given square. Does his success prove that the boy remembers mathematical knowledge that he had not realized that he possessed? Not necessarily. An alternative interpretation is that in the course of eliciting an answer, Socrates' questioning educates the boy, enabling him to solve the problem. This illustrates the point made in §1 that scientific thought experiments are less open to interpretation than are philosophical ones.

Some philosophical experiments are imaginary excursions into intriguing but impossible worlds. Hobbes' refutation of the immateriality of mind involves imagining oneself shrinking until one can wander amongst the smallest corpuscular components of the brain. Could such an observer see thoughts? Not if thoughts are due to the interactions of corpuscles. The experiment works by diverting our attention from the fact that to enter this corpuscular world is to assent implicitly to a materialist metaphysics. One can always deny the presumption on which the possibility of making the experiment depends. If, for example, we re-interpret Plato's narrative about Meno's slave as an example of instruction, then it ceases to be a demonstration that knowledge is the recollection of eternal, transcendent truths. Because of this interpretive flexibility about central features of the narrative, philosophical thought experiments are rarely as decisive as their scientific counterparts.

The argument of Searle's Chinese Room experiment is that semantic meaning is not reducible to physical symbol-manipulation. This develops a version of Turing's behavioural test of the indistinguishability of the linguistic competence of machines and humans. Searle aims to undermine Turing's criterion of equivalence by granting to a Chinese-speaking room the capacity to do whatever is necessary to pass Turing's test (that is, solve arithmetical problems, converse about preferences, tell jokes and so on). The experiment involves examining the inner workings, especially the procedures whereby an operator inside applies rules of syntax to interpret and respond to questions. Since the operator can do this without understanding any Chinese pictogram, Searle concludes that symbol manipulation does not involve semantic understanding of this or any other language (see Chinese room argument). Are Hobbes and Searle describing experiments? Or do their narratives have only the appearance of being experimental? These exercises expound the consequences of a metaphysical position. It is difficult to see that they test it in the way that Galileo's experiment (see §2) tests Aristotle's theory of motion.

4 Further issues

A thought experiment constructed by an ill-informed experimenter may persuade, but it will also mislead if it is not constrained in the way that thought experiments in mathematics and physics are. This is why similarities between armchair experiments and scientific ones should not be pressed too far. The constraints are illustrated by

an armchair refutation of Einstein's principle that no signal can travel faster than light. Imagine that a rigid rod is extended upwards from the surface of the rotating earth. The velocity of its tip will eventually exceed the speed of light. However this logical necessity has no physical relevance. Physicists deny the possibility of such an experiment, pointing to the fact that, as material from the earth is used to extend the rod, the velocity of rotation must decrease. The experiment indicates ignorance of the relevant physical laws. A further example illustrates the importance of knowing how to apply such knowledge consistently. What happens to a very small hole bored through a large metal ring when the latter is heated: does the hole get larger or smaller? A would-be experimenter needs to know both that heating causes expansion and how to apply this fact to the ring. What is needed is a combination of empirical knowledge and the ability to reason with it. This fact opens the way for an answer to our opening question about the informativeness of imaginary experiments.

Can the mysterious efficacy of thought experiments be explained? We approach this by addressing two further questions:

(1) What distinguishes this kind of mental activity as experimentation rather than hypothetical reasoning? If a thought experiment is a purely mental affair then it cannot be an experiment at all. If it is not a purely mental affair then there is no paradox. Naturalism argues that personal participation - represented by items (ii)-(iv) in §1 - is what makes a thought experiment more than a hypothetical argument. (This is why we perform experiments but do not 'perform' an argument). A thought experiment is effective if it is both logically well-formed and empirically informed about relevant features of the world it purports to investigate. It expresses the minimum set of conditions necessary to sustain the appearance of an argument of some generality, whilst giving the appearance of the situated-ness that real experiments actually have.

(2) Does an informed thought experiment express tacit knowledge or intuitively apprehended principles? Empiricists have argued that thought experiments articulate and apply intuitions formed from human experience. Ernst Mach appealed to Darwin's principle of natural selection to guarantee that these intuitions adequately represent the world: natural selection favours those minds which successfully imitate causal patterns in nature. This explanation embeds experiment in the world but it does not go far enough. Naturalistic explanations emphasize cognitive capacities and culturally transmitted knowledge (see Naturalized philosophy of science). Such capacities and knowledge enable abstraction. The degree of abstraction possible in a thought experiment depends on how much both its author and its readers have participated in the culture of the experiment. In this respect thought experiments have much in common with jokes. Both are sparse, carefully crafted, narratives which include only essential details. There is a punch-line requiring an insight which changes our understanding of the story. In both cases we see the point without its being articulated as an argument. Yet philosophers do not appeal to intuition or sense experience to explain how people understand jokes. Thought experiments are powerful because they appeal to lived experience of a world which their narratives reflect, selectively, back at us.

Thrasymachus (late 5th century BC)

Thrasymachus, a Greek Sophist and orator, is known principally for his role in book 1 of Plato's Republic, in which he argues that justice is simply a social institution created by rulers to further their own interests. It is intended solely for the subjects; the rulers themselves need not practise it. Since justice thus consists in promoting another's advantage rather than one's own, injustice is far more profitable. Apart from issues of internal coherence, his claims raise many questions. What, for example, are our true interests? And what are the actual and ideal operations of power?

Very little is known of Thrasymachus' life. He was a teacher of rhetoric, of an apparently aggressive disposition, although Plato's portrait may be distorted by anti-Sophistic bias (see Sophists). In the *Republic* (see Plato §14) he makes two main speeches, and it is debated whether their claims are compatible. In the first he declares that what we call justice is simply the interest of the stronger: in every city the stronger wield political power and make the laws in their own interest, calling obedience to these laws 'justice'. Whether the government is tyrannical, aristocratic or democratic, the institution of justice is merely a cover for *force majeure*. This legalistic conception of justice, however, is modified when Thrasymachus adds that obedience to the laws will only constitute justice when the laws really are in the interests of the rulers, since the rulers may be mistaken about where their advantage lies.

In his second speech Thrasymachus extends the discussion to include private as well as political relations. What we term injustice is simply the pursuit of self-interest, and pays the individual far better than justice. He boldly suggests that injustice is positively a virtue (*aretē*), the virtue of common sense. The unjust are prudent and admirable; the just are naïve fools. Indeed, we partially admit this: although we criticize and punish petty wrongdoers, when injustice is practised on a sufficiently grand scale by, say, a tyrant, we merely call the tyrant fortunate. We would all be tyrants if we could.

These two positions may appear at odds. If justice is simply the interest of the stronger, then surely the tyrant who supremely promotes his self-interest is supremely just? Yet Thrasymachus clearly states that the tyrant is supremely *un*just. Some have argued that he is operating with two notions of justice, conventional and natural (see Callicles), but a simpler reading suggests that a conventional description is retained throughout. Injustice is ruthlessly promoting your own desires at the expense of others; justice is giving others their due. In theory each can be practised by both rulers and ruled (as Thrasymachus admits in his second speech); in practice, however, opportunities for injustice will chiefly be available to the rulers, whereas the ruled will generally have to accept the imposition of justice. The initial statement that justice is the interest of the stronger is therefore not to be taken as a complete definition, but as a description of how justice operates in the world of *realpolitik*.

Thrasymachus does, however, complicate his position by admitting that the practice of injustice may sometimes be an unsuccessful means of satisfying one's desires (one may get caught and imprisoned), and this leaves open the possibility that in some circumstances justice would be the more prudent course of action. His implicit ideal is the person who successfully promotes their own interests. This will often involve acting unjustly, but not necessarily always - a key consideration will be one's political status. Underlying the ideal is a notion of human flourishing seen in terms of material wealth, autonomy and power.

Thrasymachus' position thus goes deeper than its superficial cynicism might suggest. But does his ideal carry with it any notion of moral obligation? The answer depends on how one interprets (1) his use of the word 'virtue', and (2) his claim that everything normally predicated of justice should in fact be predicated of injustice. Whether he is prescribing or simply commending his ideal, however, the practical implications remain unclear. If the rulers fare so much better than the ruled, is he advocating that the ruled seize power? Or that they embark on a programme of mass disobedience? Or is he just recommending opportunism? Whatever the answer, it is plain that his doctrines could be used to endorse all these possibilities, plus tyranny and imperialism, as Thucydides shows. It is because of this that Plato takes his challenge so seriously in the *Republic*.

It is also debated whether Thrasymachus actually endorses the doctrines he voices. The ambiguous tone of his responses to Socrates precludes certainty, but it is possible (and may be supported by a separate fragment) that his

attitude is that of the embittered and disillusioned moralist, ironically praising injustice because justice no longer pays. His intention may be simply to expose current hypocrisies, rather than to applaud their manipulation.

Thucydides (*fl. c.*400 BC)

A Greek historian with philosophical interests, Thucydides wrote about the Peloponnesian War between Athens and Sparta (431-404 BC). He elaborates on the decisions of war in brilliantly reconstructed debates and speeches, reflecting his training under various Sophists. Many of these speeches take for granted that people care less for justice than for their own narrow interests. This dark view of human nature influenced Hobbes, while the style of the debates and speeches has had an enduring effect on public rhetoric. His account of Athenian democracy in action is cautionary, and his conservative political views anticipated Aristotle's in some respects.

A wealthy Athenian, Thucydides served as general in 424 BC, but failed to prevent the Spartan capture of an important outpost and was punished by exile. He did not return to Athens until after its defeat in 404. Beginning work on his *History of the Peloponnesian War* during this exile, he brought his account up to the year 411, at which point it breaks off. The dates of his birth and death are not known, but it is likely that he was born between 460 and 455 and died early in the fourth century BC. He is said to have studied with the sophist Antiphon and the natural philosopher Anaxagoras, and it seems likely that he also learned style and argument from other Sophists such as Protagoras (see Sophists). His *History* is unusual in that nearly one fourth of the text consists of speeches and debates. These are all composed in Thucydides' style and display methods of argument taught by Sophists. Pericles' funeral oration is especially well known, with its reflections on the culture and constitution of Athens. Thucydides states his own views sparingly, 'having', as Hobbes puts it, 'so clearly set before men's eyes the ways and events of good and evil counsels, that the narration itself doth secretly instruct the reader' (Schlatter 1975: 18).

On human motivation, Thucydides' views are no secret. Fear, ambition and avarice dominate his explanations of events. Expansion of the Athenian empire is due to these factors; this expansion put fear into the Spartans which drove them to start the war. Thucydides' description of the plague at Athens in 430 BC shows how badly he believes people behave when they no longer have any reason to fear the laws. He sounds a similar theme in his account of a civil war on the island of Corcyra between the parties of 'the many' and the 'few', that is, the democrats and the oligarchs. These combatants were led by avarice and ambition to commit violent acts that they justified by a reversal in their use of moral language; the results included all sorts of betrayal, revenge and the slaughter of prisoners. Human nature, Thucydides believed, will overcome the effects of law whenever a breakdown of authority gives it the opportunity.

The same principle is at work in international affairs. Neither Athens nor Sparta considers justice when deciding how to treat its neighbour states. When the Athenians decide not to slaughter the people of Mytilene, whose rebellion they have just put down, they do so from a calculation of their own advantage. Justice, the Athenians believe, is relevant only when both parties are equally subject to authority. The Athenians do in each case what they deem necessary for the survival of their empire, and go so far as to conquer the harmless island of Melos and execute its male population for this reason. Although Sparta claims to support justice, it too destroys a city and its people out of self-interest.

Thucydides' dark view of human nature explains the value he places on maintaining a stable system of law and fending off radical democracy, which, in his view, leads to lawlessness. Thucydides praises Pericles for ruling like a monarch in Athens when it was a democracy 'in name only'. Much later, when Athens blundered into war with Syracuse, it was defeated by the conservative leadership of Hermocrates, which Thucydides contrasts with the foolish partisanship of the democrat Athenagoras. Conservative democracy was the strength of Syracuse, but democracy after Pericles did not serve Athens well. The best sort of constitution, according to Thucydides, is neither democracy nor oligarchy but 'a moderate blending of the interests of the few and many', in which neither party is allowed to make gains at the expense of the other.

The methods of argument displayed in the *History* are as important as the views expressed. Historiographers are interested in the manner in which Thucydides constructs an account of prehistoric Greece using myth, poetry, archaeology, local traditions and analogies with primitive peoples of his own time. Here and in the speeches he makes use of a type of inference known as *eikos* ('probable' or 'reasonable expectation'). Thucydides' speakers often argue in favour of actions they believe it is necessary (*anankē*) for them to take in view of the outcome they think it is reasonable to expect (*eikos*). Such a speaker is frequently contradicted either by the outcome (which is

often unexpected) or by another speaker making an equally powerful argument for the other side. Reasoning on such matters is what philosophers now call *defeasible*; it holds only for normal conditions and is defeated by unexpected abnormalities. Alcibiades, for example, predicts that when the Athenian army reaches Syracuse the people there will be divided, owing to their complex cultural heritage, and so more easily defeated. Such a strategy worked for Athens in cities where civil war was the norm. Syracuse, however, was exceptionally stable owing to the conservative leadership of its democracy; the city did not divide and it was not conquered. Unusual circumstances defeat arguments based on reasonable expectations, and this pattern is illustrated throughout the *History*. Thucydides' opposed pairs of speeches, as well as his frequent oppositions of speech and event, illustrate not only his theory of motivation but also kinds of reasoning, good and bad, that were current in the teaching of the sophists.

Ti and yong

Ti *and* yong *(literally 'body' or 'substance' and 'use' or 'function') are technical terms in Chinese philosophy.* Ti *often is used to denote the essence or fundamental nature of a given thing, for example, 'the substance/true essence of the Way'. As a verb, it can also mean to 'embody' or 'instantiate' a given characteristic or virtue, for example 'to embody/fully realize humanity'. A thing's* yong *is its characteristic activity in accordance with its nature.*

Neo-Confucians made extensive use of the idea that the universe was - like the parts of a single individual - 'one body'. Those who realize this, both in the sense of cognitively assenting to this proposition as true as well as appreciating its moral implications, will feel an injury to another (in some cases even to inanimate objects) as an injury to their own bodies. The notion of 'one body' was also used in a related but distinct sense to describe phenomena which, while logically distinguishable, cannot actually exist apart from one another: in Chapter 15 of the *Platform Sutra*, a lighted lamp and its light are said to be 'one body' (see Platform Sutra). This recalls Aristotle's distinction between phenomena which are by definition distinct but by nature inseparable, such as concave and convex in the circumference of a circle.

The first occurrence of *ti* and *yong* as a conceptual pair occurs in Wang Bi's commentary on the thirty-eighth chapter of the *Daodejing*, where he uses it to discuss the *ti* (essence) of things and their *yong* (characteristic functions). Here, and in other passages, the *yong* of a thing is not simply what a given thing happens to be doing; there is a normative aspect to the notion. It is thus not wholly unlike Aristotle's use of the term *ergon* (see Aristotle §22). It is what that thing will do according to its particular *ti* (essence) when allowed to operate freely in an environment conducive to its natural functioning. Thus, in the passage from the *Platform Sutra* quoted above, the *yong* of a lighted lamp is to emit light; or as Chen Chun says, 'That which is one whole within is the substance; its response when stimulated is the function' (Graham 1992: 40).

The pair *ti* and *yong* are used extensively by neo-Confucian thinkers in the normative sense mentioned above. Thus, in his commentary on *Analects* 1.2, Zhu Xi says, 'Humanity is human nature, filial piety and brotherly respect are its *yong* "function"'. On *Analects* 1.12, he cites an earlier commentator who says, 'The *ti* "substance" of all rituals rests in reverence but in their *yong* "application" harmony is valued'.

Later Confucian thinkers tried, unsuccessfully, to deploy the two concepts to effect a synthesis or at least a symbiosis of Chinese and Western culture. The first and best-known example of such attempts was that of Zhang Zhidong (1837-1909), who coined the slogan, 'Chinese learning for *ti* "substance" and Western learning for *yong* "utility"' (Levenson 1965: 60): traditional Chinese culture was to serve as the fundamental basis for a modern Chinese society that adopted Western technology and ideas, but only for their efficacy. However, since the *ti* and *yong* of any given thing are inextricably related to one another, there was no hope of ever separating them in the way Zhang suggested.

Tian

Tian*, conventionally translated as 'Heaven', is both what our world is and how it is. The myriad things are not the creatures of* tian *or disciplined by a* tian *which stands independent of what is ordered; rather, they are constitutive of it.* Tian *is both creator and the field of creatures. There is no apparent distinction between the order itself and what orders it. This absence of superordination is a condition made familiar in related notions of the Daoist* dao *and the Buddhist* dharma*, which also refer to concrete phenomena and the order that obtains among them. On this basis,* tian *can be described as an inhering, emergent order negotiated out of the dispositioning of the particulars that are constitutive of it. In the human world,* tian *is the experience of meaningful context felt differently by each person in the fellowship of family and community.*

The conventional translation of *tian* as 'Heaven' (with a capital 'H') inappropriately conjures up the notion of transcendence, concealing precisely those aspects of the term most essential to a correct appreciation of its meaning. We can, however, make several observations that reinstate aspects of *tian* that tend to be concealed by this translation. First, the association between *tian* and the sky encourages proper notice of the profound temporality and historicity that attends this idea, frustrating any analogy one might want to find between '*tian*' and 'sky' on the one hand and 'Heaven' and 'the heavens' on the other. *Tian* is inextricably linked to the pervasive processes of change, and is understood often as an abbreviation of *tiandi* (heaven and earth), or 'the autogenerative and self-sustaining world'. The Judaeo-Christian God, often referred to metonymically as 'Heaven', *creates* the world, but classical Chinese *tian is* the world.

Tian further is not only 'the sky', but an articulated and patterned sky. *Tian* is thus defined as the 'day' and the 'skies' under which culture accumulates, rather than as some more disjunctive atemporal and aspatial 'Other', some ontologically different order of Being. Significantly, there is a continuity between the articulation of nature generally, and the inscription of human culture. The nature-nurture dualism familiar in Greek-based culture is not operative; instead, the natural world and human culture are both vigorous and continuous.

A corollary to this notion of an invigorated world is the absence of any final boundary between the sentient and insentient, animate and inanimate, living and lifeless. Since spirituality and life go hand in hand, spirituality, like life, pervades all things.

To say that spirituality and life are all-pervasive has two immediate implications. First, there is no value-neutral nature which can stand as encouragement for the pathetic fallacy. Humanity, instead of constituting a privileged link along a Chain of Being which discriminates on the basis of given ontological disparities, achieves its hierarchical cosmic role through its cultivation of a complex spirituality, where this spirituality is understood in terms of extension, influence, and inclusion. In fact, as is evident from the connotations of the character *shen*, conventionally translated as both 'human spirituality' and 'divinity', and also from entrenched cultural practices such as ancestor worship and the worship of cultural heroes such as Confucius, gods in the Chinese tradition are generally 'extended human beings' (see Confucius). *Tian* itself is the aggregate spirituality generated by a continuous culture.

Tian is 'self-so-ing' (*ziran*). There is no distinction between nature and its power of organization and generation. There is nothing antecedent to it; there is no beginning to it or end of it. *Tian* is also anthropomorphic, suggesting its intimate relationship with the process of euhemerization that grounds Chinese ancestor worship. It is probably this common foundation in ancestor worship that allowed for the conflation of the Shang dynasty's *di* with the notion of *tian* imported with the Zhou tribes. There seems to be sufficient reason to assume that *tian*, like all Chinese gods, is by and large constituted by dead people. Culturally significant human beings - persons such as the Duke of Zhou and Confucius - ascend to become *tian*, and *tian* is itself made determinate in their persons. This is the meaning of the familiar notion, *tianren heyi* (the continuity of *tian* and humanity). Not only does *tian* entail anthropomorphism - gods are man-shaped - it also entails a 'theomorphism' - exemplary persons are god-shaped. Worthiness in the human world defines *tian*. As a narrative constituted by cultural heroes, *tian* thus is genealogical and biographical.

Tian is not only culturally specific, it is also geographical. The discovery of a new and sophisticated culture would

anticipate the discovery of a *tian* representative of that culture. Just as there are many skies, one would expect other cultural traditions to have *tian* of their own.

Finally, *tian* does not speak but communicates effectively, although not always clearly, through oracles, perturbations in the climate and alterations in the natural conditions of the human world. *Tian* participates in a discourse shared by the human community: at least, by the most worthy among them. Given the interrelatedness and interdependency of the orders defining the Chinese world, what affects one affects all. A failure of order in the human world will automatically be reflected in the natural environment. Although *tian* is not a 'personal' deity responsive to individual needs as in the Judeo-Christian world view, as aggregate ancestor it would seem that *tian* functions impartially on behalf of its progeny to maximize the possibilities of emergent harmony at all levels.

Tibetan philosophy

*Tibetan philosophy - if we can make a rough separation between what is predominantly argument-oriented and analytical and what is more a question of ritual, devotion or vision - is best characterized as a form of scholasticism. It exhibits marked parallels with philosophy in Western medieval contexts, including a heavy emphasis on logic, philosophy of language and metaphysics, all in the service of exegesis of religious doctrine found in root texts. Just as in Western scholasticism, there is a reliance upon scripture, but within that traditional context there is also ample room for rational analysis and synthesis of potentially disparate doctrines, as well as a considerable quantity of argumentation which is a type of 'fine tuning' of Indian issues. Tibetan thinkers explored matters which are often of genuine importance in our understanding of Indian texts. In particular, in Mādhyamika Buddhist philosophy we find an important synthesis of Indian Yogācāra ideas with a relatively natural interpretation of key ideas in the literature on the Buddha-nature (*tathāgatagarbha*); we also find important debates on the nature of the two truths, the status of means of valid cognition (*pramāṇas*), and on questions of philosophical method, such as the possibility or impossibility of Mādhyamikas holding theses and themselves defending positions. Beginning with the Great Debate of bSam-yas (Samyay) in the latter part of the eighth century, we find constantly recurring reflection on questions concerning the nature of spiritual realizations and the role of conceptual and analytic thought in leading to such insights. In the logico-epistemological literature, the hotly debated issues generally centre around the problem of universals, the Indian Buddhist philosophy of language and the theory of the triply characterized logical reason (*trirūpahetu*). In addition, the Tibetans developed an elaborate logic of debate, an indigenous system containing many original elements unknown in or even alien to Indian Buddhist logic.*

1 1 Issues in Mādhyamika philosophy

Tibetan Buddhist thinkers, being generally adherents of some form of the Mādhyamika, had to provide answers to the question as to what was the correct and highest interpretation of Nāgārjuna's thought and what were the erroneous interpretations and traps into which thinkers might fall when dealing with this difficult and often maddeningly ambiguous Indian philosopher (see Nāgārjuna; Buddhism, Mādhyamika: India and Tibet). Thus, for example, the Sa-skya-pa (Sagyaba) thinker Go ram pa bSod nams seng ge (Goramba Sönam sengge, 1429-89), in a text called *lTa ba'i shan'byed (Differentiation of the Views)*, polemically described three types of Mādhyamika philosophy in Tibet: (1) those which took the extreme of permanence to be the middle way; (2) those which took the extreme of annihilation to be the middle way; (3) the Mādhyamika free from extremes. The first two views are those of mistaken interpreters, while the latter is supposedly Go ram pa's own. The dGe-lugs-pa (Gelukba) thinker 'Jam dbyangs bzhad pa (Jamyang shayba, 1648-1722), in his *Grub mtha' chen mo (Great Systems of Tenets)*, speaks of three sorts of erroneous view: (1) the theory of the Chinese monk Hva-shang and certain bKa'-brgyud-pa (Gagyuba) philosophers that nothing exists (*ci yang med*); (2) the voidness-of-what-is-other (*gzhan stong*) theory of the Jo-nang-pa (Jonangba); (3) the view that the Mādhyamika does not accept means of valid cognition (*pramāṇas*), does not accept anything himself on either of the two levels of truth and does not have a system of his own (*rang lugs*).

To take the first view mentioned by Go ram pa (the second one mentioned by 'Jam dbyangs bzhad pa), much of Tibetan thought was indeed strongly influenced by an indigenous version of the Mādhyamika which attempted to integrate Nāgārjuna's thought with Yogācāra and with the principal ideas in Indian texts such as the *Ratnagotravibhāga (Differentiation of the Lineage of the [Three] Jewels)*, an early fifth-century text which notoriously speaks of a permanent (*nitya*), stable (*dhruva*) and eternal (*śāśvata*) Buddha-nature present in sentient beings. This Tibetan synthesis was initially put forward by the Jo-nang-pa school, founded by Dol bu pa Shes rab rgyal mtshan (Dolbuba Shayrap gyeltsen, 1292-1361); for reasons that will become clear, the Jo-nang-pas and their successors came to be known as gZhan-stong-pas (Shendongbas), 'those who accept voidness-of-what-is-other'. The gZhan-stong-pa position had adherents in three of the four major traditions of Tibet - namely the Sa-skya, the bKa'-brgyud and the rNying-ma (Nyingma) traditions - and was championed by such major Tibetan thinkers as gSer mdog Paṇ chen Śākya mchog ldan (Serdok Paṇchen Shākya chokden, 1428-1507), Tāranātha (b. 1575) and many others (see Mi bskyod rdo rje); in the nineteenth century, with the 'rediscovery' of the Jo-nang-pa texts, it became the philosophical underpinning of the 'nonsectarian movement' (*ris med*), founded by the syncretic thinker 'Jam mgon kong sprul (Jamgön gongtrul, 1813-99). Only the

dGe-lugs-pa school rejected it completely and unanimously, the Jo-nang-pas being for them a sort of *bête noire* both politically and philosophically, against which Tsong kha pa Blo bzang grags pa (Dzongkaba Losang dragba, 1357-1419) and his school repeatedly directed their ire.

The Jo-nang-pas and other gZhan-stong-pas relied on an adaptation of the Yogācāra theory of voidness that one finds in the *Tattvārtha* chapter of Asaōga's *Bodhisattvabhūmi*. This they combined with the three-nature theory found in the *Saṃdhinirmocanasūtra(Discourse on the Interpretation of the [Buddha's] Thought*; possibly second-fourth centuries AD), the theory that things have falsely imagined natures (*parikalpitasvabhāva*) invented by thought and language, causally dependent natures (*paratantrasvabhāva*) and an absolute or a perfected nature (*parinispannasvabhāva*) (see Buddhism, Yogācāra school of). The combination of Yogācāra with the *Ratnagotravibhāga* yields the key Tibetan distinction between 'void-of-oneself' (*rang stong*) and 'void-of-what-is-other' (*gzhan stong*) that has inspired enormous debates in Tibetan Mādhyamika up to the present day. In brief, the fundamental gZhan-stong-pa ideas go like this for a Jo-nang-pa: the Absolute, *parinispannasvabhāva*, whose existence enables us to avoid the nihilistic view that everything is just a complete illusion, is only void of the imagined and dependent natures: it is void of what is other than it, but is not void of itself. The imagined and dependent natures, on the other hand, are nonexistent and are void of themselves. This key stance is then fleshed out to include most of the other major currents in Indian Mādhyamika, Yogācāra, Tathāgatagarbha and even Tantric systems: for example, Nāgārjuna's arguments in the *Mūlamadhyamakakārikā* show only that conventional truths (*saṃvṛtisatya*) are void of themselves; the Absolute is an existent, truly established gnosis (*ye shes*); as in Yogācāra thought, this gnosis admits of no distinction between subject (*grāhaka*) and object (*grāhya*) and is suchness (*tathatā*) and the *bhūtakoṭi* ('limit of the real'); it is identifiable with the Buddha-nature spoken of in the *Ratnagotravibhāga*; Tantric principles such as the union of voidness and bliss (*bde stong zung 'jug*) are said to be inexplicable without this version of voidness.

Not surprisingly, the Jo-nang-pas were often criticized, especially by the dGe-lugs-pas, but also by Sa-skya-pas such as Go ram pa, as reifying the Absolute and thus transforming Buddhism into a substantialist philosophy. This is what was behind Go ram pa's charge that this school 'took the extreme of permanence as the Middle Way'. (The Mongolian dGe-lugs-pa writer Thu'u bkwan Chos kyi nyi ma (Tugen Chögyi nyima, 1737-1802) went so far as to say that the Jo-nang-pas were in effect like partisans of a type of Brahmanism.) The Jo-nang-pas thus supposedly went badly astray from Indian Mādhyamika by adopting positive descriptions which hypostasized a permanent Absolute, although, in all fairness, it has to be said that this criticism largely depends on which Indian texts one emphasizes and what literature one takes as authoritative. It can be intelligently argued in defence of the Jo-nang-pas that there were Indian Mādhyamika texts, like the hymns attributed to Nāgārjuna, which did exhibit a positive, cataphatic approach not far from that of the *Ratnagotravibhāga*, and that Indian Mādhyamika did not consist exclusively in the negative apophatic dialectic or the insistence upon dependent origination (*pratītyasamutpāda*) that one finds in Nāgārjuna's *Mūlamadhyamakakārikā*.

2 2 Subschools of Mādhyamika

Tsong kha pa and his followers, the dGa'-ldan-pa (Gandenba) and then the dGe-lugs-pa school, reject this all-encompassing syncretism, arguing that Yogācāra and Mādhyamika are quite distinct schools, and that Tantra and the Tathāgatagarbha theories are to be interpreted along the lines of Nāgārjuna, and especially along the lines of the branch of Mādhyamika founded by Candrakīrti, the so-called Čast;Prāsaōgika or Thal-'gyur-ba (Talgyurwa) school. Whereas the Čast;Svātantrika or Rang-rgyud-pa (Ranggyuba) philosophy of Indian Mādhyamika, attributed by Tibetans to Śāntarakṣita, Bhāvaviveka *et al.*, had been dominant in the earlier diffusion of Buddhism in Tibet (starting in the eighth century) and had been the philosophy of the first traditions in the beginning of the second diffusion (from the eleventh century on), Tsong kha pa came squarely down on the side of the Čast;Prāsaōgika Mādhyamika, a school which owes much of its influence in Tibet to Pa tshab Nyi ma grags (Batsap Nyimadrak, b. 1054/55), who was the translator of Candrakīrti's *Madhyamakāvatāra (Introduction to the Middle Way)* and other works. Note that the terms Čast;Prāsaōgika (*thal 'gyur ba*) and Čast;Svātantrika (*rang rgyud pa*), although frequently used in the modern secondary literature, are not clearly attested in Indian texts. This terminology to distinguish between Mādhyamika schools is Tibetan in origin and is especially found in a genre of literature which had great importance in Tibet, the hierarchical presentation of the 'systems of tenets' (*siddhānta*; *grub mtha'*) of the four Indian Buddhist schools and their various subschools.

There were numerous theories among Tibetans of the eleventh to fifteenth centuries about what the difference between Čast;Svātantrika and Čast;Prāsaōgika actually came down to - indeed, the matter took on such importance that the question of how to construe the difference became one of the key issues in Tsong kha pa’s thought, just as it was a key issue for his predecessors and for many of his successors. Some Tibetans had conceived of the difference between Čast;Svātantrika and Čast;Prāsaōgika solely in terms of the logical forms which the two schools employed (namely, objectively valid reasons versus mere *reductio ad absurdum*); others focused on the fact that Čast;Prāsaōgika rejected means of valid cognition (*pramāṇas*) while Čast;Svātantrika did not, or on the fact that Čast;Prāsaōgikas did not have any theses (*pakṣa*) whatsoever of their own, not even on conventional matters. (Compare ’Jam dbyangs bzhad pa’s third type of erroneous Mādhyamika.) Reacting to the views of these opponents, Tsong kha pa formulated the difference as turning, above all, on a difference in ontology, in particular on the acceptance or rejection of things being in some way established with/through their own intrinsic natures (*rang bzhin*; *svabhāva*). *Svabhāva*, a key notion that Nāgārjuna and his commentators argue against, figures throughout the Tibetan presentations of the systems of Buddhist schools in the *grub mtha’* literature, but with each school adopting an ever subtler position on the question - it is only, according to Tsong kha pa, the Čast;Prāsaōgika branch of the Mādhyamika school which rejects it completely and unconditionally; the Čast;Svātantrikas still hold on to a kind of rarefied version of *svabhāva*, albeit only on the level of conventional truth. The basic argumentation for this attribution turns on the Čast;Svātantrikas’ own construal of the Yogācāra three-nature theory.

The question as to precisely what a Mādhyamika denies became a major issue in Tibet. A dominant trend in Tibetan Mādhyamika thought was that promulgated by Pa tshab’s disciple Zhang Thang sag pa (Shang tangsakba), Go ram pa bSod nams seng ge and others, a position which came to be known as ‘the Mādhyamika free from extremes’ (*mtha’ bral dbu ma*) and which was often depicted as ‘the view of neither being nor nonbeing’ (*yod min med min gyi lta ba*). This view advocated using Mādhyamika-style arguments to show the incoherence of any and all things that one might analyse, with the result that no predication of being, nonbeing, both being and nonbeing, or neither being nor nonbeing is rationally justified. We thus have, on this interpretation of the Mādhyamika, a literal and unqualified negation of all members of the ‘tetralemma’ (*catuṣkoṭi*), with the purpose of thoroughly overcoming the possibility of any conceptualizations and discursive thought. This ‘Mādhyamika free from extremes’, it should be remarked, is a pretty fair characterization of the usual Indian position, and corresponds quite well to the way in which certain important Western authors would characterize Indian Mādhyamika. (In this sense, S. Matsumoto (1990) is certainly right to stress just how remarkable and unique Tsong kha pa was in the history of Indo-Tibetan Mādhyamika in *opposing* the fundamental position of the ‘Mādhyamika free from extremes’.)

The question does, however, arise as to whether this version of the fourfold negation leads to a deviant logic, as negating nonbeing would seem to imply being, and negating the last lemma would seem to imply being or nonbeing. Tsong kha pa and his school avoid these types of unwelcome consequences by adding the modal qualifiers ‘truly’ (*bden par*) and ‘conventionally’ (*tha snyad du*) to the tetralemma, so that, for example, the first two negations end up being that things are not truly existent and not conventionally nonexistent. The tactic obviously avoids violations of logical laws. Equally, it allows the Mādhyamikas to make a clear separation between the conventional and the ultimate, so that they can argue that a thing like a pot exists (conventionally) and is established by means of valid cognition. We can thus easily hold the thesis that the pot exists, but where the Mādhyamika philosophy comes in is to show that it does not *truly* exist. Indeed, the advocates of the ‘Mādhyamika free from extremes’, as well as the gZhan-stong-pas, do have serious problems in accounting for conventional truths: to say, for example, that such truths merely exist for mistaken minds (*blo ’khrul ba’i ngor yod pa*) and are not established by means of valid cognition (*pramāṇas*) comes perilously close to just falling into the trap of subjectivism, where one says that things exist or have such-and-such properties when one believes that they do. (Quite a bit more than *that* is needed to explain how we can discover new things and how we can show that things which many people believe in at some particular time do not exist and have never existed even conventionally.) The issue of the acceptance or rejection of *pramāṇas* establishing conventional truths is developed at length from the fifteenth century onwards, starting with a critique of Tsong kha pa on this and other points by the Sa-skya-pa thinker sTag tshang lōtsa ba (Daktsang lodzawa, b. 1405).

It should be stressed that the logical simplicity and lucidity of Tsong kha pa’s version of Mādhyamika comes at a

high exegetical and philosophical price: not only is he constrained to add words everywhere to Indian texts, but, what is perhaps more serious, he can well be accused of inventing a factitious notion, ‘true existence’, which he then refutes as incoherent and contradictory, leaving the ordinary world intact and even reified. This was a common criticism of Tsong kha pa. Arguably, as his critics maintained (be they advocates of the ‘Mādhyamika free from extremes’ or gZhan-stong-pas), Nāgārjuna and his commentators were showing the utter incoherence of ordinary things themselves, and were leaving nothing whatsoever unassailed and intact among these conventional entities.

3 3 The role of conceptual understanding in spiritual realization

Tibetan thought on the nature of meditation and spiritual realization seems to be divided into two camps, both stemming (in very complex ways) from the Great Debate of bSam-yas (Samyay) in the latter part of the eighth century. This debate was a (year-long?) series of exchanges which are reputed to have opposed the ‘Gradualist’ (*rim gyis pa*) Indian Buddhism represented by Kamalaśīla and others to the Chinese ‘Subitists/Simultaneists’ (*cig car ba*), who were represented by Hva-shang Mahāyāna, a monk from Dunhuang holding Chan positions. The historical details of the Great Debate (which is with few exceptions depicted in Tibetan sources as having been won by the Gradualists) cannot be developed here, except to say that it now seems clear that several ‘heretical’ positions of Chinese, Tibetan and even Indian origin were under attack from the Kamalaśīla side.

In fact, as D. Seyfort Ruegg (1992) has insightfully remarked, the debate became a partly dehistoricized topos in the Tibetan representation of the history of their own philosophy. The bSam-yas debate and its traces were perceived to recur constantly in the form of an opposition between two models of the Buddhist path, namely mediacy versus immediacy - the path taken as a progression, where philosophical analysis and various moral practices lead step by step to awakening versus the path which is not a series of intermediate steps, but is fundamentally identical with the fruit to be attained. This latter ‘path’ is one where realization comes from a mode of awareness that is characterized by no mentation (*amanasikāra*; *ci yang yid la mi byed pa*), an awareness that consists in seeing or coming face to face (*ngo ’phrod*) with the nature of the mind (*sems nyid*) without reliance upon any concepts whatsoever - this realization is all we need to become enlightened at once. To take an important example of the recurrence of this debate, the thirteenth century’s greatest thinker, Sa skya Paṇḍita (Sagya Paṇḍita, 1182-1251), makes a rapprochement between the Hva-shang side and the Tibetan tradition of Great Perfection (*rdzogs chen*) by criticizing the ‘Self-sufficient White Remedy’ (*dkar po chig thub*) doctrine of the bKa’-brgyud-pa scholars sGam-po-pa (Gamboba, 1079-1153) and Zhang-Tshal-pa (Shangtselba, 1123-93) as being a revival of the ‘Great Perfection of the Chinese tradition’ (*rgya nag lugs kyi rdzogs chen*). (Compare ’Jam dbyangs bzhad pa’s first type of erroneous Mādhyamika.) Another example: for Tsong kha pa, Hva-shang becomes an exponent of a mere blank-mindedness, a kind of stupefaction where one supposedly rests virtually unconscious. This Hva-shang-style blank-mindedness is then taken to be what will ensue if, like certain ‘Mādhyamikas free from extremes’ who deny ‘too much’, one rejects all entities and all predication whatsoever and hence fails to make the proper distinction between so-called truly established things and conventional things.

What was the issue? Did the Hva-shang position lead to nothing but voluntary stupefaction, as Tsong kha pa and even some contemporary Western writers depict it? To use Ruegg’s phrase, the Great Debate involved ‘lattices’ of related ideas, and the lattice of ideas associated with the partly dehistoricized version of the Hva-shang position involves, very noticeably, the idea of an innate nature which is in some sense already perfect and actual. Indeed, in a twelfth-century account of the Great Debate, the *Chos ’byung me tog snying po*, and in the sixteenth-century historical work the *mKhas pa’i dga’ ston (Feast for Scholars*; Minzu chubanshe edition, 1986: 389; see also Ruegg 1992: 73, 86, note 164), one of the ways in which the issue is formulated is whether sentient beings are ‘Buddhas from the beginning’ (*dang po nas sangs rgyas*) - Hva-shang’s side supposedly advocated a kind of innate version of the Buddha-nature (*tathāgatagarbha*) existing fully *ab initio*, not just as a germ or potentiality for enlightenment, but as already accomplished. (Compare, for example, the view found in the nine sorts of Great Perfection teachings described in an early work, the *bSam gtan mig sgron (Lamp for the Eye of Meditative Absorption)* of gNubs Sangs rgyas ye shes (Nup Sanggyay yayshay, tenth century): ‘The nature of the Buddha, sentient beings and their objects is to be without exception enlightened in the great state of the spontaneous *dharmatā*, which is without beginning nor end’ (1974: 320; see also Karmay 1988: 114).) It is not surprising, if one holds that there is a type of innate perfected nature, that the path should consist essentially in stopping thought and seeing this nature. It is also probably not very surprising that focusing on good actions along the path should

seem to Subitists such as Hva-shang and others a significant distraction. Non-mentation would not be a stupefaction, where the mind is reduced to virtual insentience, but would be more like a re-cognition or ‘anagnosis’ (to use the phrase of Giuseppe Tucci (1980: 13)) of what was already there.

Kamalaśīla’s side and its later followers of course panned this Buddhahood *ab initio* as an utter absurdity. During the Debate, for example, Ye-shes dbang-po (Yayshay wangbo) supposedly argued: ‘If you accede simultaneously [to enlightenment] then why are you still doing anything; if you are a *buddha* from the beginning (*dang po nas sangs rgyas*), what then is wrong?’ (*mKhas pa’i dga’ ston*, 1986: 389). And elsewhere on the same page in the *mKhas pa’i dga’ ston*, he is represented as criticizing the idea of ‘being enlightened without having done anything’ (*ci yang ma byas par ’tshang rgya ba*). All this is a kind of Gradualist common sense, but it is also somewhat unimaginative, especially so in that a number of clear-headed Tibetan and Chan philosophers devoted a lot of deep thought to this difficult subject and seem to have been quite aware of the gross absurdities into which one should not fall.

Finally, it is hard to agree with Samten Karmay (1988: 87-8) that the Subitists and Gradualists both accepted an identical version of the ‘spiritual basis’ (*gzhi*), and that therefore the debate turned only on questions of method. Karmay argues this because of ‘correspondences’ that he sees between various key terms on each side, although these correspondences are far from clear; even when the same word is used on the Gradualist and Subitist sides (for example, *tathāgatagarbha*), it is unlikely that the concept is being taken in altogether the same way. In short, the idea of some sort of innate perfected nature is a crucial issue in the Great Debate; we are not dealing just with methods. Indeed, if there is only method involved, and no question of Buddhahood *ab initio* being re-cognized, the general Subitist position becomes an almost grotesquely unintelligent method, and the criticisms by Kamalaśīla, Tsong kha pa and others about meditation without analysis yielding a rather useless mental *tabula rasa* become difficult to avoid.

4 4 Epistemology, logic and philosophy of language

The major developments by Tibetans in this area are to be found in the interaction of two currents of interpretation of Dignāga and Dharmakīrti’s thought (see Dignāga; Dharmakīrti). The first current has its origin largely in gSang-phu Ne’u-thog monastery (Sangpu Nay-utok, founded in 1073), in the works of rNgog lōtsa ba Blo ldan shes rab (Ngok lodzawa Loden shayrap, 1059-1109), Phya pa Chos kyi seng ge (Chaba Chögyi sengge, 1109-69) and their disciples. Subsequently, Phya pa’s *Tshad ma’i bsdus pa (Summaries of Epistemology and Logic)* became the groundwork for the ‘Collected Topics’, or *bsdus grwa* (düra) literature, which furnished so much of the epistemology of the dGe-lugs school. From what we can glean of Phya pa’s thought from other works in his tradition and the works of his adversaries - his own works have not survived - he combined a creative intellect with what was probably a quite lacunary knowledge of the main texts of the Indian Buddhist epistemological school: the result is not unlike what we find in certain early Chinese Buddhists, namely numerous insightful interpretations and new ideas, and, at the same time, many notions which were no doubt invented and had no actual basis in Indian texts.

The gSang-phu positions were strongly criticized by Sa skya Paṇḍita, the Tibetan who probably came closest to faithfully representing the positions of later Indian epistemology and logic. In his *Rigs gter (The Treasure of Reasoning)*, we find a repeated trenchant critique of ‘Tibetans’ or ‘Tibetans who pride themselves on being logicians’ - polemical shorthand for the gSang-phu philosophers. None the less, gSang-phu thought had a persistent appeal due to what must have been its extremely seductive appearance of subtlety and rigour - indeed, as D. Jackson (1987: 137-8) points out, Śākya mchog ldan reported that in his time, in the fifteenth century, people often felt that the ‘Summaries’ were subtle and proven correct, while the *Rigs gter* was ‘extremely rough’.

Central to the gSang-phu-ba versus Rigs-gter-ba debates was the problem of universals (see Universals, Indian theories of §3). The gSang-phu side (including the dGe-lugs) maintained a type of realism where at least some universals were thought to be real entities (*dngos po*), while Sa skya Paṇḍita himself and many of his Rigs-gter-ba followers, such as Go ram pa and Śākya mchog ldan, argued for the more usual Dharmakīrtian *apoha* theory, maintaining the unreality of all universals, indeed of all objects of conceptual thought. (The *apoha* theory of language is the Buddhist explanation of the unreality of all concepts, treating a concept of *A* as a mind-invented exclusion of non-*A* (see Nominalism, Buddhist doctrine of).) Indian Buddhism’s philosophy of language was thus considerably reinterpreted by the Phya-pa school, especially by the dGe-lugs-pa. The latter would find textual

sources in later writers like Śaōkaranandana, but while certain Indian Buddhists (for example, Dharmottara, Mokṣākaragupta and perhaps Śaōkaranandana) were probably tending towards some form of realism on the question of universals, it is very difficult to see how the Tibetans' rationale for realism had much, if anything, to do with the reasonings of these Indian Buddhists. The Phya-pa school's interpretation of the Dignāgan-Dharmakīrtian version of concepts-*qua*-exclusion (*ldog pa*; *vyāvṛtti*), which they also applied to universals, logical reasons and all other mind-invented constructs, was to say that 'exclusion itself' or 'universal itself' (*spyi kho rang*) is unreal, but not all exclusions, universals, and so on, are unreal. The point probably partly turns on certain features of the Tibetan language which make this type of explanation possible. This and closely related moves, which the dGe-lugs-pas would maintain to be at the heart of 'the difficult point of the *apoha* theory' (*gzhan sel dka' gnad*), had already been criticized by Sa skya Paṇḍita himself and would be devastatingly attacked by Śākya mchog ldan.

There were also numerous Tibetan developments in epistemology which genuinely contributed to clarifying key Dignāgan and Dharmakīrtian issues: for example, the Tibetan debates on the theory of truth in Indian Buddhism, on the notion of nonperception (*anupalabdhi*), and on the use of scriptural arguments, and Tibetan positions on the question of how to interpret Dharmakīrti's proofs of the Buddha's authority. We find gSang-phu-bas and Rigs-gter-bas offering (conflicting) explanations of Dignāga's *Hetucakra (The Wheel of Logical Reasons)*, in particular of the so-called 'inconclusive reason which is too exclusive' (*asādhāraṇānaikāntikahetu*), which is by far the most difficult fallacy to understand in Dignāga's system of nine reasons. We also find the gSang-phu traditions, including the dGe-lugs, accepting many of the key elements of Ratnākaraśānti's idea of 'intrinsic entailment' (*antarvyāpti*) as presented in his *Antarvyāptisamarthana (The Justification of Intrinsic Entailment)*, even though these same thinkers still did not go so far as to accept the Antarvyāptivāda position that examples are dispensable in argumentation, and are only used for dullards (*rmongs pa*). There were actually very few Tibetans who considered themselves real Antarvyāptivādins, the major possible exception being the Sa-skya-pa thinker Nya dbon Kun dga' dpal (Nyawön Güngapel, *c*.1300-80), who is said to have espoused this view in his now lost commentary on Dharmakīrti's *Pramāṇavārttika (Commentary on Valid Cognition)*.

The Phya-pa tradition, largely independently, developed a remarkably sophisticated type of debating logic, with consequences (*thal 'gyur*; *prasaōga*) replacing the usual triply-characterized reasons (*trirūpahetu*) and inferences-for-others (*parārthānumāna*) of Indian Buddhist argumentation. This logic, which one finds elaborately developed in *bsdus grwa* texts, has a unique type of quantification and employs variables. The Dharmakīrtian idea of the general entailment (*vyāpti*, literally 'pervasion') between the reason and what is to be proved had presented enormous philosophical problems in Indian logic, as it was very difficult to say precisely how one was to establish or know for certain when there was *vyāpti* - *vyāpti* had to be assured by ascertaining a necessary connection (*sambandha*) between terms (see Inference, Indian theories of §§5-6). In this debating logic, however, the epistemological questions as to how we know that there really is *vyāpti*, or that there can be no counterexamples, are of curiously minor importance; they are, in any case, separated from the purely logical matter of the truth conditions for a universally quantified statement, that is, absence of counterexamples. This is a type of progress, freeing the logical and formal matters around *vyāpti* from the probably unsolvable epistemological issues which preoccupied the Indians. Interestingly enough, the Phya-pa school and its successors, in their classifications of various types of consequences as having twelve different types of *vyāpti*, went into considerable detail on the logical connections between statements in a way which was quite unknown in India. Moreover, we see here and elsewhere a marked turn towards a formal perspective: saying, for example, that such-and-such a consequence-statement will satisfy a certain kind of *vyāpti* if it satisfies another kind is indeed an abstraction away from content to matters of form. It is, however, difficult to argue that the rules and approach of this logic represent a propositional or term logic of the sort developed by Stoic or Aristotelian philosophers, although it is certainly not opposed to classical theorems.

Tillich, Paul (1886-1965)

Tillich was one of the most influential Christian theologians of the twentieth century. Notable for his effort to translate the language of the Western religious tradition into terms comprehensible to modernity, he drew upon various secular philosophies, including Marxism, existentialism and psychoanalysis, as well as literature and the arts. In his view, these contemporary secular expressions contain the questions which theology must address. He was sometimes criticized for losing one or another aspect of Christian orthodoxy, but more often praised for making it possible to be both Christian and modern. He fled Germany in 1933, in the early days of Nazism. As an expatriated German who became an American citizen, Tillich came to understand his life as one standing 'on the boundary'. He saw himself as an interpreter, occupying the boundary between the Old World and the New, between philosophy and theology, between religious orthodoxy and humanistic secularity, and between university and church.

Tillich was an intellectual who achieved widespread popular acclaim. Even though his lectures and publications were strewn with allusions to obscure thinkers, he gained a substantial following and was frequently quoted in the popular press. His courses were immensely popular, and his sermons - delivered mostly in college chapels - met with great public approbation.

Two of Tillich's themes stand out as most influential. First was his advocacy of a broadened category of the religious. By defining religion as a person's 'ultimate concern', he was able to maintain that virtually everyone has some religious commitment. Through this conceptualization it became possible to view such twentieth-century ideologies as Nazism and Communism - as well as Americanism - as in significant respects religious perspectives. This broadened definition of religion gained wide acceptance, with sociopolitical and even judicial implications. (The US Supreme Court's definition of conscientious objection was influenced by Tillich's formulation.) Second, Tillich's persistent claim that all language about God is symbolic had great impact. Objecting to views of religious language as merely *symbolic, he contended that efforts to be literal in one's talk of God are seriously deficient. By the same token, he argued that the mythic quality of religious narratives cannot be removed without detriment. Finding much American religion strongly literalistic, Tillich persistently argued the contrary view.*

1 Life

Paul Tillich was born in the village of Starzeddel in eastern Germany (now in Poland), the son of a minister and high official of the Evangelical Church of Prussia. After studying philosophy and theology, receiving advanced degrees at Breslau (1910) and Halle (1912), he entered the ministry and became a chaplain in the German army at the outbreak of World War I. At the conclusion of the war - which was at once traumatic and transformative for him - he began an academic career, becoming a professor of philosophy and theology, first at Berlin and subsequently at Marburg, Dresden and Frankfurt. In the late 1920s he participated in a religio-political movement called 'religious socialism', which attempted to offer an ideological alternative to traditionalistic and pro-capitalist views on the one hand and fascist and communist views on the other. Tillich's *The Socialist Decision* (1933) derives from this period and is thought to be one of the first theological essays to analyse the dangers of the Nazi movement. During this period he also argued that German Christians ought to align themselves with the Jews of Germany rather than succumbing to the prevailing anti-Semitism. With Hitler's accession to power in 1933, Tillich was dismissed from his position at the University of Frankfurt; he was among the first to be removed from his state university appointment. Soon thereafter he sought refuge in the USA.

Gradually mastering the English language, Tillich spent his American career as a professor at three influential educational institutions: Union Theological Seminary at Columbia University (1933-55), Harvard University (1955-62) and the University of Chicago (1962-5). Although his involvements were therefore predominantly academic rather than churchly or political, he became widely influential as an interpreter of American culture and its religious dimension (termed by Tillich 'the depth dimension'). The English-speaking public became familiar with his earlier cultural analyses, which were frequently informed by Marxian categories, through the translated essays collected in *The Protestant Era* (1948); during his years in the USA, he produced the essays found in *Theology of Culture* (1959). Tillich's increasing engagement with psychology, principally Freudian, and his increasing use of existentialist categories were reflected in his widely read work *The Courage To Be* (1952), while

his distinctive combination of ontology and ethics was displayed in *Love, Power and Justice* (1954). The most significant of his English language publications was the three-volume *Systematic Theology* (1951, 1957, 1963), the first volume of which contains many of his most penetrating contributions to philosophy and theology.

In 1960, Tillich journeyed to Japan, where he engaged in dialogues with Zen masters and other religious leaders. The trip represented the culmination of a shift in his interests from dialogue with Western secularity to dialogue with non-Western religions, a shift reflected in the slender but important volume *Christianity and the Encounter of the World Religions* (1963), and in his last public lecture, ‘The Significance of the History of Religions for the Systematic Theologian’, found in the posthumous collection of essays *The Future of Religions* (1966).

2 Epistemology and ontology

Like his nineteenth-century mentors, the German idealist philosophers Fichte, Schelling and Hegel, Tillich sought to discover a new path to ontology. Following the lead of his contemporary, the existentialist philosopher Martin Heidegger (§2), he concluded that ‘the way to ontology passes through the doctrine of man’. Reaffirming the Renaissance notion of the human as microcosmic, Tillich asserted that the structure of being can be discovered in and through us in the polarity of the ‘self-world correlation’. The structures of finitude (as well as its destructive tensions) can be analysed philosophically, but finitude is not self-sufficient. Finitude has to ask about the possibility of a self-caused ground of being, beyond finitude. Such a ground can be conceived as ultimate reality or the unconditioned, but proofs for its existence fail. Indeed, argued Tillich, existence belongs to finitude and suggests limitation. If the unconditioned is real, it lies beyond the self-world correlation and is not a being which exists as an object for us as subjects. Nevertheless, ontology shares the existential anguish: it longs for an ultimate in being and meaning.

3 Revelation and God

Tillich followed Aquinas in asserting the equivalence of the ground of being and God. The modern ontological quest replaces static with dynamic categories; power and life replace being and substance as the fundamental ontological concepts. What is sought is an unambiguous power of being, an eternal life. Revelation - the ecstasy of reason - fulfils this quest. In Tillich’s view, the world’s religions are based upon revelation. All revelatory religious language about God, however, is symbolic; religious terminology, always experiential and drawn from finitude, can only point beyond the finite towards the transcendent reality (see Religious language §3). Taken literally, it becomes idolatrous. ‘God’ is a symbol for the ultimate reality. Primary among the symbols constituting the theistic God is the personal symbol. For Tillich, this is an essential symbol because it authenticates the moral relationship of divinity and humanity; moral demand suggests that human beings are separated from what they essentially are and ought to be (thus God is judge). But this symbol must be balanced by a participatory symbol: the unity of spiritual presence (thus God is reconciling love). Morality and mystical experience - interpreted broadly as experiential aspects of individualization and participation - are for Tillich the two principal avenues to knowledge of God. Notable here is the way Tillich’s approach to God is compatible with both fatherly and motherly symbols.

4 Anxiety and faith

In his analysis of human existence Tillich drew much from Kierkegaard and other existentialists, though describing Tillich as an existentialist theologian is misleadingly one-sided (see Existentialist theology §3). Like his one-time colleagues in the Frankfurt Institute for Social Research, he drew upon a wide range of psychological, sociological and philosophical analyses of the human condition, tending, however, to use as a key coordinating concept the Hegelian/existentialist theme of estrangement. In our finite freedom we find ourselves estranged from the power of being; finitude is invariably experienced in us as anxiety. Hypothetically, any one of us could obey the injunction of Jesus to ‘be not anxious’; in fact, however, without the sustenance of some faith we fall into destructive despair.

Religious faith as interpreted by Tillich is a virtually universal phenomenon, which he analysed both as gift (or passive mystical experience) and as risky moral choice (see Faith §2). Religion, first and foremost, is the experience of being grasped by the power of an ultimate concern. All objects of such concern possess not only ultimacy or holiness but also concreteness. To the extent that they involve being grasped by ultimate reality, all faiths offer a kind of compelling self-authentication; but true faith can nevertheless be distinguished from

idolatrous faith by the extent to which the concrete symbolic object of faith is perceived as pointing beyond itself to what is truly ultimate in being and meaning. These self-authenticating aspects of faith are most fully explored in Tillich's book *Dynamics of Faith* (1957), where he shows evidence of his Lutheran heritage.

The more active, willing aspect of faith is the courage of self-affirmation and the affirmation of meaning in the face of threats to our finitude. Tillich identified the principal threats as death, guilt and meaninglessness, all of which may be subsumed under the threat of nonbeing. Both the moral/personal God of theism and the all-encompassing God of mysticism have been offered as sources of the courage to be. In the face of doubts about both of these symbols, Tillich in his most radical arguments, at the end of *The Courage To Be*, proposed absolute faith. Absolute faith may be described as affirmation of the meaningfulness of individual finite existence without the symbolic moral endorsement of the theistic God, but also without a sense of mystical fusion with the divine. Following Nietzsche, Tillich appears to arrive here at a point of the death of concrete symbols for the ultimate and a quest for new symbols.

5 The doctrine of Christ

For Tillich, Christianity's primary symbol is the sacrificial life of Jesus, or the New Testament picture of Jesus as the Christ. Jesus' life, as remembered by the early church, was a pivotal point of history, a central manifestation of Spiritual Presence. Exemplifying fully the New Being - a state beyond estrangement available fragmentarily to the believer - Jesus at the same time consistently pointed beyond himself to the ultimate reality. Consequently, his life and death became the prototypical religious symbol, in relation to which other symbols can be judged.

In this approach to religious symbols, Tillich combined what he called 'Catholic substance' and 'Protestant principle'. Symbols for God are manifold; some are more powerful than others, and around ones of uncommon power, institutions and traditions gather. These symbols and their institutional embodiments grow (and they may die) in the course of historical contingencies. Symbolic content is religious or Catholic substance in the Tillichian lexicon; without it, traditions become sterile and spiritually empty. But claims are sometimes made for religious symbols that they are, or possess significant aspects of, the reality symbolized. Then they become idolatrous and even demonic and must be criticized. Such claims fail to recognize the religious principle that only God is God; only the ultimate reality can claim ultimacy. Tillich called this the prophetic or Protestant principle. This principle of criticism must be applied against all concrete religions, including Christianity itself.

In his later lectures and publications, Tillich advocated dialogue with other religions. This was not with the intent of achieving a superficial eclectic synthesis, but rather with the hope of finding convergences by plumbing the depths of each concrete tradition.

6 Ethics and social philosophy

Tillich linked moral demand and conscience with separation and individualization; he linked love and 'transmoral' conscience (the conscience that accepts forgiveness) with reunion and participation. Indeed, he insisted that love in all its forms is the drive towards the reunion of the separated. He explicitly rejected the sharp opposition of desiring love (*eros*) and self-forgetting love (*agapē*) postulated by some theologians (see Nygren, A.). Distinctions should be made, but within a broader unity; self-forgetting love seeks the good of the other in God, but is no less than desiring love the drive towards reunion. Justice, too, is encompassed in this schematism: it preserves that which is to be reunited. Tillich's high evaluation of desiring love is unique among major twentieth-century theologians. His sensitive reflections on the intricate interweavings of body and spirit will endure as permanent contributions even if he 'failed to reconcile the power of eros with the demands of justice in his private life' (Irwin 1991: 118).

If Tillich's approach to ethics appears much indebted to German idealism, so also does his social philosophy. Early cultures are thought to be characterized by a high degree of communalism, rooted in religion (in the broad sense), and are described by Tillich as archaic 'theonomies'. Modernity brings with it trends towards autonomy, with concomitant rationalization. But modern cultures tend to become increasingly sterile and empty of meaning-giving linkages. Authoritarian heteronomies arise to counteract these threats. Only in a culture in touch with its own religious depth, yet prophetically self-critical - a new theonomy - can autonomous individualization be preserved along with meaningful participation in community. In his later work, *Systematic Theology* (Volume 3) and

Christianity and the Encounter of the World Religions, Tillich interpreted the theme of the kingdom of God as the key Christian symbol for the goal of history. This personalistic, social symbol captures the affirmation of the essential goodness of finite existence, along with a critique of the injustices of the presently existing kingdoms of this world. Although Tillich backed away from explicit commitment to socialism in his American years, he remained a steadfast critic of capitalism and the secular culture of self-sufficient finitude. He was similarly steadfast in his criticism of all forms of utopianism, whether religious or secular; nevertheless, he sought to rehabilitate the spirit of utopia, in the process suggesting a distinction relevant to liberation theology.

Time

Time is the single most pervasive component of our experience and the most fundamental concept in our physical theories. For these reasons time has received intensive attention from philosophy. Reflection on our ordinary-tensed language of time has led many to posit a relation of metaphysical importance between time and existence. Closely connected with such intuitions are claims to the effect that time is unlike space, and in deep and important ways.

The development of physical theories from Newtonian dynamics through relativistic theories, statistical mechanics, and quantum mechanics has had a profound effect on philosophical views about time. Relativity threatens the notion of a universal, global present, and with it the alleged connections of time to existence. The connection between temporal order and causal order in relativity theories, and between the asymmetry of time and entropic asymmetry in statistical mechanics, suggest various 'reductive' accounts of temporal phenomena.

Finally, the radical differences between time as it appears in our physical theory and time as it appears in our immediate experience, show important and difficult problems concerning the relation of the time of 'theory' to the time of 'our immediate awareness'.

1 Time and existence

There is much philosophical debate about the degree to which the temporality of the world is like or unlike its spatiality. All agree that space and time differ in their dimensionality, and all agree, even in a relativistic context, that the temporality of the world is not a spatial dimension. Spatial and temporal aspects of the world are, for example, differentially interconnected with causal features.

One aspect that distinguishes time from space is the intuitive asymmetry of the former, unmatched by any related feature of the latter. While there is debate about what this asymmetry consists in, and how it is connected to other features of the world such as entropic asymmetry, there is not much question that it is uniquely characteristic of the temporal structure of the world (see Thermodynamics §§4-5).

But that distinction alone is often thought insufficient to capture the special nature of time. Expressions such as the 'flux' or 'flow' of time are often invoked metaphorically to capture what is intended, as in Bergson's treatment of temporality (see Bergson, H.-L. §2). McTaggart (1934) distinguished between those aspects of time that could be characterized using timeless temporal relations (such as one event being after another), called by him the B-series, and those aspects of time that were expressed in tensed discourse, called by him the A-series. It was McTaggart's contention that only the A-series captured the essence of temporality, but that since this essence was self-contradictory, time was 'unreal' (see McTaggart, J.M.E. §2).

The core of such claims lies, perhaps, in the intuition expressed by St Augustine that while being elsewhere than here hardly reduced the reality of an object, that which was not presently existing had no genuine existence at all (see Augustine §6). Other versions of this line take it that only past and present have 'determinate reality', the future, not yet having come into being, having no genuine determinate reality at all.

An important response to such ideas argues that there is no ultimate distinction in 'reality' between the present as contrasted with the past and future or between the present and past as contrasted with the future. This approach admits that past and future do not 'exist', of course, if 'exist' is being used in its tensed form, but finds in that only an interesting feature of natural language (having tensed-verb forms but no parallel structure for spatial location) and not anything of metaphysical importance.

McTaggart's claim that tensed expressions cannot be translated into tenseless ones, since the former have truth-values that vary with time and the latter do not, is admitted, but the proponents of the view that nothing metaphysical is represented by tense take it that this shows only that tensed discourse has an ineliminable 'token reflexive' or 'indexical' nature. To say '*x* occurred' is to say '*x* occurred before *now*'. 'Now' is a term whose reference varies with its use, since it refers to any moment of time at which it is uttered. Only this implicit indexicality, it is claimed, distinguishes tensed from untensed discourse, not some ability of the former but not the latter, to capture the essential metaphysical nature of time.

Those who reject this line offer several ways of trying to express what they think is missing in its account. Tense logics and models of splitting worlds (with the past as unique and the future as still offering manifold possibilities) are one approach. Others note the analogy with modal logic where the actual world is (in most accounts) metaphysically distinguished in its reality from the other possible worlds, much as the present is, allegedly, distinguished in its reality from other temporal moments of past and future (see Tense and temporal logic §5). The analogy goes only so far, however, since each moment of time is, when it is the present, the moment of reality. Formulating a full-fledged metaphysical perspectivalism that would capture the essence of the metaphysical claims of those who think time is specially connected with existence has proven a difficult task.

2 Relationism and its problems

Just as in philosophical explorations of space, the idea that time can be considered as nothing but a structured family of relations of material events is an important one (see Space §3). The doctrine is, perhaps, already implicit in Aristotle's description of time as 'the measure of motion' and becomes explicit in Leibniz's full-fledged relationism for space and time (see Leibniz, G.W. §11).

One question that immediately arises in a relationist perspective is whether there could be passage of time without change (see Change §2). One response to this is to introduce modality into the discourse. Just as empty space can be thought of as given by unactualized possibilities of spatial relations, so one might think of time intervals without actual change as given by possible but not actual changes. Important insights are contained in Shoemaker's notion of limits to situations themselves relationally acceptable (such as the limit of a sequence of ever-larger regions of the universe that abide without change) (Shoemaker 1969).

Newton introduces novel elements into the philosophical discussion in his insistence on 'absolute time' to accompany space as reference frame for absolute inertial motions (see Newton, I. §3). Many relationists like to think of the time interval as being arbitrarily specified by any periodic process. Newton emphasizes the distinction between the ideal process and any actual one. More importantly his theory, with its notion of distinguished absolutely uniform motions, presupposes that uniformity of time interval is fixed by physical processes other than arbitrarily chosen periodic processes. Without an absolute notion of equality of time interval the absolute notion of uniformity of motion is incoherent.

Within contemporary relativistic theories the issue of the adequacy of a relationist account of time becomes absorbed into the more general issues concerning the opposition between relationistically and substantivally interpreted spacetime theories (see Relativity theory, philosophical significance of §§5-7).

3 Time in relativistic theories

The introduction of the novel conceptualization of space and time forced upon us by the theories of special and general relativity once again illustrates the crucial interdependence of philosophical and physicist thought in this area.

In the special theory of relativity, the notion of simultaneity for events spatially separated from one another, and with it the time interval between any two separated non-simultaneous events, becomes relative to a chosen inertial reference frame (see Relativity theory, philosophical significance of §2). There is no longer a global 'now' that selects one and the same set of events for all observers, no matter what their state of motion relative to one another. Such a relativization of the notion of time is not to be confused with the relationist conception of time described above. With the advent of special relativity one has the beginning of the radical divergence between our intuitive notions of time and those posited by physical theories.

It is often claimed that within the relativistic picture the doctrines that connect existence with temporality (as discussed above) are no longer viable. If what is present and what is past can vary from observer to observer, then how can one maintain that past and future (or, alternatively, future alone) have no genuine reality? A frequent claim is that relativity forces upon us the view of the timelessness of existence contrasted with the 'essentially tensed nature of existence' theories.

As is so often the case, however, such an inference from physics to philosophy is premature. One could, for example, relativize one's notion of existence, thus claiming that past and future are unreal, but that events unreal

for one observer can be real for another observer itself real to the first. Alternatively, one could utilize only invariant spacetime features in the account. In one version of this approach the past remains real at a spacetime point-event, in the sense of the past light-cone at the point-event constituting the real (see Relativity theory, philosophical significance of §1). In another version reality is collapsed even more radically than in the Augustinian view, so that what is real at a place-time is only that unextended point place-time and its features.

General relativity, with its dynamic spacetime, makes matters even more peculiar. Models of the world in this theory exist with closed timelike curves. In such a world an event can be (globally) in its own past and future (see Time travel). Such possibilities led Kurt Gödel (1949) to assert that time was 'ideal' and that the '*t*' parameter of physics did not stand for time at all.

4 Time and causation

Various claims have been made to the effect that time 'is defined by' or 'reduces to' some other feature of the world. Causal theories date back to Leibniz, who pointed out that simultaneity for events could be characterized by their not being causally connectable. The breakdown of this association in the special theory of relativity is often taken as the key factor in claims to the effect that distant simultaneity is a matter of convention.

The issue of the extent to which temporal notions are, or are not, causally definable in relativistic theories is a complex one. In the special theory there is a relation framed in terms of causal connectability that is coextensive with simultaneity. In general relativity causal definitions of temporal metric and topological notions utilizing causal connectability alone fail in general. But one can characterize topological spatiotemporal notions in terms of the continuity of causal (timelike) paths. This suggests a reduction of the spatiotemporal notions not to causal notions*per se*, but to the epistemically accessible topological features of the spacetime, those directly available to an observer (see Relativity theory, philosophical significance of §3).

Both the physical connections of spatial and temporal (and spatiotemporal) features to causal features of the world, and the philosophical understanding of what these might tell us about 'what time is' in the world, remain controversial issues (see Causation).

5 Time in experience and time in nature

Temporality enters our conceptual framework both as a descriptive component of our immediate experience and as a component of our theoretical description of the physical world. But how are these aspects of time related to one another? This would be a problem for philosophy even if we took the time of nature to have the features we think of time having prescientifically. Once we have been told by science that time in nature is radically unlike anything we encounter in our immediate experience, as we seem to be told in relativistic theories and as we are likely to be even more radically informed when a fully quantum mechanical account of spacetime is forthcoming, the problem of relating experienced time to the time of theory becomes even more pressing.

One tradition starts from the time of our immediate experience and suggests that the time of nature is in some way or another a construct dependent on the time of conscious awareness. A seminal version of this approach is the treatment of time in Kant (1781/1787). Time is, along with space, one of the structuring principles of all experience, called by Kant, a pure intuition. As such it is a feature of the phenomenal world and not of 'things-in-themselves'. Both outer experience of physical objects and inner experience of psychological states are framed in the format of the temporal intuitive structure. Behind the temporal psychological self is the transcendental self, that which unifies all our experience with its implicit 'I think'. Non-temporal, the transcendental self is the ground of the temporal structuring of physical and psychological experience (see Kant, I. §§5-7).

The idealist tradition is continued in Husserl's phenomenological account of the ground and nature of our experience of time (1928). Here emphasis is placed on what the necessary features of such experience must be like in order that we experience things as past, present and future, and have the sense that we do of time as passage. In Heidegger's pragmatist-phenomenology, time as it functions in human activity is the ground of time altogether (see Heidegger, M. §§1-2). One begins with time as it appears in our experienced world of the fixed past, the present of action and the future of projected intentions. The time of nature and science, the time of the 'present-at-hand', is only derivative from the primordial time of experience as decision and action. In these

(external, transcendental) idealist accounts of time, the time of past, present and future is taken as central.

Contrasted with such approaches is that of the physicalist-naturalist, to whom the time of the physical world is basic and the time of human experience supervenient at best. In these accounts it is the timeless temporal relations of the B-series that are usually taken as fundamental. Time in experience is usually thought of in something in the vein of a secondary quality.

But even such naturalistic accounts have their problematic aspects. Any proposal to make time as experienced a mere secondary quality (such as that of Gödel noted above), and that takes the '*t*' of physics to be a parameter disconnected from time as we immediately encounter it, leaves little ground for understanding how physical theories can receive a realistic (as opposed to instrumentalistic) interpretation, or for theoretical realism in general (see Scientific realism and antirealism §1).

Time travel

The prospect of a machine in which one could be transported through time is no longer mere fantasy, having become in this century the subject of serious scientific and philosophical debate. From Einstein's special theory of relativity we have learned that a form of time travel into the future may be accomplished by moving quickly, and therefore ageing slowly (exploiting the time dilation effect). And in 1949 Kurt Gödel announced his discovery of (general relativistic) spacetimes whose global curvature allows voyages into the past as well. Since then the study of time travel has had three main strands. First, there has been research by theoretical physicists into the character and plausibility of structures, beyond those found by Gödel, that could engender closed timelike lines and closed causal chains. These phenomena include rotating universes, black holes, traversable wormholes and infinite cosmic strings (Earman 1995). Second, there has been concern with the semantic issue of whether the terms 'cause', 'time' and 'travel' are applicable, strictly speaking, to such bizarre models, given how different they are from the contexts in which those terms are normally employed (Yourgrau 1993). However, one may be sceptical about the significance of this issue, since the questions of primary interest - focused on the nature and reality of the Gödel-style models - seem independent of whether their description requires a shift in the meanings of those words. And, third, there has been considerable discussion within both physics and philosophy of various alleged paradoxes of time travel, and of their power to preclude the spacetime models in which time travel could occur.

1 Paradoxes of time travel

The simplest (and weakest) of the alleged paradoxes is the argument that time travel would permit 'changing the past', which would be a patent absurdity. Suppose, for example, you were *not* at the Battle of Hastings. If time travel were possible, it would seem that there would be nothing to stop you from going to the Battle, thus bringing about a contradiction with what was the case, namely, with your not having been there. However, this apparent problem is removed by recognizing that time travel would merely allow one to *influence* the past - to help make it what it was - but not to *change* it. Thus, if you were at the Battle, this fact would be a consequence of your present decision to travel back in time; and if you were not there, this would be because you now freely choose not to go, or fail to arrive for some other reason. Either way there is nothing that deserves to be called 'changing the past' and nothing contradictory.

But there are related problems, not so easily dismissed: most notoriously that time travel would appear to open the door to 'killing one's infant self'; or, more generally, to going back and doing something that one has strong present evidence was not done; or, even more generally, to producing a self-defeating causal chain - a closed string of events in which the occurrence of E at some particular spacetime point has a looping sequence of effects eventuating in the absence of E at that very point. It might be argued that since: one, such chains are evidently self-contradictory, and since, two, their possibility is entailed by the possibility of time travel, it follows that time travel is impossible. But in this formulation the allegation of paradox is unpersuasive, since premise two may well be denied. For it need not be conceded that in countenancing the prospect of time travel, hence of *some* closed causal chains, we necessarily become committed, in addition, to the possibility of self-defeating logically impossible chains (Lewis 1986).

An alternative formulation of the puzzle raised by these examples focuses on certain physical anomalies that would be associated with time travel, given the logical inadmissibility of self-defeating chains. For example, repeated attempts to commit autoinfanticide would have to be constantly yet inexplicably frustrated by unfavourable circumstances (such as memory lapses, gun jammings, brilliant surgeons on hand, and so on), which would add up to a peculiarly extreme coincidence; but we have empirical reason to believe that such a coincidence would never occur in our world; so we can infer that regular time travel will not take place. Not that such a thing is logically or conceptually impossible, but rather that what we see of our world (in particular, that massive coincidences do not happen) provides evidence against its occurrence (Horwich 1989).

2 Implications for the character of spacetime

Could some such argument show, in addition, that spacetime does not have the sort of structure (containing closed timelike lines) that is needed for time travel into the past? Not according to Gödel. He reasoned that the

mass-energy required for such trips would be so immense (Malament 1984) that they could never become technologically feasible; and so we should not think that if we were really in a Gödelian spacetime, we ought to be encountering the kind of anomaly (massive coincidences) that we do not in fact observe.

But this reasoning has been questioned by De (1969) who considers electromagnetic energy sources that Gödel did not take into account. Moreover one might suspect that a version of the autoinfanticide argument could be developed that does not depend upon things being transported back into the past. For it would seem that the existence of closed timelike lines, and the requirement that the causal chains located on them not be self-defeating, will together imply certain constraints on the distribution of matter (on the constituents of the chains) - constraints which we might observe to be violated. The idea, again very crudely, is that of all the otherwise possible 'initial conditions', only a restricted subset would, given our dynamical laws, be capable of 'causing themselves', and thereby avoiding the production of self-defeating chains; but insofar as we observe no such restriction, it would follow that our world could not contain closed causal chains.

3 Open questions

Although suggestive, this line of thought stands in need of considerable development in various directions. For it is as yet unclear what exactly the constraints implied by closed timelike curves would be, whether their severity is or is not substantially increased by the supposition of the special type of closed causal chains that embody human voyages into the past, and whether we do or do not have reason to believe that the constraints are violated. These are hard questions even to formulate precisely, let alone answer. Thus the topic of time travel promises to remain puzzling and vibrant for some time to come.

Timon (*c*.315-*c*.225 BC)

Timon was a Greek philosopher-poet. The formative influence on his life was his meeting with Pyrrho, who was later hailed as the founder of Scepticism. He devoted his literary talents to eulogizing Pyrrho, and his satirical vigour to criticizing other philosophers. He, more than anyone else, carved the image of Pyrrho into what was to become its traditional form and placed it on its pedestal. In this, Timon seems to have been not only a fervent propagandist but also a major philosophical figure, exerting a decisive influence on the history and the very definition of neo-Pyrrhonian scepticism.

Timon was born in Phlius around 315 BC, dying in Athens around 225 BC (this chronology revises the traditional dating forwards by a decade, lengthening Timon's potential acquaintance with the philosophical debates of Hellenistic Athens). What evidence we have portrays him as cultivated, spiritual, a *bon vivant*, a caustic wit, absent-minded and unselfish. According to Diogenes Laertius (IX 109-16) he had a colourful life, full of ups and downs. Orphaned early, he first became a dancer, then lived at Megara, where he worked with the philosopher Stilpo (see Megarian School). His meeting with Pyrrho transformed his life and thought: he moved with his family to live close to Pyrrho, where he remained for twenty years. After Pyrrho's death, material problems flung him into an itinerant life, but his manifold talents in the end won him wealth and renown. He ended his days in Athens. There the Platonic Academy had just passed into the hands of Arcesilaus, and it was by contrast with the type of scepticism which Arcesilaus represented that Timon set out to define Pyrrhonian scepticism (see Academy).

Timon was quite unlike Pyrrho in that he was a prolific, versatile and talented writer. According to Diogenes Laertius (IX 110), 'the leisure which he snatched from philosophy he devoted to composing poetry.' He must have snatched a lot of it, because he wrote epics, dozens of tragedies and comedies, his *Silloi*, and prose works totalling 20,000 lines. The *Silloi* (that is 'Mockeries' - the original meaning of the word is disputed) are the least unknown of his works. Of these we possess sixty-six fragments (some very short) and a synopsis. Taking up the literary genre of parody (mainly of Homer) already made familiar by Xenophanes and the Cynic Crates of Thebes (see Cynics §3), Timon turned the mockery onto dogmatic philosophers. In the last two of the poem's three books, he portrayed himself - probably under the fictional guise of a descent to Hades - in conversation with Xenophanes, first about early philosophers, then about recent ones. The surviving fragments confirm that the style was parodic, and show the precision with which he aimed his barbs. More than thirty philosophers are mentioned, from the Presocratics down to Timon's contemporaries, each spiced with jokes of greater or lesser piquancy (and greater or lesser intelligibility to us). Only Pyrrho is unreservedly eulogized. Xenophanes, owing to his sceptical tendencies (see Xenophanes §5), occupies a privileged place: he is an interlocutor and guide, and perhaps intercedes on behalf of some philosophers who are treated with relative leniency (the Eleatics, Democritus, Protagoras). Even so Timon, not without malice, makes him say that in his old age he ended up himself falling back into dogmatism. This gallery of philosophers and the accompanying comments certainly played a leading role in the process by which Pyrrhonism defined itself (see Pyrrhonism), establishing its own pedigree and locating itself relatively to those philosophies with which it had affinities and differences.

Beyond the primarily critical *Silloi*, Timon wrote another philosophical poem, the *Indalmoi* ('Images'), apparently the constructive part of his programme for exalting, if not deifying, the moral figure of Pyrrho. His prose works are even less well known. The most important seems to have been the *Python*, where Timon's meeting with Pyrrho was ceremonially depicted, and where the pupil, in a restrained tone, expounded the main outlines of his master's work. This last work is probably the source of a summary of Pyrrho which Aristocles attributes to Timon, and which is undoubtedly the most important text in the entire doxography of Pyrrho (§3). Treatises by Timon titled *On Sensations* and *Against the Physicist* are also cited: remains of these works show that this master of mockery could discuss technical philosophical questions with the utmost seriousness.

Timon's place in the history of Pyrrhonian scepticism gave rise to disagreements in antiquity (Diogenes Laertius, IX 115). According to some, the 'succession' of teachers and pupils continued without interruption from Timon down to the Neo-Pyrrhonism we know from the writings of Sextus Empiricus (*c*. AD 200). Others, more plausibly, held that the line was broken after Timon and renewed later. It would be especially interesting to know whether Timon himself was merely Pyrrho's 'spokesman' (Sextus' description of him in *Against the Professors* I 53),

however effective and brilliant, or whether he left his own mark on the image he projected of his master's thought. Since Pyrrho wrote nothing, and is known through testimonies which depend, directly or indirectly, mainly on Timon, the answer can only be conjectural. In the summary reported by Aristocles, some details seem to imply that Pyrrho's own aim was exclusively or primarily ethical, and that it was Timon who imposed on him a sort of epistemological distortion. That would make Timon in effect the first of the Neo-Pyrrhonians. Even if one simply reflects on Timon's location (in both time and space), interests and personality, it will seem most unlikely that he was a mere clone of Pyrrho.

Tindal, Matthew (1657-1733)

Matthew Tindal was one of the last and most learned exponents of English deism. His most famous work is Christianity as Old as the Creation (1730), a comprehensive apology for natural religion. In it, he argued that God's law is imprinted on the nature of all things, including the human soul, and is accessible to reason. Revealed religion merely restates this universal law - the will of God - in a different form. Religion enables us to act in accordance with this natural order, and its end is happiness. However, Tindal was scathingly critical of the clergy, and cast doubt on the reliability of the Bible. Although Tindal's work was severely criticized by William Law, it exerted a considerable influence on the English and Continental Enlightenment.

1 Life and work

Born in Bere Ferrers in Devonshire, Matthew Tindal was brought up in the High-Church tradition of his father, the local parish priest. In 1673, he matriculated at Lincoln College at Oxford, where he was tutored by George Hickes, a High-Churchman. He later moved to Exeter College. He was elected a Fellow of All Souls in 1678 and was made a Doctor of Civil Law in 1685.

Tindal's England was deeply divided along political and religious lines. Theological controversies between Catholics and Protestants were further complicated by the self-confidence of reason, the claims of natural philosophy, and a rising interest in textual criticism. Like John Chillingworth and Pierre Bayle, Tindal went through a short Roman Catholic phase. But craving for freedom of thought, he returned to Protestantism in early 1688, eventually disencumbered of High-Churchism. At the time of the Glorious Revolution, Tindal rallied to William III, championed Whig opinions and discovered affinities with Low-Churchism. His early publications - *An Essay Concerning Obedience to Supreme Powers* (1693) and *An Essay Concerning the Laws of Nations, and the Rights of Soveraigns* (1694) - were concerned with legal matters. An unmitigated assault on episcopacy, *The Rights of the Christian Church Asserted*, caused a considerable stir in 1706 and established his reputation as a freethinker. In spite of a *Defence* (1707-8), the book was condemned by Parliament in 1710 and burned by the hangman. By then his offensive against the High-Church party had gathered pace with *A New Catechism, with Dr. Hickes's thirty nine Articles* (1710).

The first volume of *Christianity as Old as the Creation or, the Gospel, a Republication of the Religion of Nature* came out in 1730, ending two decades of quiet. Inspired by Cicero's *On the Nature of the Gods* and *On Divination* (see Cicero §3), Tindal's dialogue on religion, though repetitive and crammed with innumerable excerpts from Latitudinarian and rationalist divines, is typically in both argument and style the work of a mature and aged scholar. The second volume, though completed, was never published. The executor of Tindal's will was delinquent and the manuscript vanished. The first volume, Tindal's masterpiece, was a synthesis of the deist argument developed over a century by Herbert of Cherbury (§§3-4), Charles Blount, John Toland, Lord Shaftesbury (§2), Anthony Collins (§1), Thomas Chubb and Thomas Woolston (see Deism). After Tindal's death in 1733, it was hailed as the Bible of the deists, and in 1741 it was translated into German. It spurred the Enlightenment; Reimarus, Lessing and Kant (§14) are indebted to Tindal for their understanding of natural and revealed religion. In France, the *philosophes* revelled in Tindal, whom Voltaire (§2) praised as the most intrepid defender of natural religion. Jacques-André Naigeon was, however, not permitted to publish an abridged translation in French before 1770.

2 The religion of nature

It was the ambition of deism to define a creed, minimalist and natural, that might provide a common basis for belief, upon which theologians and natural philosophers would agree regardless of their denomination. In promoting the religion of nature on the basis of 'a Law of Nature, or Reason… a Law which is common, or natural, to all rational creatures' ([1730] 1995: 7), Tindal, a rationalist in principle, pursued a threefold objective: the reconciliation of Christian revelation with human rationality, the settlement of religious conflicts, and the establishment of religious freedom and toleration. Beyond its theological and cultural aspects, the construction of a philosophical religion responded to a social and political need of the time.

In order to solve problems that the Latitudinarians (who advocated an alliance of Christian theology with reason)

were among the first to perceive, Tindal postulated the innateness of religion. A law is imprinted on the human soul by virtue of creation and can be known by reason regardless of historical and cultural circumstances. This law is the will of the supreme legislator, the creator of the universe. Borrowing a key ontological principle from Samuel Clarke (§1), whose Boyle Lectures were emblematic of a rationalist age, Tindal enunciated the view that God's will was entrenched in 'the Nature and Reason of Things' ([1730] 1995: 56), in the immutable relations governing nature. The possibility of religion in general, and natural religion in particular, is established on a rationalist ontology.

But if true religion is a priori, natural and universal, should Christian belief not be dispensed with? The anthropomorphisms propagated by the Judaeo-Christian scriptures were as revolting to Tindal as the arbitrariness of a God who selected a miserable and ignorant tribe and demanded that human beings believe in magical phenomena and acknowledge absurd doctrines in order to receive the benefits of salvation. None the less, since Tindal aimed at bringing the Judaeo-Christian God and the God of deism into harmony, he espoused a hypothesis which has since become famous, namely that the a posteriori, revealed or historical religion was 'a Republication of the Law of Nature', 'a Restoration' or 'a Transcript of the religion of Nature' ([1730] 1995: 68, 176, 334; the first of these was originally a quote from Thomas Sherlock). This hypothesis had already gained some currency in seventeenth-century England owing to the sermons of Archbishop John Tillotson (1630-94) and Bishop Thomas Sherlock. Natural and revealed religion were 'like two Tallies… [which] exactly answer one another' ([1730] 1995: 51). It follows from this that Christianity is not a new religion, but, as the title of Tindal's book audaciously claimed, as old as creation.

Tindal's definition of true religion as 'plain, simple, and natural' ([1730] 1995: 241) is followed by six corollaries: (1) The sufficiency of natural religion. Natural religion is perfect: it originates from 'the Author of all Perfection' ([1730] 1995: 255); it is accessible universally; it discloses the divine will exhaustively; it allows for a reasonable worship; and it grounds revealed religion. (2) The equation of morality with nature. The law of nature expresses the will of God. All natural duties are summarized in the commandment to love God and our neighbour. (3) The equation of religion with ethics. Both Confucius and Jesus taught truths that encapsulated the substance of natural religion. Whereas morality is 'acting according to the Reason and Nature of Things considered in themselves', religion is 'acting according to the same Reason of Things consider'd as the Will of God' ([1730] 1995: 270). (4) Eudaimonia constitutes the purpose of religion. 'The ultimate End of all God's Laws, and consequently, of all Religion, is human happiness' ([1730] 1995: 90). (5) The difference between natural and revealed religion is reduced to a question of form. 'Natural and Revealed Religion only differ in the Manner of their being delivered' ([1730] 1995: 114). They are identical as regards the source of their being, namely the divine will, but distinct as regards the way in which they are known. Natural religion is known rationally, revealed religion historically. (6) The distinction between true religion and superstition. True religion deals with ends and prescribes means. What is concerned with matters irrelevant to morality is called superstition.

3 Polemical deism and its opponents

In the wake of Collins' *Priestcraft in Perfection* (1709), Tindal launched a veiled attack against the clergy, the Bible and the external evidences of Christian belief. He stigmatized the power of priestcraft and the evils of religious enthusiasm by ridiculing the customs, rites and mores of heathens and Jews. The clergy is charged with bigotry, fraud and cruelty. Self-serving Christian priests teach absurdities, impose arbitrary duties and foster superstition. Subjecting the Judaeo-Christian scriptures to the critique of reason, Tindal drew attention to a collection of scriptural problems that the nascent biblical criticism was beginning to exhume (see Hermeneutics, biblical §2). Not only did he cast doubt on the authority and reliability of the Bible, but he also disparaged the allegorical and typological interpretations of the Anglican tradition. The refutation of the external proofs of revealed religion had been a main feature of deism since John Toland. Seeking to eliminate from Christianity teachings that were either against or beyond reason, Tindal listed miracles among those things that can only nurture superstition. 'If you look no further than the Christian World, you will find, that Ignorance, and the Belief of daily Miracles go hand in hand; and that there's nothing too absurd for the Peoples Belief' ([1730] 1995: 192). Tindal's offensive against Christian orthodoxy anticipated d'Holbach's *Christianity Unveiled* (1756), which provided Feuerbach's and Marx's critiques of religion with their main arguments (see Feuerbach, L.A. §2; Marx, K. §3).

Tindal's natural and ahistorical rationalism resulted in a sophisticated moral elitism which cut right across doctrinal and ecclesiastical boundaries, but at the huge cost of an unsophisticated anticlericalism, antibiblicism and anti-Judaism. There were not many replies to his polemical book. In 1731, Daniel Waterland unsuccessfully tried to vindicate the Old Testament picture of God in an anonymous *Scripture Vindicated*, while William Law more successfully exculpated the God of orthodoxy from the charge of arbitrariness in *The Case of Religion and Reason, or Natural Religion, Fairly and Fully Stated* (1731). Law further blamed Tindal for failing to see in human beings the importance of both irrationality and evil.

Tocqueville, Alexis de (1805-59)

Tocqueville once observed that his temperament was the 'least philosophical' imaginable. He meant that his mind was governed by passionate commitment, a determination to defend civil and political liberty against threats resulting from social levelling and the growth of state power. Thus, Tocqueville's most famous work, De la démocratie en Amérique (Democracy in America) (1835, 1840), did not spring from detached curiosity about US institutions. It was rather an attempt to draw lessons from US society and government which could be used to reform French institutions. His belief in local autonomy - he called the New England township a 'school for citizens' - led him to develop a distinctive conception of liberty that combined elements of ancient citizenship and modern autonomy. That conception also shaped his own political career and later writings. In L'Ancien régime et la révolution (The Old Regime and the French Revolution) (1856) Tocqueville traced bitter class conflicts in France to the destruction of local autonomy long before 1789.

Tocqueville was the child of aristocratic parents who had nearly died on the scaffold in the Reign of Terror. His childhood was overshadowed by stories of relations who did not escape, including his famous grandfather, Lamoignon de Malesherbes - the pre-Revolutionary reformer and critic of royal despotism who became the young Tocqueville's hero. The sense of danger surrounding an aristocratic family after the Revolution left a profound mark on the boy. But that sense was strengthened by political developments in France during the Restoration (1815-30). The advent of a reactionary ultra-royalist government in the 1820s gradually convinced Tocqueville that it was not only futile but unjust to resist social change. He learned from a group of Restoration liberals called the *Doctrinaires* to consider the long-term movement from an aristocratic to a democratic social order - the 'Democratic Revolution' - as 'irresistible' and 'providential'. But that is not all he learned from the *Doctrinaires*. After completing his legal studies and becoming a junior magistrate, Tocqueville attended lectures by the historian François Guizot which deepened his understanding of two potentially dangerous consequences of the democratic social revolution in France, what the older Royer-Collard had called 'atomization' and 'centralization'.

These concepts shaped Tocqueville's intellectual development after 1828. By 'atomization' he understood the threat to association which resulted from the destruction of a corporate society, leaving a society in which individuals are equal but isolated and equally weak. The beneficiary is the state with its claim to a sovereign right which can be used to justify an indefinite concentration of power at the centre, controlling the periphery of society through a bureaucratic machine. Restoration liberals had begun to invoke a 'new federalism' to meet this threat and establish a balance between central power and local autonomy. Guizot, in particular, had criticized the concept of sovereignty passed down from Bodin and Hobbes, with its stipulation of a monopoly of authority in one agency (see Sovereignty).

Tocqueville evidently found the new liberal prescription tantalizing but vague - for would not local autonomy lead to the dissolution of the state through the emergence of competing 'sovereigns'? Such questions probably helped to direct his attention to the USA. Restoration liberals had laid emphasis on the role of class conflict between the aristocracy and middle classes in explaining why power had been centralized in France under the *ancien régime*. Tocqueville began to wonder if US political institutions might have a didactic potential because they had developed in a society which had been democratic from the outset.

The journey Tocqueville and his friend Beaumont made through America in the years 1831-2 confirmed this suspicion. US federalism embodied a balance between central power and local autonomy that enabled Tocqueville to complete the critique of the concept of sovereignty by demonstrating that political unity did not entail administrative centralization. But observation of the vibrant life of townships in New England led him beyond his initial concern with dispersing power into a new conception of liberty - what he was to call 'free *moeurs*', or the attitudes and habits of a free people. In that way Tocqueville stepped outside the confines of late eighteenth- and early nineteenth-century liberalism, with its emphasis on constitutionalism and legal rights. Instead, social attitudes became the focus of his concern. But while seeking to analyse and defend the civic spirit or citizenship which local participation fostered in the USA, Tocqueville also sought to avoid the drawbacks of a concept like Rousseau's general will (see General will).

In his *Du contrat social (The Social Contract)* (1762) Rousseau had defined active citizenship and concern for the

general welfare into a concept of real or moral freedom (the general will) which might conflict with the *de facto* wishes of individuals (see Rousseau, J.-J. §3). At the outset of the Restoration, Benjamin Constant (§1) had argued that Rousseau's defence of citizenship or ancient liberty had sacrificed the most important modern meaning of liberty; that is, individual autonomy protected by rights. Restoration liberals such as Constant charged Rousseau with creating a concept which could serve as a weapon of tyranny. They had in mind especially appeals to the 'will of the people' which had been used during the Reign of Terror to justify the sacrifice of individual liberty. Consequently they looked upon arguments for political participation with suspicion, if not with hostility. Tocqueville, after his journey through America, stood out against that trend. What he had observed about local autonomy persuaded him that it had a crucial moralizing potential. What is striking about the argument of *De la démocratie en Amérique (Democracy in America)* (1835, 1840) is that instead of tying political participation to 'correct' political decisions by definition, Tocqueville put forward a concept of free *moeurs* - the attitudes and habits of a people by self-reliance and the habit of association - which makes the moralizing process probable rather than necessary. In that way Tocqueville 'rescued' the value of citizenship by reconciling it with individual autonomy or rights in an unambiguously liberal doctrine of citizenship (see Citizenship §2).

The success of *Democracy in America* was stunning. It helped to launch Tocqueville into a political career. Yet the 1840s turned him into a sad and frustrated critic of Louis Philippe's July Monarchy, with its cynical manipulation of the limited franchise. Tocqueville's greatest political prominence came after the revolution of 1848, when he served briefly as French foreign minister. But it was a short-lived success. For Louis Napoleon's *coup d'état* (1859) and the Second Empire obliged Tocqueville to withdraw into a kind of internal exile. He would not serve a tyrant. Instead, he devoted his final years to showing how the bureaucratic French state and class hatreds had developed together in a vicious alliance. The structure of argument in *L'Ancien régime et la révolution (The Old Regime and the French Revolution)* (1856) remained essentially the same as that of *Democracy in America*. Tocqueville's insistence on the importance of decentralization and political participation made him a liberal moralist of a new kind. In his view, liberalism could not safely confine itself to an interest in market relations or legal structures. Fostering the virile attitudes of a free people was all-important. Sad but unswerving in his opposition to tyranny, he died in 1859.

Todorov, Tzvetan (1936-)

Tzvetan Todorov is a Bulgarian thinker and literary theorist who lives and works in France. His thought is 'structuralist' in that it seeks stable abstract principles explanatory of, but not directly given in, phenomena of literature and history. His thought is not only a milestone in the history of structuralism but is 'negatively' important to the development of post-structuralist thought: the rules and oppositions conveyed by structuralist typologies such as those of Todorov constitute much of what thinkers such as Jacques Derrida seek to 'deconstruct'.

Tzvetan Todorov was born and received his early education in Sofia, Bulgaria. At the age of 24, he moved to France, where he is (1996) Director of Research at the Centre National de Recherches Scientifiques in Paris. He has also taught at the University of Paris and at several American universities, among them Columbia and Yale. In addition to broader, more 'philosophical' works, he has published important studies on Rousseau, Goethe and Bakhtin. He has also edited a number of anthologies, including the *Dictionnaire encyclopédique des sciences du langage* (1972).

Todorov's earliest works (1968, 1971, 1978b) concern the study of literature, which he divides into two parts: 'poetics', which seeks the abstract structures governing literary genres, and 'interpretation', which concerns the meaning of individual texts. Poetics, for its part, is 'objective' and 'scientific'; its central concept, that of genre, plays a role in it akin to that of species in biology. 'Interpretation' is more subjective: while some interpretations can be wrong, none is ever the only correct one.

Todorov's poetics explores three basic aspects of the literary text: semantic, syntactic and verbal. Unlike traditional semantic units (for example, sentences), the literary work is 'dialogical' or 'intertextual': it refers, not merely to non-literary states of affairs, but also to prior and posterior texts (including earlier and later stages of itself). As fictional, or 'feigned' speech, it claims, not truth, but verisimilitude: accordance with the rules of its genre and with the expectations of its readers, or 'public opinion'. Following Russian formalists such as Mikhail Bakhtin, Vladimir Propp and others (see Bakhtin, M.; Russian literary Formalism), Todorov argues that the 'syntactic' order of the literary text is not grammatical, but narrative: the events narrated follow each other in a logical order ('mythological' narrative) or contribute to the manifestation of a single idea ('ideological' narrative). Its 'verbal' aspect is the way in which it enables the reader to construct a fictional world and includes the text's use of time, perspective and voice. None of these aspects, of course, is limited to what we call 'literature': all are widespread in many types of discourse. Hence no structural definition of literature is possible (1978b: 11). The proper object of literary theory remains the genre.

But a literary genre differs crucially from a biological species:

> The impact of individual organisms on the evolution of the species is so slow that we can discount it in practice. …[But] we grant a text the right to figure in a history of literature or of science only insofar as it produces a change in our notion of one activity or the other.
>
> (1970: 6)

Hence, poetics by itself is incomplete, and must be supplemented by the interpretive investigation of individual works. Todorov's most extended pursuit of such investigation can be found in *The Fantastic* (1970). His main historical account of it is in *Theories of the Symbol* (1977), which investigates the development of the modern or 'romantic' conception of the symbol, in which the work of art no longer 'imitates' reality but functions according to its own inner logic (thus making poetics itself possible). Finally, *Symbolism and Interpretation* (1978a) undertakes a general typology of interpretive strategies.

The rules which a work of literature obeys - those of its genre and of its own intertextuality - are not thought up by its author: they are beyond authorial control. Such a text is thus governed by elements which may be called foreign to it. If allowing foreign elements to dominate one's own thought and work is 'primitive', then as early as *Theories of the Symbol* Todorov is engaged in 'identifying the supposedly primitive mechanisms in our own thinking' (1977: 223). Structuralist poetics is thus from the start an enquiry into the otherness always resident in our own thought. By the time of *Literature and its Theorists* (1984), the theme of alterity has become 'the focal point of

[Todorov's] work' (1984: 3). Together with this new emphasis on alterity goes a shift in interest from literature to history.

The most important document in this shift is Todorov's *The Conquest of America* (1982). In this classic work, Todorov undertakes to examine the ways in which the European conquerors of America thought about its pre-Columbian inhabitants. The book is not, then, a 'theory' of anything. Rather, it recounts an 'exemplary narrative' with ethical meaning (1982: 4). The aim is not merely to understand the practices of the *conquistadors*, but to change those aspects of contemporary culture which exhibit their vestiges: 'to become aware of the relativity (hence the arbitrariness) of any feature of our culture is already to shift it a little' (1982: 254).

But the book retains a 'typological perspective' (1982: 252); the typology in question is developed in *On Human Diversity: Nationalism, Racism, and Exoticism* (1989). There are, it argues, three main ways to handle the empirical fact of human diversity. One is ethnocentrism, which simply generalizes characteristics of one's own society into 'universal' values. A second, more respectable today, is 'scientism': the scientific examination of human beings will teach us what they should pursue and avoid. Both are dangerous: ethnocentrism inevitably arrives at the result that we should rule others, while scientism arrives at the rule of scientists. Apart from the 'indefensible' approach of complete relativism, which falls to a version of the sceptical paradox (1989: 389) (see Relativism), only 'critical humanism' is left. This sees liberty - the capacity to reject any determination of one's nature - as the central feature of humanity. The universalism to which it aspires is always open to revision, but - like truth itself - always there as a goal.

Toland, John (1670-1722)

Deist, freethinker and political republican, the Irishman John Toland's reputation is closely associated with the radical attack on Christian metaphysics and institutions in the Augustan period. His philosophical achievement was to turn the more erudite thinking of Spinoza, Hobbes and Locke into a popular polemic against the shibboleths of orthodox religious belief. In Christianity Not Mysterious (1696), burnt in Dublin by Parliamentary command in 1697, he exploited and extended the epistemology of Locke's Essay Concerning Human Understanding into a revision of Christian descriptions of the relationship between faith and knowledge, and a consequent defence of liberty of thought and belief.

Toland's contribution to philosophical developments can be traced to his scholarly training in the universities of Glasgow, Edinburgh, Leiden and Oxford in the 1690s. Skilful in languages and criticism, Toland forged his contemporary reputation as a figure of learning in the Republic of Letters. Associated at different times with powerful men such as John Locke, Anthony Ashley Cooper, the third Earl of Shaftesbury and Robert Harley in English society, and Prince Eugene of Savoy and Sophia of Hanover on the continent, Toland was a conduit for the diffusion of radical ideas across Europe. Controversial since his university days, he repeatedly found himself the subject of orthodox condemnation and hostility, whether publishing studies of apocryphal literature or defences of his political philosophy. The novelty of Toland's approach was to bring together and radicalize the achievements of a number of earlier philosophical positions.

As a pamphleteer and philosopher, Toland combined political radicalism with his heterodoxy: during the 1690s he was single-handedly responsible for publishing standard editions of the republican figures of the 1640s and 1650s, adapting the political philosophy of such commonwealthsmen as James Harrington to the exigencies of a monarchical constitution. Crucially, as his editorial work on the life and work of John Milton indicates, Toland made textual criticism (again adapted from the hermeneutical advances of Spinoza and the French Biblical critic Richard Simon) a tool of political and philosophical reform. Coiner of the neologism 'pantheist', Toland's private metaphysics (a combination of a Ciceronian neo-Stoicism, materialism and Spinozist ethics), disseminated in the Latin work *Pantheisticon* (1720), was a profound influence on the heterodoxy of the later French 'High' Enlightenment.

Christianity Not Mysterious (1696) was Toland's first major work. Premised on a combination of the epistemologies of Locke and Hobbes which emphasized the role of reason in the construction of knowledge, Toland argued that no Christian doctrine could be mysterious. Insisting that all theologies must be rational in order that every human being might understand them, Toland undercut the traditional Christian assertion that some doctrines (most obviously the Trinity for the Church of England) might be above the capacity of human rationality. Executing a historical examination of the meaning of the word 'mystery', Toland suggested that mysteries might be 'hidden' from human understanding rather than 'incomprehensible' to rational capacities. Toland's point, much vilified by Churchmen, was that no belief could legitimately be imposed by either Church or State on any individual. As Toland made clear in this and later works, the corrosion of the authority of clerical imposition in matters of interpretation was as much a political as a religious action.

Toland made the link between religion and politics in his series of canonical editions of commonwealth political philosophy in the 1690s. The works of Algernon Sidney, James Harrington, John Milton and Edmund Ludlow were adapted to the demands of eighteenth-century political culture in Toland's editions. Re-writing the millenarian language of Ludlow, or the puritanical idiom of John Milton, to the more civil demands of political discourse in the late seventeenth century was a skilled and long-lived achievement: Toland's editions remained canonical into the nineteenth century. In changing republican political philosophy from a programme of institutional reform into a language more suitable for a monarchical constitution, Toland placed the development of a civic theology and religion at the heart of his revision. 'Commonwealthsmen' pursued not the execution of all monarchs, but the imperatives of civic virtue. Protecting the safety of the people and advancing the cause of civic sociability were the central planks of this political philosophy. Importantly, making the connection between religion and politics, Toland, again adapting Harringtonian suggestions, insisted that public religion was the most effective way of establishing civic virtue.

As a corollary to his insistence that religion must be tuned to establish the harmony of civic communities, Toland embarked on a lifelong polemic against the corruptions and deviancies of priestcraft. His strategy was contrived as a deliberately public attempt to undercut the apostolic claims of clerical orthodoxy by establishing all religion as the manifestation of historical circumstance. Writing with a deliberately accentuated emphasis on his learning and skill, appropriating the scholarship of more orthodox authors, Toland, in works such as *Letters to Serena* (1704), suggested that key Christian doctrines such as the immortality of the soul were derived from 'heathen' origins. Similar essays on 'prejudice', 'idolatry' and the primitive church, stressed the continuities of all false religions: priests had ever corrupted the virtuous injunctions of natural religion. Pre-empting the naturalistic accounts of later thinkers such as David Hume and the *philosophes* of the Enlightenment, Toland established - importantly for a non-learned audience - that the ceremonial, doctrinal and institutional elements of all religions were culturally specific (see Enlightenment, Continental).

Drawing from the relativism implicit in such historical perspectives, Toland insisted that since there were no clear divine imperatives in favour of any one religious economy, all religions were equal. Concepts of religious truth were thus displaced for Toland by assessments of religious function. Good religion was focused on facilitating the values of civic community. Corrupt religion was a system calculated for the false private advantage of priests and kings. The high point of such arguments was to be found in Toland's *Nazarenus. Or Jewish, Gentile and Mahometan Christianity* (1718), a work first composed as a private, clandestine manuscript for the purview of Prince Eugene of Savoy. In the published work, using the device of a commentary on a suppositious gnostic work, the Gospel of Barnabas, Toland surveyed the historical relationships of Judaism, Christianity and Islam, concluding that as historical manifestations of specific cultural contexts the three religions were of equal value. Such an emphasis on locating the claims of religious truth in historical context has led some commentators to suggest that in Toland's works, and in the scholarly response to them on the continent, lie the origins of a modern *Textsgeschichte* identified in the Tübingen school.

Toleration

Toleration emerged as an important idea in the seventeenth century, receiving its fullest defence in John Locke's A Letter Concerning Toleration (1689). Initially developed in the context of attempts to restore peace in a Europe convulsed by religious conflicts, in the nineteenth and twentieth centuries it came to be extended to the accommodation of disputes about racial, sexual and social differences. Toleration is widely thought to be an essential element of a free society, especially one marked by moral and cultural pluralism, and it figures particularly prominently in the political theory of liberalism.

The paradigm example of toleration is the deliberate decision to refrain from prohibiting, hindering or otherwise coercively interfering with conduct of which one disapproves, although one has the power to do so. The principal components of the concept of toleration are: a tolerating subject and a tolerated subject (either may be an individual, group, organization or institution); an action, belief or practice which is the object of toleration; a negative attitude (dislike or moral disapproval) on the part of tolerator toward the object of toleration; and a significant degree of restraint in acting against it.

Philosophical arguments have mostly concerned: the range of toleration (what things should or should not be tolerated?); the degree of restraint required by toleration (what forms of opposition are consistent with toleration?); and, most importantly, the justification of toleration (why should some things be tolerated?).

1 Historical development

While intimations of the idea of toleration have been discerned in aspects of Ancient Greek, Roman and medieval thought, it was in sixteenth-century Europe that the concept began to emerge in a distinct and recognizable form (see, for example, the work of Jean Bodin); and in the seventeenth century that it became a crucial component in theorizing about how civil peace could be restored and maintained in a Europe riven by wars of religion. Althusius, Spinoza, Milton and Bayle were all important defenders of some conception of toleration. However, it is in John Locke's *A Letter Concerning Toleration*, first published anonymously in Latin in 1689, that the formulation and defence of the idea of toleration received its fullest statement.

Locke's arguments were addressed exclusively to the religious disputes of his time. Many of his arguments were based on religious or scriptural considerations and there was little in them that was entirely new. What Locke did, however, was to organize existing arguments into a coherent, powerful and principled defence of toleration. In particular, he emphasized the irrationality of religious intolerance, arguing that the attempt to coerce people into believing what they could not conscientiously assent to was both futile and destructive of the civil order. In Locke's view the prime function of government was to maintain civil order and public security: it was not the business of the government to save souls, for which it had neither the appropriate means nor the requisite expertise. However, where religious belief, or its lack, posed a genuine threat to civil order - for example, in the case of Catholics who owed their allegiance to a foreign power, or that of atheists who, in the absence of an effective threat of divine retribution, could not be trusted to keep their promises - intolerance was in principle entirely proper, although whether in fact it should be employed was a matter of prudential judgment (see Locke, J. §7).

Locke's argument for toleration was modest in its scope and cautious in its application. However, its central contention about the proper limits of government intervention in the lives of its citizens contained the seeds of a more expansive and positive conception of toleration. Both the ideas of the Enlightenment and the theory and practice of the US Constitution provided significant further support for toleration, especially for the toleration of heretical or unpopular ideas and opinions. Voltaire was a particularly influential publicist, being attributed with perhaps the most famous remark in defence of toleration: 'I disapprove of what you say, but I will defend to the death your right to say it'.

It is in J.S. Mill's *On Liberty* (1859), probably the most sustained and eloquent plea for toleration yet written, that toleration is wholeheartedly celebrated as part of a general defence of the value of liberty. Essentially, Mill argued for toleration on two grounds. First, he contended that it was a necessary condition for social improvement, intellectual progress and the growth of knowledge. Second, he claimed that it was required for the moral and

spiritual development of the individual. Toleration, therefore, is an essential ingredient of a good society, being both a means to social progress and a prerequisite for the development of individuality (see Mill, J.S. §12). Mill's arguments have been enormously influential for modern liberal theorists such as Ronald Dworkin, H.L.A. Hart, Joseph Raz and, more ambiguously, John Rawls.

Arguments for toleration have been important in removing religious disabilities, easing discrimination against minority groups and promoting a more permissive attitude towards differing life styles. Modern arguments about toleration invariably presume that some substantial element of toleration is essential to a free and democratic society and disagreement generally concerns where, and on what grounds, the limits of toleration should be drawn.

This is not to deny that any robust idea of toleration continues to have, as it always has, its opponents. The case against toleration has usually centred on the claim that it effectively condones immorality or undesirable behaviour; and that in doing so it undermines personal virtue and social cohesiveness. In relation to modern Western society, opponents claim that we have too much toleration, not too little.

2 The concept of toleration

Toleration is sometimes used loosely to mean freedom or liberty but is more accurately understood as a narrower concept. It is concerned specifically with permitting the expression of beliefs, actions or practices which the tolerator would prefer not to exist. Three components of the core concept of toleration can be identified. First, there must be some conduct about which the tolerator has a negative attitude. Second, this negative attitude must not be acted upon in ways which coercively interfere with others acting in the disapproved manner. Third, this refusal to interfere coercively must be more than mere acquiescence or resignation. Toleration is particularly important and problematic when it involves a principled refusal to prohibit conduct believed to be wrong. This gives rise to the so-called 'paradox of toleration' according to which toleration requires that it is right to permit that which is wrong.

Normally, one cannot be tolerant of something if one is either indifferent to it or approves of it. Acting tolerantly characteristically implies some sort of negative attitude or judgment on the part of the tolerator - ranging from mere dislike to intense moral disapproval - towards that which is tolerated. However, a tolerant disposition may also relate to the extent of the negative judgments. For example, to say that a person is tolerant may be to claim that they do not possess an inappropriate range or unjustified number of negative attitudes to the conduct of other people.

To describe a person or group as acting tolerantly standardly implies that they have the power to prohibit or interfere with that which they are tolerating, but choose not to do so. However, not all cases of such restraint are instances of toleration: only where the restraint is motivated by an appropriate reason is the response a distinctively tolerant one. There is some unavoidable vagueness about how restrictive 'interference' with the disapproved conduct can be while remaining consistent with toleration. At one extreme, in normal circumstances, the mere attempt to dissuade a person by reasonable argument from engaging in the disapproved conduct is entirely consistent with acting tolerantly. At the other extreme, the use of physical coercion to prevent an agent engaging in the disapproved conduct is utterly inconsistent with toleration. The key variable is the degree of coerciveness of the interference. The extent to which the imposition of costs which fall short of prohibition or prevention, such as informal social ostracism, higher taxation of disapproved conduct and other forms of disincentive, is compatible with toleration is partly a matter of circumstance and intent, and often involves judgments which allow for reasonable disagreement. In general terms, the more such disincentives incline towards coercion the less consistent they are with toleration. The paradigm of intolerance is the deliberate attempt to eliminate disapproved conduct by coercive means; in its most extreme and ruthless form, persecution. Toleration is therefore a matter of degree (see Coercion).

The moral ideal of toleration can be seen as a mean between intolerance, or the refusal to permit that which should be permitted, and indulgence or laxity, the permitting of that which should not be permitted, without lapsing into indifference, the refusal to judge that which should be judged. Much dispute about toleration has concerned its proper scope and limits. This, in turn, is usually related to differing accounts of the moral grounds or justification of toleration.

3 The justification of toleration

Many arguments for a policy of toleration with respect to particular beliefs or actions are largely prudential or pragmatic. They are couched in terms of the costs (social, economic or political) of intolerance for the intolerant themselves. Such arguments have been, and continue to be, of enormous practical importance, especially in the context of violent religious or political disputes. They are often effective where appeals to more high-minded concerns are not. Nor can such prudential considerations be separated entirely from moral arguments for toleration since they commonly invoke values such as peace, order, security and the avoidance of suffering. However, they do not involve any deeply principled defence of toleration.

The limitations of such arguments are evident in assessing utilitarian justifications of toleration. Utilitarians typically argue for toleration in terms of the maximization of happiness, welfare, preference satisfaction or whatever interpretation is given to utility. The limits of toleration should be set so as to obtain the optimum balance of benefits over harms. As with all utilitarian arguments, however, this defence of toleration is unavoidably conditional upon the truth of many controversial and disputable historically and culturally variable empirical claims. Thus utilitarianism offers a rather precarious and uncertain defence of toleration, heavily dependent upon contingent social circumstances. Moreover, in view of the difficulty of establishing the truth of many of the empirical claims, it is perhaps not surprising that while some utilitarians, such as J.S. Mill, have been uncompromising advocates of toleration, others, such as Mill's contemporary J.F. Stephen, have been considerably less enthusiastic in their support. Indeed, utilitarians are likely to have most difficulty justifying toleration precisely where it may be most needed; that is, in a society with an intensely intolerant majority (see Utilitarianism).

Another argument for toleration has derived from moral or religious scepticism (see Moral scepticism). On this view, since we can have no guarantee that we possess moral or religious truth we are not justified in imposing on others our own beliefs about these matters. Toleration, therefore, is the only proper response to our fallibility or to the absence of any discernible truth with respect to moral and religious beliefs. Undoubtedly the growth of religious scepticism was an important source of increased religious toleration but the affinity between toleration and scepticism is not as straightforward as it might appear. It has also been argued that if we can never have knowledge of the truth in moral and religious matters, or if there is no truth about such matters to be discovered, then there is nothing wrong with enforcing uniformity of belief. If allowing freedom of belief promotes disunity and creates social tensions, and suppression of beliefs involves no loss of truth, why not seek to rigorously control such diversity?

What this discussion so far suggests is that neither pragmatic nor utilitarian nor sceptical arguments can provide a very secure basis for a principle of toleration. Such a principle must be underpinned by a moral theory which provides stronger support. Much recent moral and political philosophy has been concerned to articulate a defence of toleration in terms of principles or values such as autonomy, impartiality and respect for persons. What these arguments typically seek to show is that toleration is an essential element of any society in which each individual will have the possibility of living an autonomous life; or a necessary implication of the requirement that the state should be impartial between different conceptions of the good; or integral to the idea that every person is an end in themselves and therefore deserving of respect.

All of these arguments are complex and give rise to controversy, and each has been developed in interestingly different ways. In very broad and general terms, however, they are all informed by a particular conception of the person and a view about the proper limits of coercive interference, especially by the state, in people's lives. Persons are conceived as choosers, capable of forming and pursuing their own conception of the good. Each person should be able to exercise significant control over their own life, to make and act on their own choices and decisions, without being subject to coercive interference by other people or the state. The responsibility of government is to secure the conditions under which this is possible, though it is a matter of dispute exactly what this will entail. There is, however, widespread agreement among proponents of these arguments for toleration that it is not the government's role to prohibit, or even on some views to promote, any specific conceptions of the good (see Neutrality, political §2).

In modern Western societies, disagreements about the scope and limits of toleration have centred around race, religion, gender, sexual practices and political affiliation. In particular, dispute has surrounded the permissibility of

‘hate’ speech, pornography and, in the UK at least, blasphemy. Many of these disputes have been further complicated by the development of multicultural societies and the need to arrive at mutually acceptable terms of accommodation for groups with deeply opposed conceptions of what constitutes a valuable life. What is particularly noteworthy is that attacks on toleration in these areas have frequently come not from the traditional opponents of toleration but from groups such as feminists, socialists and even some liberals. While the question of the extent to which the intolerant should themselves be tolerated has always proved difficult, many of these more recent disputes go well beyond this familiar problem, calling into question some of the most basic tenets of typical liberal accounts of toleration.

Toletus, Franciscus (1533-96)

Toletus had an independent, somewhat eclectic, but fundamentally Thomistic outlook. In philosophy his most important works were his commentaries on Aristotle in the areas of logic and natural philosophy. In these commentaries he drew upon the whole previous scholastic tradition to raise and answer questions which were debated in his time and later. In theology he commented upon the greater part of Aquinas' Summa theologiae. Here again he drew upon scholastic philosophers to raise and discuss a wide variety of metaphysical, epistemological and ethical topics. Far from being a slavish follower of Aquinas or Aristotle, he expressed his respectful disagreement with them wherever reason compelled it.

1 Life

Franciscus Toletus (Francisco de Toledo) was born at Cordoba in Spain. After receiving a master of arts at Valencia, he studied theology at Salamanca under the famous Domingo de Soto. Ordained a priest in 1556, Toletus was already teaching philosophy at Salamanca when he entered the Society of Jesus (the Jesuits) in 1558. In the following year he was sent to Rome where he taught philosophy and then theology, bringing with him the Thomistic outlook emphasized at Salamanca by Francisco de Vitoria and his disciple, Soto. Toletus went on diplomatic missions to Germany, Poland, the Low Countries and France for the Holy See, and in 1593 became the first Jesuit cardinal. He died in Rome.

2 Commentary on Aquinas

His partial commentary on the *Summa theologiae* of Thomas Aquinas (§6) was left in autograph at the time of his death and was published in four volumes only in the nineteenth century. It addresses issues about most of the first sixty-four questions of the First Part (Ia), the first eighty-eight questions of the second part of the Second Part (IIaIIae) and the ninety questions of the Third Part (IIIa) of the *Summa*. Written in a clear and lively style, it is not simply an exposition of the text of Aquinas. Toletus is interested in the whole of scholasticism, especially in Duns Scotus, Durandus of St Pourçain, William of Ockham, Cajetan, Lychetus and others in relation to Aquinas. In discussing their concerns, he goes far beyond the text of the *Summa*. For example, in a First Part (*In Summam Theologiae* q.2 a.1) discussion of self-evident propositions he explores the historical issue of the self-denying statement, 'There is no truth.' In the same part (*In Summam Theologiae* q.2 a.3), most likely reflecting Cajetan, he says that taken by itself each of Aquinas' famous five ways proves the existence of God only imperfectly, but taken together they demonstrate a collection of attributes which can belong only to God. In a Second Part (*In Summam Theologiae* q.57 a.3) discussion Toletus separated the 'law of nations' (*jus gentium*) from the natural law and thus set the stage for later Jesuits such as Suárez (§4) to do the same. Again in the Second Part, he expanded Aquinas' treatment of war in various ways. For example (*In Summam Theologiae* q.34 a.1 dub.4), he distinguished three classes of soldiers (those subject to some prince, those not subject who have accepted salaries to fight in time of war, those not subject and not salaried) and discussed their respective obligations to consider the justice of any war in which they may take part, as well as the obligations to restitution they may incur.

3 Logic

The first of Toletus' expressly philosophical works was his *Introductio in dialecticam Aristotelis (Introduction to the Dialectic of Aristotle)* which appeared at Rome in 1560. Reflecting medieval as well as Aristotelian concerns, through five books it dealt with the definition and division of dialectics; with terms (nouns and verbs) and propositions; the supposition, the ampliation, the restriction and so on, of terms; the opposition, equipollence and conversion of propositions; modal propositions and exponibles; reasoning and syllogisms (both proper and fallacious). In 1572, Toletus published at Rome a commentary together with questions on Aristotle's logic. Through seven parts, he treated questions on logic in general, on the five universals of Porphyry, as well as on the *Categories*, *Perihermeneias* and *Posterior Analytics* of Aristotle. His procedure, as he laid it out, was first to explain a question, and then to give those opinions 'which beyond the fact that they are the views of eminent men seem able to offer some reward to their hearer' ('Lectori', *Introductio in dialecticam*). Third, he showed what should be held as more certain and, finally, he refuted opposing arguments (see Logic, Renaissance).

4 Physics

In 1573, Toletus published a commentary with questions on the eight books of Aristotle's *Physics*. In this work, disagreeing with Aquinas and a majority of scholastics, he sided with Bonaventure and Henry of Ghent to deny the possibility of an eternal creation. In support of his position, he offered twelve arguments, of which the first seven he said were demonstrative and the last five less than that. His first argument which went back beyond Bonaventure, at least to al-Ghazali, was to the effect that if the world had existed from all eternity there would have been by now an infinity of human beings. But since every human being has an immortal soul, there would at the present time exist an actual infinite number of such souls. But an actual infinite number is an impossibility. His sixth argument asks, if the world had been created from all eternity, where would the sun have been created? Would it have been created in the east or in the west, in the north or in the south? It could not have been created simultaneously in all these places. Neither could it have been created in one of these places to the exclusion of the others. Otherwise, we could obviously mark a first *terminus a quo* for the motion of the sun and thus a first moment of time. Hence the world could not have been created from eternity. His ninth argument is that if the world were eternal, by now (judging from the multiplication of the human race from Adam) there would be an actually infinite number of human beings on this earth. Again, apart from the obvious fact that this is not the case, such an actual infinite number would be impossible. His tenth argument is that if the world were eternal, the hours, days, months and years before now would all be infinite. And inasmuch as one infinity cannot be greater than another, all of these would be equal. But this would amount to saying that an hour would be equal to a day, to a year, or to a century - which is patently absurd.

It is difficult to reconcile Toletus' position here with the one he took on an actual infinite number when commenting on the First Part (Ia) of the *Summa theologiae*. In his *In Summam Theologiae* (q.7 a.4), Toletus treats the matter 'theologically', siding with Avicenna (see Ibn Sina §4), al-Ghazali (§2), and also William of Ockham, Gregory of Rimini and Gabriel Biel (§4), to oppose Aquinas and say that most probably such a number can be realized. In support of this he claims that God can create more and more human beings without limit and that such an unlimited multitude can actually exist together from eternity in the divine knowledge. It is further probable, he thinks, that God, by his absolute power, could create such an unlimited number all at once. In an *ad hominem* argument aimed at Aquinas, Toletus says that anyone who accepts the possibility of an eternal world should admit the possibility of an actual infinite number of immortal human souls. At the same time, consistent with his commentary on the *Physics*, Toletus does allow some probability to the opposite view that an actual infinite number is impossible. Linked with this he says that 'because I do not understand, I prefer to grant to, rather than take away from, the divine power what is a mark of perfection and what I do not understand' (*In Summam Theologiae* q.7 a.4).

5 Other works

Two other philosophical works published by Toletus at Venice in 1575 were in the form of commentaries with questions, on Aristotle's *On the Soul* and *On Generation and Corruption*. In the former work (which was reprinted twenty-two times by 1625), he allowed (in opposition to Aquinas) a direct intellectual cognition of a singular material thing. And although he thinks it 'more probable' that an agent intellect is necessary, he regards it as 'probable' that there is no agent intellect or that such an intellect differs only aspectually (*ratione*) from the possible intellect. Affirming the immortality of the soul, he held it as probable (again in opposition to Aquinas) that although a phantasm was necessary for the inception of intellectual knowledge, once such knowledge was acquired the intellect could dispense with phantasms, and thus could function after death in separation from the body. He also maintained that the intelligible species is not an efficient cause of cognition, but is at best only a condition required for the causality of the possible intellect. Again, apparently reflecting Duns Scotus, Toletus sharply distinguished the apprehension of a propositional synthesis from the judgment which either assents to or dissents from it. This last was to be a much debated item in seventeenth-century scholasticism.

Tolstoi, Count Lev Nikolaevich (1828-1910)

Tolstoi expressed philosophical ideas in his novels Voina i mir (War and Peace) (1865-9) and Anna Karenina (1875-7), which are often regarded as the summit of realism, as well as in shorter fictional works, such as Smert' Ivana Il'icha (The Death of Ivan Il'ich) (1886), often praised as the finest novella in European literature. In addition, he wrote numerous essays and tracts on religious, moral, social, educational and aesthetic topics, most notably 'Chto takoe iskusstvo?' ('What Is Art?') *(1898), Tsarstvo Bozhie vnutri vas (The Kingdom of God Is Within You) (1893) and his autobiographical meditation 'Ispoved'' (A Confession) (1884).*

Tolstoi apparently used his essays, letters and diaries to explore ideas by stating them in their most extreme form, while his fiction developed them with much greater subtlety. Critics have discerned a sharp break in his work: an earlier period, in which he produced the two great novels, is dominated by deep scepticism; and a later period following the existential trauma and subsequent conversion experience described in 'Ispoved''. Tolstoi stressed the radical contingency of events, valued practical over theoretical reasoning, and satirized any and all overarching systems. After 1880, he assumed the role of a prophet, claiming to have found the true meaning of Christianity. He 'edited' the Gospels by keeping only those passages containing the essence of Christ's teaching and dismissed the rest as so many layers of falsification imposed by ecclesiastics. Tolstoi preached pacifism, anarchism, vegetarianism, passive resistance to evil (a doctrine that influenced Gandhi), a radical asceticism that would have banned sex even within marriage, and a theory of art that rejected most classic authors, including the plays of Shakespeare and Tolstoi's own earlier novels.

1 Life

Born into a prominent aristocratic family, Tolstoi studied oriental languages and law at Kazan University, where he failed to earn a degree. He then tried to reform his estate according to philosophical principles, a topic which recurs in *Anna Karenina*, whose hero, Konstantin Levin, meditates on why such efforts almost invariably fail. A compulsive diarist, the young Tolstoi repeatedly formulated complex rules for behaviour, which he never followed, then devised rules for insuring obedience to the earlier rules, and at last reflected on the inadequacy of all rules or systems for an understanding of human behaviour, another key theme of his fiction. Enlisting in the army during the Crimean War, he wrote military stories (the Sevastopol sketches, 1855-6) concentrating on the difference between standard narratives, whether official, literary or historical, and the realities of combat. He later recalled that immediately after a battle, soldiers would narrate their experiences in a confused way and describe events as rife with contingency; but a month later, after official accounts had described a smooth series of military engagements in conventional language, the same soldiers would 'remember' events according to the received narratives. Such experiences led Tolstoi to a deep suspicion of narrative neatness, which rules out the contingency actually governing events, a theme central to *War and Peace*.

After the Crimean War, Tolstoi was hailed as a major writer but, always suspicious of the intelligentsia he deemed self-congratulatory, he joined no intellectual camp. In 1862 he married Sofia Andreevna Bers, and devoted the ensuing years to his marriage (he eventually had thirteen children) and the writing of *War and Peace*. In the 1870s he wrote *Anna Karenina* and then experienced the most significant of his many psychological crises, leading to the adoption of his own reformulated Christianity. His new ideas led to estrangement from his wife, and their marriage from this point on deteriorated and became complicated; it has been the subject of numerous, vaguely voyeuristic biographical treatments.

In addition to theological tracts and many essays, Tolstoi wrote endless diaries, which were evidently designed to be published and so resemble stage whispers. Regarded around the world as a sage, he corresponded with countless writers and thinkers, and his estate, Iasnaia Poliana, became a place of pilgrimage. His best fiction of the period deals with sexuality (in *Kreitserova sonata (The Kreutzer Sonata)* (1891)), death (*The Death of Ivan Il'ich*), and the complex psychology of sainthood (*Father Sergei* (1898)), but he also wrote one long novel, *Voskresenie (Resurrection)* (1899), usually regarded as a heavy-handed, didactic failure. Always perplexed by the contradiction between his wealthy life and the simple existence he preached, he fled Iasnaia Poliana and soon died in the course of his pilgrimage.

2 *War and Peace*

In his most lasting work, Tolstoi was deeply impressed by all those aspects of life that elude systematization or theoretical knowledge. He loved to formulate negative laws, dicta about what cannot be known or found in an unmixed state. ’Pure and absolute sorrow is as impossible as pure and absolute joy’, he writes in *War and Peace*, a sentence that reflects in its very style Tolstoian habits of thought.

In Tolstoi’s view, it is not primarily grand incidents, broad laws or dramatic decisions that shape individual or historical life, but the sum total of ordinary events. Life is made by ‘tiny, tiny alterations’ of action and consciousness, changes so small that they usually pass unnoticed, even though they are right before our eyes. What really counts is hidden in plain view, a sentiment that seems to have influenced Wittgenstein, who was an admirer of Tolstoi. At each small moment of existence, contingency reigns, not in the sense that anything can happen, but in the sense that more than one thing can happen. Time branches not only at critical moments, but always, and so our smallest decisions have moral value. Apparently inconsequential events may turn out to have great impact over time. Our decisions at critical moments are shaped by the climate of our minds, which in turn depends on the sum total of our smallest thoughts at odd moments.

No algorithm can reduce these small events to laws. With withering irony, Tolstoi, who was superb at logical analysis, detects the fallacies in attempts to construct systems that aspire to eliminate contingency. Theoreticians often assume that behind the apparent chaos of the social world reigns a hidden order, which may be expressed in a few simple laws; but Tolstoi insists that all such reasoning manages to rule out inconvenient facts and at crucial moments presumes what it hopes to prove. One example he cites for this is the Hegelian assumption that certain events not fitting a central story are ‘nonhistorical’. In *War and Peace*, he refers to reasoning by ‘stencil work’. Tolstoi suggests that the opposite assumption is closer to lived experience: the social world is fundamentally messy and order is always the result of work. It is regularity, not contingency, that requires an explanation.

In *War and Peace*, Tolstoi develops these insights in the philosophical reflections of his characters, in the events of their lives and in embedded essays, expressed not through a narrator but directly through the voice of the author. In this work, battle becomes a metaphor for history, and the radical uncertainty of combat, which only fools think can be reduced to a science of warfare, suggests the radical unpredictability of history. Tolstoi utterly rejects the possibility of laws of history and in several writings expressed particular animus to the idea of an underlying law of progress. One of the novel’s heroes, Prince Andrei, begins the novel believing in heroism, which he conceives as the ability to grasp the laws of battle and to act decisively upon them in dangerous moments. He eventually learns that battles cannot be shaped by strategy but are decided instead by ‘a hundred million diverse chances, which will be decided on the instant by whether we run or they run, whether this man or that man is killed’ - decided, that is, by events that are in principle unpredictable and chancy. The emphasis on what happens ‘on the instant’ reflects Tolstoi’s belief in the crucial importance of presentness and on the futility of assuming that only timeless principles represent the highest form of thinking. Tolstoi believed deeply in what Aristotle called *phronesis*, or practical reasoning (see Aristotle §23).

‘What science can there be’, Prince Andrei asks, ‘in a matter in which, as in every practical matter, nothing can be determined and everything depends on innumerable conditions, the significance of which becomes manifest at a particular moment, and no one can tell when that moment will come?’ Thus, the most effective soldier in the novel, Nikolai Rostov, cares nothing for theories but has developed the practical ability to grasp the shifting situations of each moment and, on the basis of unformalizable experience, to take advantage of unique and short-lived opportunities. The best generals in the novel, such as the Russian commander Kutuzov, know that they can be effective not by planning battles but by inspiring soldiers with the confidence to act intelligently. Kutuzov, in fact, falls asleep during councils of war because effective action depends on alertness. He explains that the best preparation for a battle, or any especially unpredictable and rapidly changing situation, is ‘a good night’s sleep’.

For a variety of reasons, historical narratives smooth out the contingencies of battles and of history. They therefore misrepresent the course of events, and, when taken as empirical knowledge on which to base future actions, lead to ill-conceived plans and to overconfidence in planning itself. In large part, the regularity of historical narratives reflects the essentially aesthetic need for a good story. Genres of historical writing differ, but each reflects a particular kind of plotting, all of which understate the radical uncertainty of the world precisely by telling a neat story. Plot contains implicit philosophy, and Tolstoi relentlessly teases out the hidden and fallacious assumptions behind various narrative forms. For reasons of mental economy, memory also works by filtering out the

contingent. Indeed, the fallacies of memory and narrative are present in initial acts of perception. In his novels, Tolstoi demonstrates these truths with portraits of events, their perception, their later appearance in memory and their encapsulation in the narratives characters and real historians construct.

In a series of draft introductions to *War and Peace*, Tolstoi evokes the image of a man viewing a distant hill on which only trees are visible. The man may conclude that the region in question contains nothing but trees. This conclusion would be a trick of perception, because smaller objects are simply not visible at a distance. In the same way, historians focus on unusual and big events because they are the most likely to be recorded. Part of the strategy of *War and Peace* is to contrast the picture of historians with a recreation of what events must have been like. We also commit this fallacy of perception in our individual lives, because memory does not preserve, or we cannot easily recall, small events that do not fit a pattern or story, but which may have been most effective and may even have constituted the essential quality of our lives. *War and Peace* is largely about the need to reverse some mental habits.

3 *Anna Karenina*

In both *War and Peace* and *Anna Karenina*, Tolstoi develops a theory of psychology. Perhaps indebted to Locke through the medium of Laurence Sterne's novel *Tristram Shandy*, Tolstoi conceives the mind as an agglomeration of mental habits, each the result of small actions taken many times. These habits do not cohere into a whole; wholeness, like moral integrity, is a project we undertake but never complete. At any given moment, the mind has many thoughts and sensations, too many for effective action if we did not have the capacity to focus our attention on one or a few of them. Numerous tiny alterations are taking place on the periphery of consciousness, much as small events are always taking place in history, and these have their effect. But we rarely notice them, precisely because by definition one cannot focus one's attention on what escapes one's attention. One can only glimpse them at moments when attention shifts, and Tolstoi illustrates this process in detail.

Tolstoi is also famous for exploring in meticulous detail the relation of the body to the mind. At the periphery of attention characters are dimly aware of bodily sensations but are usually unaware of how they affect the direction of their thoughts. Or a character may be smiling out of habit or because of a thought experienced some time earlier, with the smile simply forgotten on his face. Anyone trying to guess his current thoughts by that smile would be mistaken because the mind is never whole and because at any given moment is temporally layered. We are all palimpsests.

In both *War and Peace* and *Anna Karenina*, Tolstoi develops an approach to ethics that might be called casuistical in the root sense of the word. Theoretical reasoning, proceeding from general principles to the particular situation, tends to oversimplify events. We do better by educating an ethical sensibility through sensitive attention to particular cases as they arise throughout life and then, at each moment, trusting a well-developed ethical sensibility (see Moral particularism).

Anna Karenina applies these general ideas to social life and to the problem of reform. As *War and Peace* rejects the romanticized idea of great heroes directing history, *Anna Karenina* may be viewed as a polemic against the assumption that romantic love (the sort to be found in *Romeo and Juliet* and in countless works of popular culture) is the only kind. The tragedy of Anna derives from her acceptance of this myth. The wiser characters, such as Kitty, understand that love may also be prosaic and that a successful marriage must be based precisely on prosaic love, which cultivates not grand gestures but small acts of intimacy that do not make a compelling story. The novel's famous first sentence - 'All happy families resemble each other; each unhappy family is unhappy in its own way' - suggests that unhappy families each have a unique story, whereas happy family lives are composed of prosaic incidents that do not make a compelling story. Plot is an index of error and of a life lived badly.

The novel's hero, Levin, hopes to reform Russian agriculture by introducing Western machinery and applying the conclusions of social science. He discovers that successful reform never proceeds down from universal principles forced on a reluctant population, but by reasoning up from local conditions, which are always particular, and adopting measures that improve upon what already exists. We sense here Tolstoi's deep conservatism and scepticism about the abstract theorizing of intellectuals.

4 Aesthetics and late writings

For Tolstoi before his conversion, realistic novels were the supreme art form because they provide, more than any other literary or non-literary writing, a rich sense of the particularities of ordinary existence. Nevertheless, novels also mislead because they, like other forms of narrative art, offer too neat a picture. Precisely because the author knows the story in advance and plans everything to fit, novels misrepresent our temporal experience by letting a pattern of the whole dictate what happens and by ruling out contingency. Tolstoi experimented with various ways of avoiding this error, and so wrote *War and Peace* (and to a great extent *Anna Karenina*) without an advance plan, letting each serialized part develop potentials in earlier parts but with no overall end in view. In fact, *War and Peace* never really ends, it just breaks off.

In *Anna Karenina*, Tolstoi developed a general theory of art on which he expanded in *What Is Art?* and other writings. The novel's true artist, Mikhailov, paints not by applying techniques or by adhering to the tenets of any school, but by learning to see and record the particularities of experience. He is always observing small events of life and remembering them. Because everyone's experience is unique, he can be certain that his painting will convey an aspect of experience no one else has conveyed.

In *What Is Art?*, Tolstoi first offers a showcase demolition of all the received schools of aesthetics and then presents his own view. Like Mikhailov, the true artist conveys an experience so sensitively that he manages to 'infect' his audience with the feelings he himself had. But many so-called artists work quite differently, by applying a set of abstract techniques copied from other artists. Though gaudily 'interesting', their work is not true but 'counterfeit' art because it results from no particular and unique experience. True art may be divided into good and bad on moral grounds. A bad but true artist successfully infects his readers with pernicious moral feelings (see Art and morality §3). Tolstoi rejects most of the canon of Western art as either immoral (Maupassant) or counterfeit (Wagner) or both (Shakespeare). His favourite example of good, true art was the story of Joseph in the Bible.

By goodness Tolstoi came to mean the tenets of Tolstoian Christianity. He rejected all miracles, all sacraments and the divinity of Christ. Relying on the Sermon on the Mount (Matthew: 6-7), he took Christ's most important commandment to be 'non-resistance to evil', from which he derived a rejection of any institution based on force and so arrived at anarchism. He interpreted social and cultural institutions as so many curtains for concealing from ourselves our mortality (the theme of *The Death of Ivan Il'ich*) and for creating intermediaries between the practitioners of violence and ourselves, who benefit from it. He went so far as to argue that crime would cease if prisons and police were abolished. In these writings, Tolstoi seems far from the radical sceptic of his earlier years - and from occasional works of his old age, such as his novella *Father Sergei*, which reflects with evident self-irony on the distortions induced by aspirations to sainthood. Admirers of Tolstoi's thought are divided between those who think of him as the prophet of non-resistance and those who prefer his sense of the futility of all-embracing systems.

Tominaga Nakamoto (1715-46)

Tominaga Nakamoto was a leading representative of what some scholars have called the eighteenth-century 'enlightenment' movement in Tokugawa thought. Nakamoto's philological critiques of the historical development of Buddhist, Confucian and Shintōdoctrines are noteworthy for their modern, empiricist tendencies. His advocacy of makoto no michi, *or 'the True Way', a quotidian ethics advocating practical morality, gained no real following during Nakamoto's brief life.*

Nakamoto was the third son of Tominaga Hōshun, an Ōsaka *shōyu* (soya sauce) merchant who cofounded the Kaitokudōacademy. The neo-Confucian scholar Miyake Sekian (1665-1730), directed Nakamoto's education at the Kaitokudō. However, early on Nakamoto studied *kogaku*, or 'Ancient Learning', the philologically-oriented Confucianism of Itō Jinsai, OgyūSorai and Itō Tōgai. Those *kogaku* scholars had criticized neo-Confucians for misconstruing the original Confucian teachings. The latter, they generally agreed, conveyed a sagely wisdom worthy of faithful obedience.

Nakamoto surpassed contemporary *kogaku* schools by claiming that there was nothing sacrosanct about ancient Confucianism: it was one of several schools which appeared during an age of profuse philosophical activity in ancient China. After expounding this view in his *Setsuhei (Philosophical Obscurantism)*, Nakamoto was expelled from the Kaitokudō. The *Setsuhei* is no longer extant, suggesting that contemporaries saw it as a pariah work. Its ideas were recalled, however, in Nakamoto's *Okina no fumi (An Old Man's Notes)*.

In his *Shutsujō gogo (Buddha's Post-Enlightenment Teachings)*, Nakamoto similarly criticized the history of Buddhism, claiming that Mahāyāna teachings were later accretions, not legitimate accounts of the historical Buddha's sermons as Mahāyāna Buddhists claimed them to be. *Shutsujō gogo* explained the cardinal principle of Nakamoto's critical philology, *kajō*, or 'transformative accretion'. It asserted that throughout the Buddhist tradition new ideas had been attributed (*ka*) to the Buddha, effectively and illegitimately transforming (*jō*) his message time and again (see Buddhist philosophy, Japanese).

Nakamoto cautioned that language must be understood relative to three factors: the person using it, the historical period in which it is used, and the context of its use (see Language, philosophy of). Nakamoto also distinguished five contexts of meaning: (1) later explication, (2) the original teaching, (3) implicit significance, (4) heated debate and (5) rebuttal. Through hermeneutics based on these contexts, one could come to understand the history of philosophical thought.

In his last work, *Okina no fumi*, Nakamoto criticized Shintō, arguing that it had been invented by medieval Japanese to compete with Confucianism and Buddhism (see Shintō). Nakamoto faulted Shintō for its excessive secrecy, which contradicted his notion of *makoto no michi* (the True Way). While allowing that elements of Confucianism, Buddhism and Shintō were intrinsic to *makoto no michi*, Nakamoto suggested, contrary to his principle of *kajō*, that his 'True Way' was not just a later accretion.

Nakamoto's writings never circulated widely. Prior to the efforts of Professor Naitō Konan at Kyoto University in the 1920s, *Okina no fumi* was an obscure work even among specialists in Tokugawa thought. Nakamoto's *Shutsujō gogo* did, however, influence *kokugaku* (National Learning) scholars such as Motoori Norinaga and Hirata Atsutane in their rejection of Buddhism.

Tonghak

Tonghak is an indigenous religion in Korea. Founded by Ch'oe Cheu (1824-64), it presently flourishes under the new name of Ch'ôndogyo. An eclectic religion, Tonghak borrowed from Confucianism, Buddhism, Daoism, Christianity, shamanism and other folk beliefs. Its central tenet is founded on the concept of In nae ch'ôn *(Man is God). God is not a supernatural God who exists outside or beyond man, but is an immanent God who is present within every man.*

Disturbed by the unsettling political, social and economic conditions, and frustrated by his own unhappy family circumstances, the founder of Tonghak, Ch'oe Cheu (also known by his honorific name Suun), embarked on a long and tortuous search by means of meditation and study for a new way for the salvation of his fellow men. Suddenly, on the fifth day of the fourth month of 1860, he fell shivering into a trance, during which he heard a voice from Heaven. For a year thereafter, he experienced similar encounters from time to time. In 1861 he started to proselytize, based on the revelations he received. He named his teaching Tonghak (Eastern Learning) as a counter to Catholicism (known then as Sôhak, or Western Learning), which had made significant inroads in Korea. In 1864, he was executed by the provincial government on the charge of spreading false teaching to confuse the people.

The basic doctrine as taught by Ch'oe Cheu is embodied in the *Tonggyông taejôn (Bible of the Tonghak Doctrine)* and *Yongdam yusa (Hymns from the Dragon Pool)*, and was further clarified and refined by the leaders who succeeded him. From the moment of conception, according to Ch'oe Cheu, man is endowed with the mind of God and God is present within every man ever after. (In referring to God, Ch'oe Cheu used both the Sino-Korean word *Ch'ônju (Lord of Heaven)* and the native Korean word *Hanulim* (God) interchangeably.) Thus, God said: 'My mind is your mind (*Osim chûk yôsim*).' Accordingly, Tonghak emphasizes the oneness of God and man, in which man is a manifestation of God. Though God is omniscient and omnipotent, he can realize his will only through men. Hence there is room for evolution in this world (see God, concepts of).

Man must work, according to Ch'oe Cheu, to 'serve God (*si ch'ônju*)' by maintaining the upright mind and proper deportment (*susim chônggi*) in addition to the 'humanity, righteousness, propriety and wisdom that the former sage taught'. The essence of the Tonghak teaching, he said, lies in the three words: sincerity (*sông*), reverence (*kyông*) and faith (*sin*) (see Xin). But whereas in Confucianism, only the educated are capable of becoming 'superior men', in Tonghak all men without regard to their educational or social background can attain that status (see Confucian philosophy, Chinese).

Concomitant with the idea that Man is God is the concept emphasized by Ch'oe Sihyông (1829-98), the second leader of Tonghak, who maintained that because man is God, 'every man should be treated as a God (*sain yôch'ôn*)'. There can be no social distinction based on birth, education or any other factor. Ch'oe Sihyông said: 'Because man is God, all men are equal and there can be no discrimination. Any artificial distinction of men between high and low violates God's will.' Another concept that underlies Tonghak is the idea that 'all men evolve toward oneness' (*tonggwi ilch'e*). When people realize the truth that man and God are one, all will turn to this truth and evolve towards becoming one with God. The Tonghak teaching also contains a nationalistic element, in so far as Ch'oe Cheu called for 'protecting the nation and securing peace for the people' (*poguk anmin*) against the potential threat from Japan and the Western nations.

In addition to such theological and scholarly principles, Tonghak appealed to the uneducated masses by promising salvation via mystical experience (see Mysticism, nature of). It promised that those who practised the true faith would have their diseases cured, and that the ritual incantations of certain sacred formulas and the possession of a prescribed talisman would give them supernatural power to ward off evil and sickness. It also assured faithful followers freedom from worldly oppression and suffering. The Tonghak founder then urged his followers to work for 'the salvation of all people' (*Kwangje ch'angsaeng*).

Attracted by its humanitarian and egalitarian teaching, many people at the grassroots level accepted Tonghak, especially peasants. In spite of harassment and persecution by the government, its strength grew rapidly and it became a powerful social and political force in Korea. In 1894, Tonghak followers played a central role in leading

the great insurrection known as the Tonghak rebellion that almost brought down the Chosôn dynasty and touched off the first Sino-Japanese war. In 1905, under the leadership of Son Pyônghûi, Tonghak was reorganized, adopting the new name Ch'ôndogyo (Religion of the Heavenly Way). Throughout the Japanese colonial period, Ch'ôndogyo remained strongly nationalistic, playing a leading role in the March First movement in 1919. In addition to being a religious organization, Ch'ôndogyo has played an active role in promoting Korea's national, social and cultural causes. Today it has about 600,000 followers.

Totalitarianism

A term adopted in the 1920s by the Italian philosopher Giovanni Gentile to describe the ideal fascist state, 'totalitarianism' quickly acquired negative connotations as it was applied to the regimes of Hitler in Germany and Stalin in the USSR. Within political science it has generally been used to refer to a distinctively modern form of dictatorship based not only on terror but also on mass support mobilized behind an ideology prescribing radical social change. Controversially, the specific content of the ideology is considered less significant than the regime's determination to form the minds of the population through control of all communications.

Totalitarianism has attracted the attention of philosophers as well as political scientists because a number of classic philosophical systems have been suspected of harbouring totalitarian aspirations, and also because the model of total power exercised through discourse has been used by critical theorists to mount an attack on modernity in general.

1 The fascist doctrine of totalitarianism

The concept of totalitarianism began its career in Italy in the 1920s as an ideal formulated for Mussolini's Fascist regime by Giovanni Gentile (§3) (see Fascism). Gentile, whose idealist philosophy was deeply indebted to Hegel, argued that the state is an all-embracing ethical reality, that state and individual are inseparable and that only in and through the state can individuals realize their true freedom. Fascism, to Gentile, was essentially a spirit that ought to manifest itself in every aspect of life. In 'The Doctrine of Fascism', published under Mussolini's name in 1932, he declared: 'For the Fascist all is in the state and nothing human or spiritual exists, or much less has value, outside the state. In this sense, Fascism is totalitarian' (Gregor 1969: 223). For a while the connotations of the term were favourable, sufficiently so for it to be used approvingly by the Marxist thinker Antonio Gramsci to describe the Communist Party. However, it took on different senses upon being borrowed to describe the more formidable dictatorships of Hitler and Stalin, and was developed into an ideal-type within political science.

2 Ideological domination

According to the classic theories put forward after the Second World War by Hannah Arendt in *The Origins of Totalitarianism* (1951) and by Friedrich and Brzezinski in *Totalitarian Dictatorship and Autocracy* (1967), 'totalitarianism' means a distinctively modern type of dictatorship of which Nazism and Stalinism are the most prominent examples. Power within such a state rests not only upon the control exercised by a single party over all aspects of social organization, nor even merely upon the terror wielded by the secret police. An essential aspect of totalitarian rule is ideological domination, guided by an official ideology aimed at radical transformation. Whether this ideology appears to be right-wing or left-wing is beside the point. Differences of content between the racist ideology of Nazism and Stalin's Marxism-Leninism seemed to the theorists of totalitarianism to be less significant than the structural similarities between two regimes that attempted to mould the thoughts of their subjects into conformity with official ideology. Criticism of the concept of totalitarianism has focused particularly upon this central claim that regimes whose ideologies appear to be diametrically opposite are in fact essentially similar.

Friedrich and Brzezinski regard all ideological one-party regimes as totalitarian, whereas Arendt's use of the concept is more complex and is restricted to a few particularly extreme cases. For Arendt, the most characteristic totalitarian institution is the concentration camp, which exemplifies the pursuit of total power by dehumanizing its victims to the point where the human attributes of plurality and spontaneity have been destroyed. Totalitarian ideology is the intellectual expression of this, since it allows no room for individual thought. The key feature of these regimes for Arendt was not simply the adoption of an ideological principle (such as the claim that class struggle or race war is the key to history), but rather the relentless working out of that principle to its logical conclusion in the extermination of whole peoples or classes deemed to be 'objective enemies'. At the heart of totalitarianism, according to Arendt, was the blind pursuit of logical reasoning unrestrained by common sense. In her view, atomized individuals in modern mass societies are particularly vulnerable to the appeal of this kind of ideological reasoning.

3 Philosophy as a source of totalitarianism

If there is an affinity between totalitarianism and logic, if totalitarian regimes are distinctively ideological

dictatorships, and if the concept itself began life as a philosophical ideal, does philosophy itself (or at any rate certain philosophers) bear some responsibility for the horrors of the twentieth century? This claim was advanced most notoriously by Karl Popper (§4), who argued in *The Open Society and Its Enemies* (1945) that Plato in the ancient world and Hegel and Marx more recently had harboured the seeds of totalitarianism, opposing the ‘open society’ in which critical thinking, freedom and progress can flourish. Popper concentrated his attack particularly on ‘historicism’, or the claim that there are laws of history which can be discovered, enabling one to predict the future (see Historicism §2).

As the most notable philosopher of history, Hegel (§8) has been especially liable to be accused of being a progenitor of totalitarianism, particularly since his influence can be clearly traced both in Marxism-Leninism and in Gentile’s fascism (although not in Nazism). Students of Hegel maintain that this imputation is unjust, and even that Hegel should be seen as a liberal. It should be noted, however, that Gentile was also a liberal who considered that since true freedom is to be found through the ethical state, fascism was the consummation of liberalism. Isaiah Berlin’s attack in ‘Two Concepts of Liberty’ (1969) on ‘positive’ concepts of freedom was largely directed at the use made by fascists and Marxists of Hegelian ideas (see Berlin, I.).

The notion of any *direct* connection between totalitarian atrocities and philosophic indiscretions was dismissed by Hannah Arendt, who argued that the advent of totalitarianism owed more to practices developed by imperialist regimes than to abstract theories. Nevertheless she maintained that philosophers from Plato to Marx and Heidegger (a prominent supporter of Nazism) had facilitated totalitarianism because they had failed to appreciate human plurality. She suggested that this failure to notice the political implications of plural actions and multiple points of view might be an occupational hazard of philosophic solitude.

Another political thinker prompted by bitter experience to criticize intellectual hubris was Albert Camus, who argued in *The Rebel* (1951) that totalitarianism was the ultimate consequence of humanism gone sour, of a metaphysical rebellion that had culminated in the attempt to deify man.

4 Totalitarianism and the critique of modernity

Although the notion of totalitarianism has been applied primarily by theorists living in comparatively ‘open’ societies to regimes that have been manifestly terroristic, this model of domination in and through ideas and discourse has also been turned into a stick with which to beat liberal societies themselves. In *One-Dimensional Man* (1964), Herbert Marcuse argued that the apparent freedom of individuals in modern capitalist societies was illusory, because the desires and choices of consumers were moulded by cultural forces that served the purposes of the system of production while failing to satisfy the real needs of the population. ‘Under the rule of a repressive whole, liberty can be made into a powerful instrument of domination’ (Marcuse 1964: 21). From this point of view, the fact that people in the USA could be controlled without the use of terror made the USA even more effectively totalitarian than more overtly repressive regimes, and made liberation less likely.

Marcuse’s Frankfurt School colleagues Max Horkheimer and Theodor Adorno had already discovered totalitarianism deeply embedded in modern civilization. In *Dialectic of Enlightenment* (1973), they claimed that the project of liberating mankind by developing instrumental reason, science and technology had given rise first to the domination of nature and then (by a dialectical process) to the enslavement of mankind. On this deeply pessimistic view, totalitarianism is the direct outcome of enlightenment (see Critical theory §5). A generation later Michel Foucault, focusing on the development during the Age of Reason of prisons and other disciplinary institutions, also discovered totalitarianism at the heart of liberal modernity, and set out to unmask the power inherent in the production of truth and the discipline exercised through scientific disciplines (Foucault 1977). As in the cases of Horkheimer and Adorno and of Marcuse, power is diffused throughout Foucault’s ‘disciplinary society’ rather than being concentrated in the hands of the dictator. Even in Arendt’s version, however, the apparently all-powerful dictators have made themselves slaves of suprahuman forces. Common to many theories of totalitarianism is a sense that the imprisoning structures and destructive processes have been created by human beings but have escaped from human control. This nightmare forms a sharp contrast to the original philosophical vision of a totally intelligible and totally harmonious society.

Tradition and traditionalism

Tradition is that body of practice and belief which is socially transmitted from the past. It is regarded as having authority in the present simply because it comes from the past, and encapsulates the wisdom and experience of the past. For some, the very idea of tradition is anathema. It is characteristic of modernity to reject the authority of the past in favour of the present deployment of reason, unencumbered by tradition or prejudice. While prior to the seventeenth century tradition was largely unquestioned as a source of insight, and in need of no defence, since the Enlightenment the notion of tradition has been defended by traditionalists such as Burke and, more recently, Hayek. Upon inspection, however, traditionalism, if not indefensibly irrational, turns out to be a demonstration of the overlooked rationality contained within traditions. Traditions often turn out upon inspection to be not so much irrational as subtle and flexible deployments of reason in particular spheres.

1 Antitraditionalism

According to Karl Popper, a prevalent modern attitude to the past holds that 'I am not interested in tradition. I want to judge everything on its own merits… quite independently of any tradition… with my own brain, and not with the brains of other people who lived long ago' ([1949] 1963: 120-1).

Have there ever been people who thought in this way? In *The Frogs* Aristophanes depicts Euripides as wanting to teach his audiences to use their own brains, unfettered by meaningless traditions, and uncowed by authoritarian windbags who simply spout outdated myths. But we should remember that Aristophanes was hostile to Euripides. Furthermore, Euripides' plays certainly exploit old myths, and not always with new intentions.

In the eighteenth century, Diderot insisted that a true philosopher would 'trample underfoot prejudice, tradition, venerability' and admit nothing 'save on the testimony of his own reason and experience', possibly oblivious of the fact that that doctrine itself had by 1750 become well embedded in the philosophical tradition to which he belonged (Wilson 1972: 237). Critics of the French Revolution, such as Burke and de Maistre certainly saw the revolutionaries as attempting to break with tradition, but again, in view of their constant invocations of ancient Roman and republican virtue, it is doubtful that the revolutionaries conceived themselves as operating independently of any tradition. In the twentieth century, Keynes, along with many others, saw traditional morality as a crippling burden. Every decade or so artistic avant-gardists have called for the need to create anew, 'burning one's path behind one' (as the Russian constructivist Malevich put it). In retrospect, of course, the reality is that antitraditionalism is always selectively antitraditional, and that, as Popper says, whether we like it or not, we always stand on the shoulders of at least some of our predecessors.

2 Burkean traditionalism

Nevertheless since the end of the eighteenth century, in face of explicit verbal attacks on traditions, attacks on respect for tradition and successful assaults on parts of actual traditions, a line of thinking has developed which defends the virtues of tradition against its critics. In this explicit defence we encounter what might be called traditionalism, an attitude of mind intended to curb the pretensions of present reason to criticize traditional beliefs, institutions and practices.

One of the first and certainly one of the most famous expositions of traditionalism is that of Burke.

> We are afraid to put men to live and trade each on his own private stock of reason; because we suggest that this stock in each man is small, and that the individuals would do better to avail themselves of the general bank and capital of nations and of ages.
>
> ([1790] 1967: 84)

Burke argues that old prejudices should be cherished both because they are prejudices, and because they are old. Prejudices are easily applied in emergencies, and they can also become habitual, rendering, as he says, a man's virtue his habit. He also argues that if they are examined sympathetically, they will generally be found to contain 'latent wisdom', encapsulating the wisdom of the ages and of much experience, which would be likely to elude us if we relied solely on our present stock of reason (see Burke, E.).

In Burke's approach to tradition there is not a little hint of Adam Smith's invisible hand, transposed to the moral and political sphere; that is, reason as well as economic equilibrium can emerge through the actions and decision of individuals who have no conception of the greater order to which they contribute (see Smith, A.). By a process resembling natural selection, fruitful lines of behaviour will be rewarded and reinforced and eventually embedded in society as a whole, although the individuals concerned may be quite unaware of this aspect of their decisions, and be taking them for reasons quite other than the evolutionary advantage they bring to the society to which they belong.

3 Hayek's evolutionary account of tradition

In the twentieth century the conception of a tradition in terms of spontaneously developing orders has been associated particularly with the work of Hayek (§3). Hayek points out that societies with successful economies have reproduced and spread themselves more than those with unsuccessful economies. Along with economic success the rules of behaviour which underlie or accompany success have also been reproduced. In particular, in Hayek's view, the institutions of the family and private property have not just been an irrelevant accompaniment to economic success; they have been central to the market order. But in market societies, these institutions have usually been promulgated and defended for religious reasons, and as the societies have prospered, so has their religion. Conversely, societies with belief systems prejudicial to the market order have tended to die out, their belief systems dying with them (see Hayek 188).

While Hayek's conception of tradition might help throw light on unsuspected links between a society's historical success and apparently unrelated aspects of its beliefs and practices, it is less clear how far what he says can amount to a defence of the traditional as such. He and Burke can certainly be read as counselling us against premature attempts to overthrow traditions, warning us to examine the unsuspected consequences of so doing in greater depth than would a Diderot or a Keynes. It is also true that any explicit judgment we make will always be made against a background of unspoken and largely traditionally based agreement, again to a greater extent than many rationalists might suspect. But, at the end of the day, when confronted by any explicit controversy, we still must make a decision, and the mere fact that something has always been done is a less than compelling reason for continuing to do it. For example, we need to know whether its always having been done has had good or bad consequences. The simple fact that a particular religion's morality is conducive to the market order is not, in itself, a reason for a sceptic to accept that religion, even if they were concerned to promote or promulgate the market. The sceptic would have to accept or reject the religion in the light of its credibility, and not in the light of its supposed contribution to social wellbeing. A sceptic may even lament their inability to go along with a traditional belief or practice precisely because they are aware of its incidental benefits.

Hayek is particularly critical of modern thinkers who find market arrangements unjust, and who believe that they can improve on them by use of their own reason. He argues that experience of the comparative success of planned and unplanned economies shows that tradition is in some respects superior to conscious human reason. In reality, it demonstrates no such thing. What experience shows is that adherence to some traditions is sometimes better than attempting to improve or replace them. And if, following Hayek, we decide to defend and develop the traditions central to the market order, this will not be because of our love of tradition as such, but because we have reasoned that experience has shown one particular tradition has superiority over others. The fact that tradition suggests limits to the scope of rational planning and advances strategies for encouraging unplanned economic activity does not mean that a decision in its favour is either irrational or purely tradition-based. So while a prejudice in favour of tradition need not be irrational, particularly if associated with a Burkean attempt to reveal its latent wisdom, this hardly amounts to a full-blooded commitment to tradition as such. Traditionalism, then, is itself either irrational, or a rather sophisticated form of rationalism, a prejudice in favour of tradition, but for good reason in so far as the traditions in question can be shown to be reasonable.

4 The flexibility of traditions

Flexibility as a characteristic of traditions would not necessarily prove unacceptable to traditionalists, who usually emphasize such a flexible nature, the way in which traditions respond to circumstances of various sorts. One of the circumstances to which traditions respond is the reasoning and discussion their adherents engage in for both internal and external reasons. There can be no denying that a long-lasting tradition of belief, such as Roman Catholicism, has undergone many developments and changes of emphasis over the centuries, so much so that one

might be tempted to wonder just how much there is in common between a twentieth-century bishop and one of the Apostles. It was this question among others which Cardinal Newman addressed in his 1845 *Essay on the Development of Christian Doctrine* (see Newman, J.H.). Although specifically dealing with theology and the Church, Newman's essay is a profound analysis of the continuity through discontinuity present in any long-lasting tradition, with implications for any field of human endeavour which manifests creative interplay between inherited tradition, rational reflection and the wider social circumstances in which it is located. Doubtless many fields do manifest such creative interplay, although it is noteworthy that visual art has largely turned its back on its past achievements. Newman shows that the success of a tradition is related to its ability to assimilate new data, while conserving its past principles and achievements, and also to its ability to develop complex sequences of thought and practice while anticipating future development. He brings to the study of tradition a subtlety and a comparative perspective often lacking in the blanket statements of self-professed traditionalists and antitraditionalists alike.

Tragedy

Tragedy is primarily a type of drama, though non-dramatic poetry ('lyric tragedy') and some novels (for example, Moby Dick) have laid claim to the description. As a genre, it began in ancient Greece and forms a part of the western European tradition. Historically, it has carried prestige for playwrights and actors because it dealt with persons, generally men, of 'high' or noble birth, who, by virtue of their stature, represented the most profound sufferings and conflicts of humanity, both morally and metaphysically. The history of the genre is part of the history of how art and culture reflect views about class and gender.

Tragic theory has concentrated primarily on how to define the genre. A persistent feature is the tragic hero, who begins by occupying a position of power or nobility, but comes to a catastrophic end through some action of his own. According to the Aristotelian tradition, the audience is supposed to experience pity and fear in response to the sufferings of the tragic hero, and perhaps pleasure from its cathartic effects. Hegel initiated a paradigm shift in tragic theory in proposing that tragic plots essentially involve conflicts of duty rather than suffering.

Greek tragedy and Shakespearean tragedy provide two different exemplars of the genre. The tradition inspired by Greek tragedy emphasized a rigidly defined genre of dramatic poetry; French neoclassic tragedy is part of this tradition. Shakespearean tragedy, on the other hand, is written partly in prose, and includes comic elements and characters who are not nobly born. Lessing and Ibsen also resisted restraints imposed on the genre in terms of its representation of social class and gender in favour of drama that was more realistic and relevant to a bourgeois audience. Twentieth-century criticism has questioned the viability of the genre for modern times.

1 Greek tragedy to Plato

Greek tragedy sprang from dithyrambs (choral songs to Dionysus); when dialogue was included in these, tragedy developed as a distinct genre. In about 534 BC the poet Thespis is said to have introduced dialogue between the chorus (or its representative) and a choral leader, and in about 500 BC Aeschylus introduced a second actor, thereby making dialogue independent of the chorus. Either could be seen as the originator of tragedy. Tragedy was considered to be a kind of poetry; poets, and hence tragedians, were regarded as teachers of morality and religion, and tragedies were performed at annual festivals rich with civic and religious significance. The classic tragedies of Aeschylus, Sophocles and Euripides, all written in the fifth century BC, dramatize well-known myths involving important and powerful families, sometimes in altered forms. There were no female tragedians and all roles were performed by men, including those of female characters. Tragedy arose out of ritual, and the exclusively male participation in ritual reinforced a gender-linked social hierarchy.

Gorgias of Leontini, Sicily, held that tragedy (and other poetry) produced pleasure through deception. He also recognized the two main emotions generally associated with tragedy - pity and fear - though it remains unclear why precisely these two were singled out as characteristic of the genre. Plato argued that poetry was imitation, not necessarily deception. Nevertheless, he argued that writing, performing and witnessing performances of poetry could have undesirable, damaging effects on our ability to reason. In his early dialogue *Ion*, he argued that one writes good poetry and performs (recites) it well by 'divine inspiration', not rational understanding. He also argued that our emotional responses to poetry are not rational.

Plato refused to allow imitative or mimetic poetry (as opposed to narrative poetry) into the Republic, his ideal state. One reason was that poetry often portrays things that are not true and describes gods doing things that are not good models for behaviour (*Republic* 387b *et passim*). Another was that most people enjoy giving vent to emotions; we do not enjoy representations of intelligent and temperate dispositions (*Republic* 604e), but what we do enjoy vicariously tends to become part of ourselves (*Republic* 606b). The audience's vicarious pleasure in experiencing appetites (for example, sex) and pains and pleasures 'of the soul' (anger) strengthens those appetites when they ought to be weakened and brought under the control of reason (*Republic* 606d).

2 From Aristotle to Rome

Aristotle's *Poetics* is probably the single most influential work on tragedy ever written (see Aristotle). In contrast to Plato, Aristotle argued that writing tragedy required an understanding of the functions of tragedy and of the principles that ensure that those functions are fulfilled. Writing good tragedy thus develops reason. He also argued

that some pleasure gained from tragedy derives from learning about the things imitated, so that responses to it are cognitively rewarding.

Aristotle's famous definition of tragedy at the beginning of chapter six of the *Poetics* differentiates it from other types of imitation (painting, music, dithyramb, epic, comedy): 'Tragedy is an imitation of an action that is serious, complete, and possessing magnitude; in embellished language; …in the mode of action and not narrated; and effecting through pity and fear the catharsis of such emotions' (1449b24-28). Aristotle also held that tragedy has an end or purpose (*telos*), but there is controversy about what this is. Is its purpose to produce pity and fear, a catharsis, or pleasure (through imitation, pity and fear, and/or catharsis), or is it possibly to construct a plot of the kind which produces the appropriate effect? Aristotle clearly held that only certain kinds of plots will produce the emotions appropriate to tragedy. They are complex plots, involving recognition (of the tragic implications of the action) and reversal (of fortune). Tragic characters must be presented as better people than most and as agents actively affecting the course of action through their own choices, but operating in a world beyond their control.

The suffering that elicits pity and fear comes about through the actions of an agent who makes some kind of mistake or error in judgment (*hamartia*). Even very good people can make mistakes when subjected to forces beyond their control: we thus pity them (since pity is the appropriate response to undeserved misfortune) and fear for them and for ourselves (since if it can happen to people better than ourselves it can certainly happen to us). Aristotle allowed that tragedies could even have happy endings, on the grounds that the *threat* of suffering is capable of generating the 'tragic emotions'.

Historically, catharsis has loomed large in discussions of Aristotle's conception of tragedy, though the passage quoted above contains the *Poetics*' only occurrence of *katharsis* in the relevant sense, and gives no explanation of what it means. *Katharsis* has in fact been translated as both a purging and a clarification. The 'homeopathic' account, in which emotional responses to tragedy purge us of their harmful effects, is probably the most popular. Other accounts of catharsis hold that emotions are rendered pure and clear, so that knowledge of them as psychological states is enhanced; emotions are clarified in the sense that we feel them in response to their proper objects, that is, we pity and fear the right kinds of things; and emotional responses clarify our understanding of the structure of the plot (see Katharsis).

Tragedies were written during Roman times, notably by the Roman Stoic politician and philosopher Seneca. He emphasized the nobility of suffering and gave little attention to action. His works were filled with rhetorical conceits, and are now generally held to be affected, sentimental and bombastic. Horace's *Ars Poetica* proposed that poetry (including tragedy) is *utile dulce*, 'delightful instruction': poetry is seen here as a form of rhetoric that is styled to give pleasure and moral instruction.

3 Italy and France

Seneca's influence was significant, especially in fifteenth- and sixteenth-century Italy and in seventeenth-century France. In Italy, the sixteenth century saw the development of 'true' tragedy, with the playwright Torquato Tasso emerging as the major figure. Though animated by religious ideals, he tried to adhere to the prescriptions of Aristotle and Horace. French tragedy of this period consisted of a great deal of declamation and little action, and is widely regarded as an insignificant precursor to the neoclassical drama of Corneille and Racine, which also showed Senecan influence.

From the time of its first Latin translation in 1498, Aristotle's *Poetics* had substantial influence. Inspired by Aristotle, Bernardino Daniello formulated the Doctrine of Fixed Forms (1536) and Lodovico Castelvetro invented the three unities of time, place and action (1576): the action must take place during a single day, in a single place, and there should be only one main plot with no subplots. Castelvetro also argued that pleasure is tragedy's proper end; if instruction were its end, it would be a utilitarian art. Other rules acquiring more limited acceptance were that the ending should be unhappy, the performance time should be the same as the time of the action, there should be five acts, and no death or violence should take place on stage. Culminating with Nicholas Boileau-Despréaux (*L'art poëtique*, 1674), French theorists entrenched the rules developed by sixteenth-century Italians as absolute and unchanging standards for the production and evaluation of tragedy, though exactly which rules and how absolute their status became issues of continuing controversy.

Corneille and Racine were rivals for the title of pre-eminent dramatist of their day. Racine was best known for his

literary craft, but Corneille, whose most notable tragedy was *Le Cid*, also wrote essays (*Discourses*). Corneilleargued that we should recognize that many tragedies are effective even though they do not obey strict Aristotelian rules. However, it was still the function of poets to please according to the rules of their art, and their art included more than the three unities: for example, the tragic hero must be noble, plays were to be entirely in verse, there were to be no representations of violence on stage and no more than three speaking characters on stage at once. There was, moreover, more concern with general character types than the psychology of individuals. Plays were still declamatory in style, and extolled the virtues of reason or will in the face of the temptation to be ruled by passion. They were thus part of the Cartesian rationalist spirit, following up Plato’s praise of reason and critiques of pleasure and emotion.

4 England

In *The Monk’s Tale*, Geoffrey Chaucer provided a famous definition of tragedy as a (narrative) story of one who falls from prosperity into misery (teaching us not to trust our temporary good fortune). Sir Philip Sidney (*An Apology for Poetry*, 1598) argued that emotional responses to tragedy are morally useful because they move us to want to know and do what is good. He held that our admiration and commiseration teach us about the uncertainties of this world, but that fear is felt only by royal spectators!

The tragedies of William Shakespeare are now viewed as hallmarks of the genre. In a major break from both Greek and Roman tragedy and the morality plays of the Middle Ages, Shakespeare’s plays explore the psychology and actions of individuals, rather than general character types. Writing and acting were still male preserves, and women did not act female roles in England until the Restoration.

One topic of recurrent speculation among English theorists is the so-called paradox of tragedy: how and why do we enjoy being moved by scenes of pity, fear, suffering, and distress? Thomas Hobbes, true to his psychological egoism, suggested that the pleasure is of the thank-God-it’s-not-me sort: the suffering of the tragic hero makes spectators appreciate their own relative security and comfort. Thomas Rymer (1693), who developed the concept of ‘poetic justice’, which requires that the plot must provide a clear moral lesson, held that pleasure arises from the moral appreciation of seeing poetic justice take place.

David Hume’s essay ‘Of Tragedy’ (1757) attempts to explain ‘the unaccountable pleasure…[we] receive from sorrow, terror, anxiety and other passions, that are in themselves disagreeable and uneasy’. He claims that there may be some value in the observation of L’Abbé Du Bos that simply being dislodged from listlessness is itself pleasurable, and in Fontenelle’s idea that the sorrows of the theatre are softened by our recognizing ‘it is nothing but a fiction’. He adds that the eloquence of the poet pleases us and that all imitations please in themselves, so that these new passions predominate over and ‘convert’ the unpleasant ones. Hume’s view was not moralistic, though he asserted that conflicts between our own morality and the morality expressed in the play, and the sight of horrific violence (such as being ‘besmeared all over with mingled blood and gore’), can prevent us from being pleased by the play (see Hume, D.).

5 Germany

In the mid-eighteenth century, Johann Christoph Gottsched led a movement aiming to bring a strict and pedantic version of neoclassic French tragic theory and practice, along the lines of Boileau, to Germany. Tragedy carried literary prestige, but the forms prescribed by the rules were increasingly felt to be forced and unnatural, the elevated diction to be stilted, and the practice of *éloignement* - the distancing of characters and their actions from the audience in status, time and place - to be remote from most people’s experience. Gotthold Ephraim Lessing gradually acknowledged the need to change the forms. His *Miss Sara Sampson* has been called the first really ‘modern’ tragedy; it is written in prose, with fictional (rather than historical) characters from the lower fringe of the nobility, and has a contemporary setting. His *Hamburg Dramaturgy* (1767-8)articulated later ideas about tragedy, notably that the hero should not be admired but pitied, and that tragedy should enhance the audience’s moral awareness through this pity.

Friedrich Schiller’s views (see Schiller, J.C.F. §2) on tragedy grew out of Kantian metaphysics. The ‘play impulse’ unifies the phenomenal world (of determinism) with the noumenal world (of free choice). The tragic hero is not simply determined by physical forces, but challenged by suffering to choose freely what is morally right.

Schiller thought that neoclassic French tragedy erred by overemphasizing reason: to be truly effective tragedy must strike a balance between reason and passion. Both Schiller and Goethe wrote so-called ‘bourgeois tragedies’, spurning the requirement that tragedy should portray persons of noble birth.

A precursor to Hegel, August Schlegel saw as essential to tragedy the conflict between our aspirations to know both the (noumenal) infinite and our own (phenomenal) finite existence. Our pleasure derives from the affirmation of human striving for something beyond ourselves, even though we suffer in the effort. Goethe’s *Faust* could be considered tragedy on this account. Hegel himself transformed tragic theory by focusing on conflict and by de-emphasizing the role of suffering, emotion, pleasure and purgation. Conflicts arise between parents and children, or between the family and the state or ruler, because of one-sidedness: each party ignores the rights of the other. Tragedies can end with a peaceful reconciliation, at which the tragic hero submits to a course of action that he has previously fundamentally opposed. In these resolutions, what is justified on each side is preserved. Among his examples are the *Eumenides*, where claims of contending powers are adjusted, and *Oedipus Coloneus*, where Oedipus accepts as just the exile which is his fate. Thus, Hegel’s dialectical notion of tragedy looks to the (rational) reconciliation of conflicting ethical claims, in contrast with the ancient concept which saw people as victims of unpredictable, irrational forces.

Arthur Schopenhauer (§§4-6) borrowed from Buddhist philosophy the idea of nirvana - the state of release from the compulsions of human will and desire. In Schopenhauer’s writings, will is a blind, irrational cosmic force and its unceasing demands are responsible for all the suffering in the world. The essence of tragedy is suffering, and not action and conflict, as Hegel proposed. The greatest tragedies show the resignation and surrender of the will, including the will to live. It is not replaced by a will to die, he adds, but by disinterested pleasure in the momentary release from ‘the penal servitude of willing’.

Friedrich Nietzsche’s *The Birth of Tragedy* (1872) portrayed two forces at work in human nature. The Apollonian force is calm, orderly, structured, harmonious, rational. It exemplifies the glory of the individual and the wisdom of the ancient Greek maxim, ‘Know thyself.’ The Dionysian force is, by contrast, intoxicated, irrational, aggressive, disorderly, destructive, wilful. The tragic hero represents the Apollonian side, and the chorus - where the individual disappears - the Dionysian. The hero is annihilated, but in this destruction of the individual there exists an affirmation of (Dionysian) life in a cosmic sense. Nietzsche thus rejected Schopenhauer’s resignation to fate and instead championed the joyful identification with nature, no longer limited by concerns for self (see Nietzsche, F.).

6 The twentieth century

Henrik Ibsen gave his 1879 play *A Doll’s House* the subtitle ‘A Modern Tragedy’, though the heroine Nora embodies a (Hegelian) conflict of respect for authority and being true to one’s own feelings. But the play is modern in its middle class, domestic, contemporary setting, its use of prose and its recognition of the rights of women. That women could be tragic figures, representing humankind and the conflicts that plague us all, was an extraordinary advance.

A.C. Bradley defended a fundamentally Hegelian analysis of tragedy in ‘Hegel’s Theory of Tragedy’ (1909). He agreed with Hegel’s emphasis on conflict rather than suffering, but argued that some conflicts depend not only on the character of the agents but on fate, and result from warring between good and evil, rather than just conflicts between different goods.

Miguel de Unamuno (1913) proposed that tragedy was a way of looking at life, and many writings of the twentieth century emphasize a ‘tragic vision’ or ‘tragic sense’ rather than its essential properties as a literary genre. For example, Joseph Wood Krutch’s impassioned essay ‘The Tragic Fallacy’ (1929) held it a fallacy to attribute nobility to actions themselves, as an objective property of certain actions. Rather, tragedy represents human actions *as* noble. Tragedy satisfies the ‘universally human desire to find in the world some justice, some meaning, or, at the very least, some recognizable order’. He claims that Ibsen presented life as trivial and meaningless, and hence that his work lacked the tragic spirit that expressed the value of human life, rather than despair.

Several forces emerged in the twentieth century to question the viability and relevance of tragedy as a genre. Ibsen’s ‘democratization’ of tragedy (with its own precursors in German ‘bourgeois tragedy’) rejected rigid class structures and gender roles. Marxist and feminist theories undermine the concept of a tragic hero as an independent

agent responsible for the course of the 'tragic action'. Bertolt Brecht, himself a Marxist, encouraged a stylized form of acting which produces an intellectualized rather than emotional response. This is reminiscent of early French neoclassic tragic acting, but to an opposite end: whereas the French reaffirmed the power of an individual's rationality to guide their fate, Brecht saw the individual as alienated from the social forces that determine the course of history. The Absurdists (Ionesco, Genet, Beckett, Pinter) depicted the world as meaningless and refused to represent human actions, in Krutch's words, *as* noble. In general, the side of tragedy consisting of a positive affirmation of human life, of value, of the power and nobility of the individual, has been subdued. But forces working in the late twentieth century for the empowerment of and respect for difference among traditionally marginalized and disempowered peoples - women, people of colour, and cultural minorities of all types - create an environment in which a new set of values could provide a foundation for the affirmation of human worth which tragedy entails.

Transcendental arguments

Transcendental arguments seek to answer scepticism by showing that the things doubted by a sceptic are in fact preconditions for the scepticism to make sense. Hence the scepticism is either meaningless or false. A transcendental argument works by finding the preconditions of meaningful thought or judgment. For example, scepticism about other minds suggests that only the thinker themselves might have sensations. A transcendental argument which answered this scepticism would show that a precondition for thinking oneself to have sensations is that others do so as well. Expressing the scepticism involves thinking oneself to have sensations; and the argument shows that if this thought is expressible, then it is also false.

Arguments with such powerful consequences have, unsurprisingly, been much criticized. One criticism is that it is not possible to discover the necessary conditions of judgment. Another is that transcendental arguments can only show us how we have to think, whereas defeating scepticism involves showing instead how things really are.

1 Nature of argument

The name ‘transcendental argument’ originally comes from Kant, who called the most difficult part of his most difficult work a ‘transcendental deduction’ (see Kant, I. §6). In the twentieth century, the name has been applied by both proponents and critics to a loosely similar set of arguments, sometimes directly inspired by Kant, sometimes not. The central figure in re-launching such arguments was P.F. Strawson in his work on metaphysics, *Individuals* (1959), and his reconstruction of Kant, *The Bounds of Sense* (1966) (see Strawson, P.F. §8). Subsequently the work of Davidson, Putnam and Searle on the relations between language and the world has been called ‘transcendental argument’ both by themselves and by others; indeed Richard Rorty calls Davidson’s argument a ‘ transcendental argument to end all transcendental arguments’ (Bieri, Horstmann and Krüger 1979: 78).

One example of a transcendental argument is Strawson’s attack on scepticism about other minds. He maintains that the ability to attribute mental states to others is a precondition for attributing mental states to oneself. Therefore, if the scepticism is stated in its standard form of wondering whether anyone apart from the thinker has thoughts or feelings, it is also answerable. For the argument shows that a precondition for any such wondering is that we also attribute such states to others. Hence, if scepticism makes sense at all, it is mistaken; the sceptic is reduced to either error or silence.

This particular example is a kind of private language argument (see Private language argument). Wittgenstein has retrospectively been seen as having made these kinds or arguments, as more obviously and recently has Donald Davidson,. The closest analogy to them in Kant is not the *Transcendental Deduction* but, rather, the *Refutation of Idealism*, where Kant argued that knowledge of outer states is a precondition for knowledge of inner states, and hence claimed that ‘the game played by idealism has been turned against itself’ (1781/1787: B276). As in Strawson, the way that the sceptical position (here idealism) enters the game means that it can be defeated.

This briefly sketched family of arguments illustrates several things about modern transcendental arguments. They are arguments about the preconditions of thought or judgment. They start with a supposition about our thoughts, such as that we have thoughts of some particular kind. A necessary condition for having such thoughts is then derived, followed by a necessary condition for this necessary condition, and so on. Assuming that the first assumption is correct, all its necessary conditions will then have been found also to apply.

2 Problems

As an answer to scepticism, a transcendental argument is only as strong as its initial assumption. In the example in §1 above, the assumption is that we think ourselves to have mental states. However, a sceptic could try to meet this by claiming that we might be mistaken about the content of our thoughts. Similarly Putnam’s transcendental argument that we would not even be able to think that we were seeing an apple unless this kind of state was typically caused by real apples (and hence that external-world scepticism must be false) could be met by doubting whether I correctly identify my thoughts as being of the apple variety.

If, however, the initial assumption is not about the contents of thoughts but is just that there is thought (or
